## THE GRAM-POSITIVE ANAEROBES IN APPENDICITIS AND ITS COMPLICATIONS \*†

By JOHN E JENNINGS, M D, F A C S,

BROOKLYN, N Y

WE are accustomed to think of appendicitis as a disease rather well under surgical control and if the diagnosis be made early and the interference timely, this may be admitted, in theory at least. Unfortunately, in practice, it still takes its toll of lives, and although the complicating peritonitis is no longer so hopeless as it was, it is still a dreaded condition, and in no small number of cases does not yield to the measures at our command. The mortality of diffuse peritonitis secondary to gangrenous or suppurative appendicitis in the best of hands, is not below 20 per cent.

The association of this localized gangrenous process in the appendix with the gram-positive anaerobic organisms, which are found with putrid gas gangrene in contaminated gunshot wounds, has been noted by several observers. The opinion has prevailed, however, that this contamination, if one may so call it, was due to a gross perforation of the bowel wall and that, save in rare instances, it was not to be considered as of clinical import. This opinion, however, has not been by any means established.

Simonds, writing in 1915, in his monograph on the *Bacillus Welchii*, says "The relation of anaerobes in general and of *Bacillus Welchii* in particular, to appendicitis is still unsettled." His review of the literature of *Bacillus Welchii* infection up to that time is extensive and complete.

Veillon and Zuber made a valuable contribution in 1898 in which they first definitely noted the presence of *Bacillus Welchii*, which they called *Bacillus Perfringens*, in infections of the appendix. Their conclusions are worth translating and transcribing. The suppurative infections of the appendix, in which the organ is gangrenous, perforated or on the point of being so, in which the pus has a markedly fetid odor, contain in abundance anaerobic micro-organisms which we have been able to isolate and describe.

When they contain streptococci and colon bacilli, which is not absolutely constant, these latter organisms are always present in infinitesimal quantity in proportion to the others.

Welch records thirteen cases of diffuse peritonitis in which *Bacillus Welchii* was found. Ten of these were perforative and three non-perforative cases and he also notes the presence in two cases of circumscribed gas containing intra-peritoneal abscesses resulting from perforation of the appendix verimormis.

Flexner made cultures at various times post-mortem, from sixty cases of endogenous peritonitis and found *Bacillus Welchii* in eight cases, usually in mixed cultures. His work done in 1898 seems quite primitive and not at all complete.

Wright and Stokes isolated the organism in pure culture from peritonitis complicating typhoid as did also Hitschmann and Lindenthal and Von Hibler, and a number of other observers have found it in cases of peritonitis of various types.

Dudgeon and Sargent made a study of the bacteriology of appendicitis in England in 1905, in which they came to the conclusion that the *Bacillus coli* was the most frequent cause. They did not believe that anaerobic bacteria played any important rôle in appendicitis or peritonitis. They believed that if *Bacillus Welchii* was frequently present in cases of appendicitis, emphysematous gangrene of the bowel should be a common lesion instead of an interesting curiosity, and that foaming viscera should be seen very frequently at autopsies on patients dead from appendicitis. Instead there was only one case of foaming organs in such cases among the autopsies at St. Thomas' Hospital in one year, 1905. They found themselves quite unable to grow streptococci, but cultivated staphylococci and pyocyanus with their colon bacilli. Their work would be negligible were it not that it would seem to have diverted attention from the study

\* Read before the Annual Meeting of the Medical Society of the State of New York at Rochester, N Y, April 23, 1924.

† From the Surgical Department of the Brooklyn Hospital.

of the significance of the anaerobes in this disease

On the other hand, Lanz and Tavel found in 138 cases of appendicitis bacillus edematis maligni in forty-nine, classing under bacillus edematis maligni various anaerobes, including bacillus Welchii

Runeberg in 1908 found bacillus Welchii once in fourteen cases of appendicitis. He believed that anaerobes played an important part in appendicitis and peritonitis by the production of toxins rather than by actually taking part in the infection

Heyde, of Frederick's clinic in Marburg, in 1911 published a monograph on the anaerobes in appendicitis. He concluded that anaerobic bacteria were present in one hundred out of 102 cases studied and that they were present in greater profusion than anaerobes in all stages of appendicitis and peritonitis, and attributed to them the direct causation of inflammation, of gangrene and of toxemia. He found that the perfringens group (bacillus Welchii) outstripped all others in rapidity of growth

Grigoroff studied eighteen normal and thirty-one diseased appendices. In the normal appendices, aerobes and anaerobic specimens were present in approximately equal proportions, or aerobic organisms were more abundant. In the inflamed appendices, however, the strictly anaerobic bacteria were strikingly predominant. In the thirty-one cases of appendicitis bacillus perfringens (bacillus Welchii) was found nine times

It seems quite clearly demonstrated that the gram-positive anaerobes are unable to attack living healthy tissues, although they grow with vigor in devitalized structures

Cramer and Gye found that anaerobic organisms freed from toxins were unable to set up an infection in an animal of a susceptible species

A mixture of a sublethal dose of toxin and an emulsion of these organisms, on the other hand, invariably caused death. The defense is due to

- 1 Extra-cellular lysis
- 2 Phagocytosis

and is sufficient to prevent the bacteria from developing their pathological action, namely, secreting a toxin

In order to produce the specific disease from the toxin free bacteria, it is necessary to make a breach in the defenses of the body, which can be done by the injection of definite chemical substances such as calcium salts, organic or inorganic colloids or distilled water. Their observations were directed to wound infection, as, indeed, are most studies of these infections and

emphasize the influence of contamination with calcium-containing soils

Lardenais and Baumel, discussing gangrenous infection of war wounds, say: "These organisms may exist alone, but in practice and especially in severe cases they are associated with one another or with aerobic organisms"

The most serious association is undoubtedly that which occurs with the streptococcus. This combination with the streptococcus, and anaerobic association, is extremely interesting from the point of view of general pathology. In fact the streptococcus alone, even in very great abundance, is much less serious than the association of streptococcus plus anaerobic bacilli

This fact struck us immediately and it is manifested especially in certain phases of Infections Gangrenous on which, in our opinion, insufficient emphasis has been laid

An aerobic microbe, in possessing itself of the oxygen of the tissues and diverting toward itself the phagocytic activity, permits the multiplication of an associated anaerobe. By their association these microbes may be functionally modified both in their zynogenic and in their toxico-genic actions. The fact is well known for tetanus, and it has been proven that the streptococcus induces the bacillus diphtheriae, for example, to secrete a greater quantity of toxin

The streptococcus increases the virulence of the anaerobes which produce gangrene. As Grasset has very truly said: "One must not consider microbic association as a simple collaboration in an inert and impartial subject. The reaction of an organism to a mixed infection is not the sum of the respective reactions of that organism to each of the microbes present. It is a new ensemble of reactions, it is a new disease"

It has been usual to consider the streptococcus as the more common invading organism in appendicitis, with the colon bacillus, staphylococcus and pneumococcus less frequent offenders

In appendicitis, however, we have a contaminated infection from the first and it seemed reasonable to suspect that given an invading organism, like the streptococcus and a breach in the mucous membrane which separates the physiologic exterior of the body, the lumen of the gut from the interior, that the anaerobes might well be found as invaders themselves, and in fact we have been able to demonstrate that this is the case. We have found, in sections of appendices, the seat of gangrene gram-positive organisms showing the characteristic forms of these organisms invading tissue not as yet gangrenous, and have isolated them by cultivation of tissue removed from without in such a way as to avoid contamination from the lumen of the organ

Several questions have arisen, i.e.

1 To what extent may gangrene producing organisms be considered responsible for gangrene of the appendix? It has been the rule to consider this lesion as due to the strangulation of the organ by the oedema of the inflammation caused by the infection and the actual putrid gangrene with or without gross perforation, as a secondary affair. We are prepared to say that our studies lead us to consider gangrenous appendicitis as an infection by the gas gangrene producing organism superimposed on the so-called catarrhal or suppurative appendicitis due to streptococci or other invasion.

2 What is the relation of the anaerobes to the local, walled-off suppurative process, the so-called appendicular abscess? We have limited our studies, for the most part, to the bacillus Welchii for several reasons. *First*, we had available an antitoxin against it and our aim was in the beginning, to evaluate its use. *Second*, we believed that the bacillus Welchii to be the most numerous and probably the most common organism with which we had to deal, and *third*, we were able, with the means at our command, to recognize its presence more promptly than other organisms, such as the vibrios septique, the oedematiens, etc. We have fully realized the limited scope of such an approach, but it seemed a practical method of attack.

We have found the bacillus Welchii almost constantly present in the gangrenous abscess and except in massive collections it has, as a rule, seemed a quite harmless contamination. In several very large abscesses, however, we have noted profound intoxication associated with its presence in great numbers.

It is to be emphasized that its presence is not necessarily associated with gas formation.

It may be interesting, in this connection, to note the results of studies made by Lardenais and Baumel on the Gangrenous Infections of the Extremities in War Wounds. They noted the following varieties of anaerobic infections.

1 Anaerobic infections which cause swelling of the muscles and which kill the patient in 24 hours without producing any special odor of gangrene, without the apparent existence of tissue destruction or of gas at autopsy, after the most careful search.

2 White, odorless oedema without gas which infiltrate an extremity and which carry off the patient although one can find no important muscular lesion.

3 Circumscribed infections with gangrenous muscle covered with a yellowish necrotic membrane separating it in sheets, liquified and foul smelling, although the general condition seems relatively slightly affected.

4 Purulent gas containing abscesses circumscribed plugmous so often benign.

All of which may merge into the most characteristic diffuse gas gangrene.

It is evident that the natural history of these infections of the intestinal wall and the peritoneal cavity, presents quite a different picture from that of wounds of the extremities.

In cases of a leaking abscess or spreading peritonitis there are found at operation two different sorts of fluid in the peritoneal cavity, a free fluid, varying from serous, straw-colored, more or less turbid fluid in greater or less amount, and a local, more or less walled-off cavity containing foul, gray or dark colored pus. We have found cases in which the bacillus Welchii was present in both fluids, cases in which it was present only in the abscess cavity and a few cases in which it was present in neither.

What is the relation to diffuse peritonitis?

1 We have found it present in large numbers in fatal cases associated with toxic symptoms not unlike those associated with fatal gas gangrene of the extremities.

2 We have found it present in peritoneal fluid with symptoms of intoxication and have noted the relief of the toxic symptoms on administration of the antitoxin available.

3 We have found it present in the peritoneal fluid and have noted the remission of toxic symptoms following the use of antitoxin, but have been unable to control the peritonitis with the classical fatal issue.

4 We have noted its presence, given the antitoxin and found it quite useless. An intoxication apparently due to another toxin.

The cases of diffuse peritonitis in which the anaerobes are present in numbers show a more or less typical clinical picture. The temperature is not as a rule much elevated, the pulse rate out of ratio, they are cyanotic and the pupil is dilated. A dusky flush may be present.

At section the fluid may be foul or not. A dark colored or coffee ground fluid is sometimes seen. One may find in the region of the base of the cecum an emphysematous retro-peritoneal cellulitis, spreading and sometimes extending to the anterior abdominal wall. The progress of such a case may be quite favorable for from 24 to 48 hours when with comparatively little distension and little or no regurgitant vomiting the pulse becomes rapid and thready, cyanosis becomes more profound, the skin grows clammy, respiration becomes more rapid and death occurs.

One may say that every patient who develops a gangrenous appendicitis is affected with a local process which may spread, allowing the development of toxins, and ending fatally.

Henry and Lacey studied the precipitation of bacillus Welchii toxin.

*Bacillus Welchii* toxin reaches its maximal value in young cultures 12-24 hours old, after which it depreciates very rapidly

The potency of *bacillus Welchii* toxin is much less than that of diphtheria or tetanus. A good *bacillus Welchii* toxin, when grown on meat broth, is one with a lethal dose for mice of 0.1 cc. By precipitation with ammonium sulphate and alcohol and re-solution a concentration of from 50 to 250 mouse minimal lethal doses per 1 cc. were obtained. Stored in amber colored bottles with rubber corks a room temperature. No deterioration in over 11 months.

De Krief showed that the toxin of the bacillus exercised a very definite aggressive action on the bacilli. As the bacteria multiply, the symptoms of intoxication become manifest and are the same as those observed when sub-lethal doses of toxin are injected into the circulation of susceptible animals. They act on the nervous system, producing tremor, slight convulsion, hic-cough, bristling of hair, constipation by paralysis of the bowel. They affect the circulatory system, as evidenced by the extreme rapidity of the pulse. Before death, paralysis of the hind legs occur and the animal refuses food. It remains hunched up and motionless and its respirations are markedly increased. Death intervenes by respiratory failure rather than by cardiac paralysis.

The lesions are those referable to the muscles, the blood vessels and the fat of the subcutaneous connective tissue. The muscles are first rendered necrotic by contact with the toxin which is a protoplasmic poison. The carbohydrates of the necrotic muscle are then attacked in turn by the saccharolytic ferments of the bacilli which produce gas and acids. The gas infiltration results from this change. The oedema which occurs, has been ascribed by some authors to the acid produced, whereas others maintain that it is due to the pressure of the infiltrating gas. The toxin seems to exert a specific effect on the muscle fibres of the media coat of the blood vessels, with a tendency to rupture of the blood vessels and consequent hemorrhage. The exuded blood is hemolyzed by the hemolytic substance secreted by the *bacillus Welchii*. This diffusion of caked blood is particularly noticeable with toxic strains.

Exactly what is the relation of the presence of the gram-positive anaerobes to toxemia?

In many instances, in fact in most of the cases of appendicitis, they would seem to be comparatively innocent bystanders. Present in the lumen of practically all appendices removed at operation and in the pus of gangrenous abscesses almost without exception. They are found with fair regularity in the foul pus of drained cases without any evidence of toxic effect.

They may however be found in the free fluid of a disseminated peritonitis, in sacculated and

undrained collections of pus within the abdomen and associated with other organisms, notably the streptococcus, in a retroperitoneal cellulitis, such numbers and accompanied with such a degree of intoxication as to very strongly suggest a causal relation. The symptomatology of a perforative peritonitis advancing to a fatal issue, simulates quite closely the picture of a case of gas gangrene and of the intoxication produced by the experimental injection of the toxin in guinea pigs.

The surgeon enters a race with death. He knows this. He has known it now many years, and in the amputation of the appendix he removed the focus, if it is still limited to the organ. If the anaerobes have spread beyond the appendix, the process may be localized or general in the peritoneal cavity and the degree of virulence has evidently a wider range.

### CLINICAL

We believe that the greater number of patients who die of peritonitis secondary to appendicitis, die of an intoxication and not of an adynamic ileus which has not time to develop, and that the clinical manifestation of this intoxication is not unlike the classical descriptions of gas gangrene.

We believe that the development of such an intoxication may be prevented by prompt and proper surgery and that a certain number of cases in which surgical relief would be unavailing alone may be saved by early and vigorous use of serum treatment.

The treatment of such cases has only served to emphasize what we already knew, namely, the necessity for

- 1 Prompt recognition of appendicitis and prompt appendectomy
- 2 Operative measures carried out so as not to spread the infection
- 3 Adequate drainage
- 4 The Fowler posture with free tube drainage in generalized cases
- 5 Measures to guard against acidosis, and
- 6 The recognition, so far as possible, of the degree of diffusion of anaerobic infection and the use of such antitoxin means as we possess

In a previous paper I have reported a series of cases in which a serum antitoxin to the *Welchii* bacillus was used.

It is evident that this can be but a feeble weapon when a number of equally if not more dangerous organisms may be quite as responsible. It was and is, however, the only one at our command and the measure of its usefulness only, serves to emphasize the need for more work in that direction.

The subject calls for further bacteriologic and clinical study and for more serologic armament than we now possess

### Discussion

LOUIS NERB, BROOKLYN HOSPITAL

In cases of gangrenous appendices, a very important factor is the identification of the different aerobic and anaerobic bacteria. After careful investigation the conclusion was reached that most important among these is the *B. Welchii* or *Bacillus Aerogenes Capsulatus*, commonly known as gas bacillus. The great handicap in such cases was found to be the long process needed to bring about the identification of this anaerobe. Our aim was to shorten as much as possible the time necessary to definitely prove the presence of the *B. Welchii*.

At first the identification was made according to the standard method, by injecting a rabbit with the suspicious material.

Anaerobic agar cultures were run parallel by applying the Wright's Pyrogallic Acid method.

With this method it is impossible to make a definite diagnosis of *B. Welchii* in less than eighteen or twenty-four hours.

Anaerobic milk cultures were then substituted for agar cultures. It was found that the culturing time could be lessened and purer cultures could be depended upon.

At the same time this particular method of culturing can be used for the differentiation of *B. Welchii* and the anaerobic bacillus *Vibrio Septique* or *Bacillus of Malignant Oedema*. This latter type of anaerobe grows under practically the same condition as *B. Welchii*, except that it does not show the violent explosion in the milk, but forms an almost solid coagulum in the clear whey. In acute appendices, separate cultures were taken from the lumen, the mucosa, and the submucosa of the appendix, also from the peritoneal fluid nearest the gangrenous lesion. Most important is the discovery of the presence of the *B. Welchii* in the peritoneal fluid in the shortest possible time.

The first experiment in the attempt to shorten the time was to inject into the livers of five guinea pigs, an active, live culture of *B. Welchii*. The pigs were killed and placed in the incubator. After three hours an autopsy was performed on one pig and then on the others at intervals of one hour.

Smears and cultures were taken from the liver, the bloody peritoneal fluid and the heart's blood of each animal. The *B. Welchii* were found in all these smears and cultures, but there were no

marked changes in the organs of the animals. This experiment proved that *B. Welchii* could be found in as short a time as three hours after the injection in the liver. To prove that the *B. Welchii* in the heart's blood was the *B. Welchii* that was injected in the liver and not the result of a ruptured intestine or a post mortem result, the following experiment was made.

The same number of animals were injected individually with sterile saline, different kinds of staphylococci, *B. Coli*, and streptococci. Autopsies were performed as before—the first after three hours and the others at intervals of one hour. The *B. Welchii* could not be detected in smears or cultures from these animals.

The next step was the injection of animals with different dilutions of a live culture of *B. Welchii* mixed with a twenty-four hour culture of *B. Coli*.

The dilutions were made in concentrations of one hundred, one thousand, and ten thousand organisms per cc. The pigs were injected in the liver with these dilutions, and autopsies performed after two hours. The *B. Welchii* could be easily seen in smears taken from the liver, the bloody peritoneal fluid, and from the heart itself. Pure anaerobic cultures of *B. Welchii* were obtained in this experiment. The bacteria were most numerous in the bloody peritoneal fluid. The conclusion was therefore, that by producing a trauma in the liver with a twist of the needle, making a more bloody exudate, the bacteria would be more numerous.

The actual work was done as follows. Suspicious material, especially from acute appendices, was emulsified with sterile broth, part injected with a hypodermic syringe and a twenty-gauge needle into both lobes of the liver of a guinea pig, and part cultured in the described way. The guinea pig was killed and placed in the incubator. An autopsy was performed two hours later and smears were taken from the bloody peritoneal fluid, the liver itself and from the heart. In positive cases the *B. Welchii* could be easily seen. According to our records there were 97 per cent positive findings in animals after two hours, compared with the positive anaerobic milk cultures. This slight difference may be explained by an error of the proper technique, in as much as the animal injections were not always made by the same person.

Using the anaerobic milk culture as a check on the smear from the peritoneal fluid, the conclusion is that the presence of *B. Welchii* may be definitely proven within two hours after receiving the suspicious material.

# THE CONVULSIVE TOXEMIA OF PREGNANCY AND ITS TREATMENT\*

By ROSS McPHERSON, M.D., F.A.C.S.,

NEW YORK CITY

A REQUEST from the chairman of a section for a paper on a definite subject is, of course, tantamount to a command, so that when the chairman of this section asked me to read on the Convulsive Toxemia of Pregnancy and its treatment, I could not well refuse, although I am sure that many of my audience are already weary of hearing me talk on this subject. Since the publication in 1916 of my first paper on the conservative treatment of convulsive toxemia of pregnancy, there has been in this country such a rapid spread of this method of handling the complication, that it is a great source of gratification to the reader to feel that, in some small measure, at least, he has been responsible for the more general adoption of the less radical procedures, with the consequent lowering of maternal and fetal morbidity and mortality. Indeed, at a large medical meeting held in New York City only two weeks ago, where the subject for the evening was the same as the one with which we are dealing today, and where prominent obstetricians from three different cities were present—Philadelphia, Baltimore and New York—the general and practically unanimous opinion was in favor of the adoption of the more conservative methods, and the elimination of radical methods in dealing with the convulsive toxemias of pregnancy, except in a very few cases.

There still remain in every community, however, a few practitioners, who, either from timidity (for it requires courage to depart from the beaten path into unknown territory in treating a condition as terrifying to physician and lay observer alike as in a convulsive toxemia), or lack of initiative or some other equally invalid reason, refuse to adopt either the careful prophylaxis that should be practiced during the prenatal state, thus avoiding the toxemia later, or the conservative method of treatment which should prevail when the complication has arisen, and it is these last few prodigals that the reader wishes to gather into the family circle.

Quoting from an article on this subject read by me at the annual meeting of the Massachusetts Medical Society at Pittsfield, Mass., in June, 1923:

Eclampsia, otherwise and more correctly known as the conservative toxemia of the pregnant woman, has always been regarded as one of the most baffling conditions with which the physician has had to deal. Coming on with its lightning-like suddenness and, as was formerly supposed, in the absence of premonitory signs—

signs which we have lately learned are present and usually can be recognized both by means of better methods of diagnosis and a more accurate and thoughtful study of the complication—it was, and still is, enough to strike terror into the mind not only of the lay observer but also of the medical attendant, and, as with the introduction of modern surgical methods it became easier and more simple to empty the uterus with speed, it is small wonder that operative intervention in these cases became the accepted and approved method of handling them. Appearing in the pregnant state, what could be more natural and reasonable than the theory that the pregnancy must be the cause of the condition and that, therefore, to help the patient, the provoking cause must be removed, a theory which seems sound and to a certain extent undoubtedly is.

Whether or not, however, the practice in popular vogue is always the best for obtaining this result is the matter before us for consideration today, and with your permission, I would like to take up the subject in the following order: 1 Frequency of occurrence of eclampsia, 2 symptoms, 3 the pathology, 4 the treatments commonly in vogue, both past and present, with the idea of placing the complication on a more rational basis.

Williams<sup>1</sup> in his textbook considers that an eclampsia occurs once in 130 cases, Cragin<sup>2</sup>, once in 79 cases, and other authors in about the same proportion. At the New York Lying-In Hospital, in 120,000 cases we had 890 eclampsias. This shows that we may expect in hospital practice to see a case of this description once in about 185 patients. The season of the year apparently has some importance in this connection, as the cases are noted more frequently in the early spring than at other times, and also greater numbers are seen some years than others. Its occurrence is almost twice as common in primiparae as in multiparae (64.4 per cent and 35.6 per cent respectively), and as might be expected, much more frequent in antepartum than in postpartum or intrapartum patients.

The greatest number of cases are noted between the ages of 20 and 25 years, which is in accord with the statement that the greater number occur in primiparae.

The symptoms may be divided into (a) the premonitory or pre-eclamptic, and (b) those occurring after the convulsive seizure has taken place. Of these the pre-eclamptic warnings are the most important, as like storm signals at sea, if properly noted in time, preparation for the approaching tempest can be made, and often a port reached, which will frequently though not

\* Read at the annual meeting of the Medical Society of the State of New York at Rochester, April 23, 1924.

always, as some authors have said, enable us to avoid the storm altogether

It is difficult to put in the proper order of their importance the pre-eclamptic signs and symptoms, many authorities disagreeing markedly on this point, but to the reader it seems that by far the most constant and most significant warning of an impending toxic state in the pregnant woman is found in the blood pressure. In an otherwise normal patient, a sudden and permanent rise in the blood pressure is to be looked on with alarm and is never of slight importance.

Next in order we have the condition of the urine, not so much from the standpoint of the kidneys themselves, as an index of the degree of toxemia from which the patient is suffering, and, thirdly, the results of the ophthalmoscopic examinations of the eyes, which, as they are becoming more common, seem to point out to us a very important piece of information. Edema of the extremities, or of the body in general, tenderness over the gall-bladder, nasal hemorrhage, various digestive disturbances, constipation and so on, are undoubtedly of importance and when present should be carefully noted and if possible treated and corrected, but the increasing blood pressure, the urine examination, both regarding the increase of albumin and the presence of casts, and possibly the nitrogen coefficient (though this is of doubtful value) and the presence of progressive changes noted by the skilled use of the ophthalmoscope, are all that the skilled obstetrician needs to put him on his immediate guard for the onset of the eclamptic seizure. These, when present, with the convulsion, the coma, the cyanosis, the rolling eyes, clenched teeth and other familiar features, need no further description, and we will now proceed to consider the pathology of the complication, in the light of what knowledge we have been able to accumulate during the last few years.

For a long time the disease was thought to be of renal origin, and as such was considered a uremia. More careful and extended observation, however, has shown that the kidney involvement is entirely secondary, as evinced by the fact that we frequently see cases in which, although typical in every other respect, clinically the kidney is not involved, or not until late.

The typical lesions found are those of a degeneration of the parenchymatous organs, notably the liver, followed by the kidney, less commonly by the spleen and pancreas, this takes the form of an albuminous change known as cloudy swelling, passing on to fatty degeneration early in the disease, and later, in the more aggravated forms, extending to all the tissues. In the other toxemias of the non-convulsive type, we find zonal necroses in the liver lobules. These necroses have been described by Schmorl<sup>2</sup> of Germany and Williams<sup>4</sup> in this country.

In eclampsia, on the contrary, we usually find extensive hemorrhages in and about the portal spaces, with very little zonal necrosis in the outer space of the lobule. The hemorrhages are general in character, usually being especially marked in the brain, about the corpus striatum and pons, rupturing into the fourth ventricle.

Welch<sup>5</sup>, formerly pathologist to the New York Lying-In Hospital, explains these hemorrhages by suggesting that there is circulating in the blood a poison which causes agglutination of the red cells, forming emboli, and when the solution of the endothelium of the blood into the tissues. The blood pressure is usually high, especially during the convulsions, a condition which increases the brain hemorrhages occurring in these young subjects who are usually free from arteriosclerosis. Welch believed that the poison causing the intoxication is probably an enzyme or a combination of enzymes which attack the cells and cause their destruction, the process being known as autolysis, this statement is particularly applicable to the liver.

Concerning the immediate sources of the poison, they have been regarded as four in number: the food, fermentations in the intestine, cell metabolism, and the fetus and placenta, with a possible fifth in the kidney. It is a well-known fact that the autopsy reports always invariably show dilated ureters in women dying in advanced pregnancy, and from retention there may be some contributory share. With regard to the part played by the fetus and placenta, little is yet known, and whether they furnish a portion of the enzymes which attack the maternal organism, as has been declared by some, is a question which the biological chemist has not yet answered.

Hunter<sup>6</sup> states that eclampsia is due to a toxin, but what that toxin is has not yet been shown. McGarrison<sup>7</sup>, in his work on the thyroid, gives the following suggestion. Spinal anæsthesia is produced by injecting a local anæsthetic, such as stovaine, into the spinal canal, that is, bringing a paralyzing substance, into contact with the spinal cord. If instead of a paralyzing substance an irritant, like the toxin of eclampsia, is mingled with the cerebrospinal fluid, we would expect the results of irritation, namely, convulsions, as in eclampsia.

If it be true that the eclamptic toxin is to be found in the cerebrospinal fluid, it must get there through the choroid plexus which normally secretes the fluid. The choroid plexus is a true secreting gland, and in health has a selective action which prevents toxic bodies passing from the blood to the cerebrospinal fluid. If from disturbed function this selective action is lost, toxins will pass through the gland to the spinal cord, and those toxins may be the toxins of eclampsia. McGarrison mentions two classes of toxins: (1) Those resulting from endogenous

metabolism and (2) toxins of bacterial action. Possibly the first class, by their presence in the cerebrospinal fluid, is responsible for the symptoms of eclampsia. The kidneys under normal conditions would secrete these toxins. In pregnancy they are much increased in quantity.

From McGarrison's<sup>7</sup> work it seems reasonable that the bacterial toxins may bring about a disordered condition of the thyroid, and that they are originated in the alimentary canal. He mentions the frequency of the enlarged thyroid in pregnancy. The fetus causes increased activity of the thyroid which is more easily disturbed on account of acting under greater pressure. Most obstetricians believe that the toxin of eclampsia is elaborated in the alimentary canal of the mother.

McGarrison<sup>7</sup> concludes that the bacterial toxins elaborated in the alimentary canal are absorbed into the blood and carried to the thyroid apparatus upon which they act injuriously and cause insufficient hormone production. This leads to choroid plexus insufficiency with loss of selective action which permits (toxic) endogenous products of metabolism to enter the cerebrospinal fluid, where they act upon the central nervous system and produce the condition of eclampsia. If this view be correct, the rational treatment would be

- 1 To remove the organisms which form the toxins from the blood
- 2 To remove toxins, both bacterial and metabolic, from the blood
- 3 To remove toxins from the spinal canal
- 4 To supply hormones to activate the choroid plexus
- 5 To treat symptoms as they arise

LaVake<sup>8</sup> states that in the field of obstetrics there is not a more interesting or more important problem than that of the etiology of pre-eclamptic toxemia and eclampsia. He groups the principal theories into 1, bacterial, 2, auto-intoxication, 3, nephritic, 4, liver, 5, ovular and placental.

*The bacterial theory* was presented as early as 1884. The main advocate of this theory has been Stroganoff, and his reasons for advocating are well worth citing. 1 General disease affecting all parenchymatous organs. 2 Acute infection commencing explosively or after a prodrome. 3 Fever accompanies it. 4 One attack confers immunity. 5 Marked genus epidemicus. In 1897, 25 per cent died. In 1898, he had nineteen cases with a zero mortality. 6 It is impossible to explain the increase of eclampsia in populous centers otherwise than by accepting the infection theory. 7 As an argument against the uremic and fetal theories he mentions 126 cases, 10 of which occurred in the early months of pregnancy, and after the cessation of eclamptic seizures the

pregnancy continued to normal termination. This could scarcely occur if eclampsia were due to toxins generated by the fetus. Early eclampsia usually affords the worst prognosis.

*The auto-intoxication theory* was brought forward by Bouchard, laying stress upon the toxins generated in intestinal stasis. He believes this view is tenable only from the standpoint of direct infection or absorption of toxic products resulting from the colon or other intestinal organisms.

*The nephritic theory* lays stress upon the presence of albuminuria and concomitant signs of nephritis with insufficient kidney function, the products of maternal or fetal metabolism being the offenders.

*The liver theory* accounts for the condition by the derangement of the liver structure and function as evidenced by anatomic and functional pathology.

*The ovular and placental theories* maintain the condition to be due to the generation of toxins from the products of conception or to infarcts of chorionic villi, and bring to their standard the force of the necessity of pregnancy in obtaining the condition.

LaVake states that in his experience the great majority of thromboses are caused by infection. For the past six years he has been interested in following cases with general pathologic conditions due to infections and trying to find the possible portal of entry. Obscure cases which clear up after the eradication of foci of infection are heard of every day. It has been proved that muscular pains have disappeared after the removal of infected teeth and tonsils. Cases of neuritis have improved under the same procedure.

Also, the author has been especially impressed by the cases of nephritis which clear up and remain so, after thorough eradication of dental and tonsillar infection.

Instances have been reported of eclampsia in the mother and nephritis in the child. Many have adduced from this that the products of the fetal metabolism causing the nephritis in the child were the cause of the eclampsia in the mother. It has been shown that organisms can pass from mother to child and it is possible that an infection was the cause of both conditions. Streptococci are the most common bacteria found in tooth and tonsillar infections, and their presence turns attention to those portals of entry in history-taking and in making complete physical examinations. The author calls attention to the absence of data regarding dental infection in many obstetrical histories and examinations. He presents 13 case histories of pre-eclamptic toxemia which came under his observation, cases which were typical, and he dwells especially upon the histories of infection, where obtainable, and the evidence of infection. The data obtained in

these patients point to the fact that it is important to eradicate foci of infection as soon as a case of pregnancy presents, or, if this is not possible, especial care should be exercised in determining the approach of toxemia. Every case should have a thorough dental examination and should be under the care of a dentist throughout pregnancy. The author disregards the belief of the laity and some of the medical profession that any dental procedure at this time is dangerous. He has never seen a case resulting in the disaster of an abortion from this cause, and he has the assurance of many leading dentists that such an occurrence has never come under their observation, although such men would undoubtedly use their judgment in avoiding long, tiring, painful operations. The author concludes that adherence to the infection theory offers the best prospect of success in the prophylaxis of pre-eclamptic toxemia.

Thus it will be seen that while the etiology of the disease is by no means clear or settled, we still have made a marked advance over a few years ago, and are headed in the right direction. What the pathologist has done for us is to furnish the results of the findings postmortem, so arranged as to give us more definite ideas on which to work, and we believe that the time is not far distant when the actual toxin, enzyme or organism which causes the complication, and its method of operation, will be discovered.

Analyzing the situation, then, we are dealing with a woman who in the pre-eclamptic stage is just on the edge of being out of balance, and who, in the convulsive stage, has lost her balance, so that in the first condition we must devote our efforts toward preventing the pathology from getting worse, thus allowing the convulsions to occur, and in the second to preventing them from recurring after they have occurred once, and incidentally only, of relieving the patient of the cause of her complication, namely the pregnancy, this latter, however, to be done without imposing on her a strain which will be greater than the one to which she is already being subjected.

I lay a great deal of stress on the convulsions, because I firmly believe that practically all of these cases die of brain hemorrhage due to rupture of the cerebral blood vessels, and that while it is not universally true that the higher pressure during the convulsion is the causative factor in the rupture of the vessel, it undoubtedly is the main one, as shown by treatment, of which more later.

It is acknowledged that we occasionally see cases which, while otherwise presenting most of the features of the convulsive type, pass away without any actual convulsions, but autopsy reveals the same brain hemorrhages as those present in the patients in whom convulsions did occur. These, however, are more profoundly

toxic than the others and are apt to run a much higher continuous pressure which does not, therefore, affect our premise in the net result.

With these thoughts and facts before us then, let us proceed to take up the final subdivision of our subject, namely, the treatment. This may be divided into

(1) Prophylaxis in the pre-eclamptic state

(2) Treatment of the actual condition when it has occurred. Both of these may be subdivided into (a) medical or conservative, and (b) surgical or radical.

Prophylaxis means watchful waiting. Watchful of small indicative symptoms, always suspicious that the blow is about to fall, yet not rushing into operative procedures too hurriedly, but waiting for a definite indication in short, preparedness, in the most marked sense of the word. Every pregnant woman should be regarded as potentially pre-eclamptic, and that suspicion should not disappear until she has passed through her puerperium. Routine blood pressure, urine examinations and ophthalmoscopic inspections, together with general and special physical examinations should be made at frequent intervals, these to be increased generously if anything occurs which calls attention to any abnormal thing in the economy and it is only by this constant care that results will be obtained. It is often tiresome to physician and patient alike, especially to the latter, who cannot understand the necessity for such proceedings, and it is rarely wise to communicate to the patient the thought which makes us feel the desirability of these frequent visits. Still, the thing must be done, and faithfully, unless we are willing to take the chances of a severe catastrophe, which when in spite of these precautions, occasionally does overtake us, is apt to reflect severely upon our professional judgment and skill, if all means possible for prevention have not been employed.

The diet should be regulated, meat and eggs largely discontinued, fluids given freely, proper exercise ordered and seeing that it is performed, sufficient sleep obtained, and elimination by means of the bowels, bladder and skin secured. The teeth should be inspected and attended to. Printed instructions to patients are never given by the reader, as he prefers to consider each as an individual to be treated especially for the conditions suitable for her alone and not as one of a general class.

In the large majority of cases, if watched and handled in the above manner, no symptoms of toxemia will develop. Occasionally, however, in spite of this care, we shall one day, usually toward the latter part of the pregnancy, note a rise in blood pressure, possibly slight, possibly considerable, the urine may contain a trace of albumin, and an occasional cast and eye changes may occur, slight but distinct.

We now come to the turn in the road. The signs point in two ways, shall we institute medical treatment, and if so, how rigid shall it be, or shall we terminate the pregnancy, and if so, by what means? What shall be the determining factor for the one or the other treatment? The writer confesses that he knows of no positive rule which should be applied in every case and the only thing that can be done is to be guided by one's experience and the judgment based on that experience. If rest in bed, low diet, possibly with an increase in the carbohydrate unit, elimination, etc., do not produce an amelioration of the symptoms or if they rapidly grow worse, termination of the pregnancy should be considered before the patient has reached the point where the eclamptic seizures take place, and this termination, if decided upon after such consideration, should be brought about by some one of the gentler means, in order to avoid the intense shock which otherwise may and usually does occur if the more forcible means are employed. Chloroform should never be used and rough manual dilation is absolutely not to be tried. Cases properly watched and cared for will rarely arrive at this stage, however, and we fortunately shall not often be called on to make the decision.

So much for the prophylaxis. We have seen that by its efficient use, the convulsive cases will be far less numerous than they have heretofore been. Nevertheless, there will always unavoidably remain the uncalculated few who, either from personal indifference or ignorance on their part, neglect on the part of the medical advisor, or a combination of both, or the very small proportion, who, though adequately and conscientiously cared for, still develop convulsions, and who will demand all the resources we can bring to bear to suitably handle their complication.

As already stated at the beginning, the general feeling is still strong that the removal of the uterine contents is the most important step to be taken in the way of relief for the condition, and with the advent of modern surgical technic many operative procedures for this purpose have been employed. Rough manual dilation followed by internal podalic version, with its resultant laceration and marked shock, vaginal hysterotomy, abdominal hysterotomy, have all been exploited and freely tried, and so firmly fixed are these maneuvers in the minds of most obstetricians that until comparatively recently they have been practically universally employed. The reader pleads guilty to having been one of the surgical enthusiasts until within the past five years.

Careful study of the results obtained, both for mother and child, by these operative measures, compels thoughtful reflection, and when we consider that accouchement force gave a maternal mortality of about 30.8 per cent, with

an accompanying fetal mortality of 30.35 per cent, that Cesarean section gives a high percentage of dead mothers with only a slightly improved fetal mortality, it makes one wonder whether or not these means of delivery are after all so efficacious as they would seem.

With this idea in mind, in 1916, the writer made up his mind to at least try out the Rotunda method of treating the actual convulsive cases, giving the method a fair trial, and then to compare the results with the operative method, with the idea of ascertaining if there was not some way in which at least an improvement in the maternal mortality could be made.

Since that time he has had 116 cases in which this method has been definitely followed, 17 mothers have died, or 14.6 per cent. Excluding those who were actually moribund when first seen, 7 in number, and in whom no treatment of any sort would have availed, this leaves a corrected mortality of 8.6 per cent for the net result, with a stillbirth mortality of 22.6 per cent. Certainly a startling difference when compared with the operative method, which showed 30.8 per cent in 250 cases reported by the writer in 1909.

After this time a somewhat modified treatment was instituted which brought the mortality down to 17.4 per cent in 890 cases occurring in 120,000 confinements at the New York Lying-In Hospital up to January 1, 1921. This, however, includes 104 cases of the author's treated in the conservative manner, which reduced the mortality figures considerably.

We now come to the conservative treatment, so called. This procedure was consistently carried out in all cases and, unless the patients gave evidence of prompt delivery when the head reached the pelvic outlet, low forceps were permitted.

It is understood that all of the reported cases were pregnant or recently so, that they all had had one or more convulsions and represented true obstetrical convulsive toxemias.

Immediately on entrance to the hospital the patient's blood pressure is taken, a catheterized specimen of urine secured, and she is put into an isolation room which is darkened, and as much quiet as possible obtained. She is then given by hypodermic injection, one-half gram morphine sulphate, her stomach is washed out, two ounces of castor oil is poured down the tube at the end of the lavage, and she is given a colonic irrigation of five gallons of 5 per cent glucose solution.

If the blood pressure is over 175 systolic, phlebotomy is done, and a sufficient quantity of blood is extracted to bring the pressure down to 150, normal saline is not injected. In the experience of the writer, it is unwise to bleed the patient if the pressure is lower than 175 systolic, as, if for any reason, a good deal of blood is

lost during the delivery, the pressure will be reduced so low that the patient may die from shock. The same objection applies to the antepartum administration of large doses of veratrum viride.

She is now kept quiet and one-fourth grain morphine administered every hour until the respirations drop to eight per minute. At this time convulsions have usually ceased, the patient will have fallen into labor, and, as has happened in practically all of our cases, will be delivered normally or by an easy low forceps in a short time. Occasionally the use of a little ether is necessary to control the convulsions while waiting for the effect of the morphine. The convalescence is treated in the usual manner, as indicated by the symptoms, and has been in our patients significantly uncomplicated.

Summarizing our results, then, we see that

1 The convulsive toxemia of pregnancy is a condition of whose exact cause we are unaware

2 The toxemia is divided into two groups (a) The pre-eclamptic stage, (b) The stage of convulsive seizures

3 We can by careful watchfulness and intelligent supervision, largely prevent the condition from becoming severe, or from occurring at all

4 When it does occur, rough operative procedures do not give as satisfactory results, either for mother or child, as does more conservative medical treatment judiciously combined with the gentler and less traumatic forms of operation

## THE ETIOLOGY AND TREATMENT OF TONSILLAR HEMORRHAGE\*

By GERARD HUTCHISON COX, MD, F.A.C.S.,

GLEN COVE, N. Y.

THE tonsil operation today is performed so frequently in all localities that the dangers connected with it are often overlooked. Not the least of these, both in frequency and severity, is tonsillar hemorrhage, a complication which often leads to a fatal termination. With a proper understanding of this condition and the methods for its prevention and control, this danger may be reduced to a small minimum.

A survey of the literature made by the author in 1912<sup>1</sup> shows a considerable number of fatalities from hemorrhage alone. Nearly fifty years ago, in 1875, Bardeleben<sup>2</sup> reported two fatal cases in which the cause of death was injury to the carotid artery. Downie<sup>3</sup> in 1886 and Casselberry<sup>4</sup> in 1893 each reported a fatality from hemorrhage following tonsillotomy. Damianos and Hermann<sup>5</sup> in 1902 reported the case of a man twenty-three years old, operated in the Vienna Clinic for hypertrophied tonsils, who died sixteen days later from secondary anemia. Autopsy demonstrated an eroded vessel. Digital and instrumental compression, and ligation of the carotid had failed to control the hemorrhage. Johnston<sup>6</sup> mentions the case of a boy seventeen years old, a bleeder, who died from hemorrhage two weeks after the application of a galvanocautery to the tonsil. Hurd<sup>7</sup> in 1910 reported a fatal hemorrhage in a child operated with a tonsillotome. A tonsillar clamp and ligation of the carotid failed to save

the patient's life, death ensuing before transfusion could be performed. Harmon Smith<sup>8</sup> records six additional fatalities, one in a child eight and one-half years of age, who had an anomalous internal carotid artery which was wounded with the tonsillotome. Holinger, Mackellar, and Barkan have each recorded a death from tonsillar hemorrhage and Stucky a bleeder of fifteen years who died from a continuous venous oozing. Chase<sup>9</sup> mentions eight unpublished cases of fatal hemorrhage following tonsillectomy. In reply to Hill's<sup>10</sup> questionnaire, one operator recorded twelve cases of fatal hemorrhage, while another operator reported four fatal cases. One reported three deaths and four, two deaths each.

In 1920 Douglas reported that there had been four fatalities from tonsillectomy in three years at the Post Graduate Hospital.

In 1922 Loeb<sup>11</sup> collected statistics of death following operations on the throat and nose, including only cases not reported elsewhere. Among these deaths were forty-three fatalities from hemorrhage after tonsillectomy. An analysis of the reports of these forty-three cases shows that in sixteen there was lack of post-operative control, while in four cases there was a fatal hemorrhage in spite of thorough ligation of the vessels. In one case the fatal hemorrhage occurred three weeks after the operation. In two cases there was an anomalous branch of the carotid artery, while in still another there was extremely high blood pressure.

\* Read before the Nassau County Medical Society, October 28 1924

Bailey<sup>11</sup> in 1922 sent out a questionnaire and received replies from 350 laryngologists in the United States. Twenty-seven operators each reported a death from tonsillar hemorrhage. In Panse's fatal case (see table) the source of bleeding was apparently blood vessels in an enlarged salivary gland, injured during the tonsil operation. In Macleod's fatal case (see table) the patient died from hemorrhage and shock although the pillars were sutured. In the fatal case autopsied by Sebeleanu (see table) there was a piece torn from the wall of the internal carotid artery. The hemorrhage was so sudden and severe that nothing could be done to stop it and the child died within a few minutes.

Coming now to the cases of alarming tonsillar hemorrhage, the outcome of which was not fatal, we find a report by J. Wright<sup>12</sup> in 1890 of thirty-one serious hemorrhages, and another report by Harmon Smith in 1903 of twenty-four additional cases. In a search of the literature from 1904 to 1912 made by me, thirty-five additional cases were reported. I have recently looked up the literature from 1912 to date and have uncovered thirty-four cases of alarming tonsillar hemorrhage in addition to the fatalities enumerated above. These reports are given in the annexed table.

Thus we find ourselves confronted with a series of 261 cases of alarming tonsillar hemorrhage, with fatal outcome in 125 instances. Such an array of figures may well make us pause and take measures to improve our technic.

### ETIOLOGY

The bleeding in tonsillar hemorrhage comes from the arteries and veins which supply the tonsil. The normal blood supply of the tonsil is given by Coakley<sup>14</sup> as follows:

"The superior pole of the tonsil is supplied from the descending palatine branch of the internal maxillary, and the middle and external portion from the ascending pharyngeal and the ascending palatine arteries, the lower part of the tonsil and part of the lateral pharyngeal wall are supplied from the *dorsalis linguae*."

The return venous supply is composed of a rather large plexus of veins which seem to be assembled partly between the outer layers of the capsule and partly between the capsule and superior constrictor of the pharynx lying just external to the capsule. This plexus drains into the internal maxillary vein above, into the lingual anteriorly and into the palatine below. There is a confluence of veins towards the lower pole of the tonsil. Poynter states that "From this point a large vein leads outward to join the pharyngeal plexus or opens directly into the internal jugular vein." Thus we see that the entire arterial supply of the tonsil comes from the external carotid artery and we also note that the posterior and

lower pole of the tonsillar fossa is the danger zone for tonsillar hemorrhage.

1 Abnormalities in the distribution of the blood vessels supplying the tonsil are often accountable for bleeding.

2 Traumatism, especially injury of the tonsillar pillars and extra tonsillar tissue (particularly the superior constrictor muscle) as well as neglect to tie all bleeding points, is naturally a prolific source of hemorrhage.

3 Acute inflammation of the tonsils is a contraindication to operation until several weeks after the subsidence of the inflammatory process. Moure<sup>13</sup> reports a case of hemorrhage after tonsillotomy during active inflammation of the tonsils.

4 Anemia is a frequent cause of bleeding, and should always be looked for. The writer has noticed that flabby, pale children at the age of puberty are especially apt to bleed profusely.

5 Menstruation and pregnancy are two conditions which especially predispose to post-operative bleeding. Marschik and Otto J. Stein each report cases of alarming hemorrhage occurring in menstruating women.

6 Arteriosclerosis and nephritis naturally predispose to hemorrhage. It must be remembered, in this connection, that the former condition sometimes occurs in young adults. The writer has seen two advanced cases of arteriosclerosis in young adults in the third decade, one in a man and the other in a young woman.

7 Fibroid tonsils, if operated upon, are more likely to be followed by severe hemorrhage than the simple hypertrophied variety. The fibroid tissue interferes with the contraction of the arterioles.

8 Acute infectious diseases sometimes cause tonsillar bleeding if the patient is operated upon just before the onset. F. E. Hopkins reports a case of severe bleeding on the first and second day after operation. The child developed measles on the third day.

9 Syphilis may be a cause of tonsillar bleeding. Operations on people with active syphilis are naturally contra-indicated.

10 Age. Our statistics show that post-operative tonsillar hemorrhage is more frequent in adults than in children.

11 Sex. Alarming bleeding is more common in males than in females. Of thirty-one cases in one series where the sex was mentioned, twenty occurred in males. In Smith's report, among fifty-four cases only eight were women.

12 Sloughing of a vessel wall from a low grade infection not infrequently causes late secondary tonsillar hemorrhage. The writer was recently called to two such cases who had moved to Long Island to recuperate from the tonsil

operation, the bleeding in each taking place seven days after the original operation. Such hemorrhages occur not infrequently two and even three weeks after operation.

13 Hemophilia is a much discussed cause of post-operative tonsillar hemorrhage. One frequently encounters the statement that hemophilia may be ignored provided a careful operation is done and all bleeding points thoroughly ligated. While there is considerable merit in this assertion, yet one who has had a case of hemophilia under his care is usually not disposed to dismiss the subject so lightly.

A case of nose bleed in an eighteen year old hemophile, which I treated in Dr Chappell's service at the Manhattan Eye, Ear and Throat Hospital in 1912, well illustrates the gravity of this unfortunate disease. (Reported by Chappell in the *Transaction of the American Laryngological Association* in 1912.) During the past six years, the patient had repeated attacks of nose bleed every three or four months, principally from the left nostril. After the bleeding had continued for some time, the right nostril also began to bleed. The hemorrhage usually lasted three or four hours.

On February 5, 1912, the boy was admitted to the Manhattan Hospital bleeding profusely from the left nostril. He stated that this bleeding had continued for one month, every second or third day, and that immediately before entering the institution, he had been bleeding continuously for thirty-two hours.

The patient's face was blanched and white as paper. Pulse 120.

Examination of the nose showed a continuous oozing from the whole anterior portion of the septum and from a spot on the anterior end of the inferior turbinate, and from a third spot further back on the floor of the nose. No bleeding vessel could be seen. The left nostril was packed with gauze, saturated with fresh human blood serum. This controlled the bleeding in about fifteen minutes. 20 cc. of the freshly prepared blood serum of the brother was injected into the patient's arm intravenously.

The blood pressure on admission was 110, the haemoglobin 35 per cent and the red blood cells 2,784,000.

The packing, which had been in the nose for almost twenty-four hours, was removed the next day and three hours later the patient began to bleed again, and at 6 p m it was again necessary to pack the nose with gauze. 18 cc of human blood serum was injected intravenously.

For the next four days he was given 18 to 20 cc of fresh rabbit serum twice a day.

The bleeding practically ceased on the fifth day after admission but on the seventh day the patient began to bleed very profusely from the

left nostril, the blood welling out as fast as it could be wiped away and it was necessary to pack the nose with gauze.

Five days later there was profuse bleeding from the whole left side of the septum, which was controlled for a short time by gauze packing, but which recurred again and again until the patient's condition became desperate.

On February 22nd a transfusion operation was performed by Dr George E Brewer, consulting surgeon. The blood was run from the donor's artery into the patient's vein for twenty-eight minutes. The haemoglobin increased from 30 per cent to 65 per cent and marked improvement resulted.

On March 30th, six weeks after admission, he was discharged from the hospital cured.

Although the period at which this patient was treated antedates modern laboratory methods and modern technique for blood transfusion, the case is of considerable interest inasmuch as it illustrates the difficulties with which the treatment of hemophilia is surrounded.

Nowadays, with ordinary care in taking the patient's history, and particularly if the coagulation time and bleeding time are estimated before operation, there should be no difficulty in diagnosing a bleeder beforehand. In this connection it is well to remember, when taking the history, that true hemophilia occurs only in males and is transmitted through the female to the male. Particular attention should be directed to ascertaining the occurrence of umbilical hemorrhage at birth, and hemorrhage from circumcision.

In a personal conversation, Dr F E Sondern told me that in his experience, in the case of bleeders, there are no borderline abnormal cases as far as coagulation time is concerned. For instance, if the normal coagulation time is 6-8 minutes in the Bifi-Brooks platinum loop method which he employs, there are no cases with a coagulation time of say 9 to 10 or 10 to 11 minutes. With bleeders, the clotting time will be prolonged to 16 or 18 minutes, or even longer. In this connection it is well to remember that in true hemophilia the bleeding time is normal, although of course, as stated above, the coagulation time is markedly prolonged.

Fortunately in blood transfusion, we have a means of raising the coagulation time in advance of operation, in addition to transfusion being a most efficacious method of treating post-operative hemorrhage. I am indebted to Dr Rufus E Stetson of New York for notes on cases of tonsillar hemorrhage where he was called in consultation to perform transfusion.

Case 1. Male child seven years of age. Hemorrhage following tonsillectomy. Child in extremis at time of transfusion. 300 cc of whole blood given. Recurrence of hemorrhage two days later easily controlled, second transfusion not

necessary History of bleeding in this case suspicious of true hemophilia

Case 2 Female child between three and four years of age Hemorrhage following tonsillectomy At time of transfusion child was very pale, restless and fretful Rapid pulse Unable to retain nourishment 250 cc of whole blood given Recovery uneventful

Case 3 Male adult about 45 years of age Profuse and uncontrollable hemorrhage occurring a few hours after tonsillectomy Patient's condition at time of transfusion was critical 700 cc of whole blood given Hemorrhage controlled Patient left hospital in two days

Case 4 Male child seven years of age Profuse hemorrhage a few hours following tonsillectomy Child's condition very grave at time of transfusion Almost exsanguinated, unconscious, pulse barely perceptible, air hunger This case was complicated by an acute acidosis, to combat which, the donor was administered large doses of bicarbonate of soda before giving blood 500 cc of whole blood used Recovery uneventful (The four cases are also listed in the table which follows)

Case 5 Male child, five years of age True hemophilic *Pre-operative* transfusion of 500 cc of whole blood given from mother in preparation for tonsillectomy Operation successfully performed without undue bleeding

Dr Stetson writes me that "The use of whole blood intravenously in these cases may be considered as near a specific cure as any therapeutic measure which we can employ Other coagulants such as horse serum, rabbit serum, and thromboplastin often fail to control the hemorrhage, and the delay involved in their trial is often dangerous, and may be fatal to the patient"

#### TREATMENT

What measures may be taken to prevent tonsillar hemorrhage? In the first place the tonsil operation, no matter whether performed under a local or general anaesthetic, is essentially a hospital operation The practice of operating in an office or dispensary and sending the patient home directly afterwards, is, in my opinion, absolutely unjustifiable The heart, lungs, kidneys and arteries should be examined before operation, while in adults the blood pressure should be taken Where the temperature is elevated, the operation is postponed Avoid operating in the presence of, or directly after, acute tonsillitis Do not operate in early pregnancy or during the menstrual period If there is a history of bleeding and a prolonged coagulation time, give a preliminary blood transfusion

Calcium lactate is employed by many surgeons as a routine prophylactic measure for three days preceding operation in doses of 15 grains by mouth tid for adults and grains  $7\frac{1}{2}$  for children

In this connection, a recent article by Bowler and Walters<sup>16</sup> of the Mayo Clinic is of interest These observers have used, in cases of obstructive jaundice requiring operation, pre-operative intravenous injections of calcium chloride daily for three days preceding operation, giving 5 cc of a 10 per cent aqueous solution per dose The results have been gratifying as evidenced by the lowering of the blood coagulation time and the absence of post-operative hemorrhage

I personally believe that a great many so-called post-operative tonsillar hemorrhages are really primary hemorrhages where the bleeding is not thoroughly controlled before the patient is allowed to leave the operating table Too much stress cannot be placed upon the importance of securing a thoroughly dry operative field Use good electric illumination, a good suction apparatus, and a retractor for the tonsillar pillars If the bleeding does not promptly cease when a cotton ball or a sponge holder is held for a moment in the tonsillar fossa, carefully inspect the fossa and pick up the bleeding point or points with artery clamps Ligate with a catgut slip-noose, or transfix with a Seiffert tonsil needle and tie Some surgeons advise their patients to suck ice or gargle with ice-water directly after the tonsil operation I am convinced that these measures are harmful, and tend to increase, rather than inhibit bleeding

There is a tendency among some surgeons in post-operative hemorrhage, to lay too much stress upon general measures for the control of the bleeding The operator will probably order a hypodermic of morphine, an ice-coil to the neck, and perhaps will allow the patient to slowly but steadily bleed, drop by drop, under a clot in the tonsillar fossa In this way valuable time is lost, and the patient loses more and more blood until his condition finally becomes precarious It is far better, if any unusual bleeding takes place after the patient is returned to the ward to inspect carefully the tonsillar fossae under good illumination, boldly wipe away the clot, and immediately take the patient back to the operating room, where the bleeding points may be ligated

Under unfavorable conditions, without sufficient assistance, and where there is need of extreme haste, the Wagner-Michel metal tonsillar clamps are useful aids These resemble the metal skin suture clips, and are sold in special sets with an instrument for introduction and another for removal When using these clips, a small gauze pad is first placed in the tonsillar fossa, and the pillars are brought together and clamped over the pad A small thread is attached to each clamp and fastened with adhesive plaster to the side of the patient's mouth These metal clips should be removed the following morning They have the disadvantage of producing considerable traumatism and tearing of the tonsillar

pillars, and I have discarded them in favor of ligation and suture

In closing, mention should be made of carotid artery ligation as an extreme measure. Either the external carotid may be ligated, or, if there is urgent need of haste, the common carotid may be tied. Jackson ligates the external carotid, and has performed this operation seven times to arrest tonsillar hemorrhage.

Henking<sup>17</sup> in 1905, stated that ligation of the common carotid on account of uncontrollable hemorrhage from tonsillotomy has been practiced by Guntner, Hada Siden, Sands, Fuller, Arbuthnot Lane, Downie and Mosetig-Moorhof.

In the first five cases cited the hemorrhage definitely ceased after ligation, and the patients recovered, although two were apparently hemophiles (Guntner's and Fuller's cases). One of the fatal cases (Mosetig-Moorhof's) died of sepsis sixteen days after the operation. In the other fatal case (Downie's) the cause of death could not be ascertained.

In all of these cases the common carotid was tied, apparently because it is more easily and quickly reached than the external carotid. In none of these seven cases did the ligation of the common carotid have any unfavorable influence upon the brain function.

TABLE OF CASES OF SEVERE TONSILLAR HEMORRHAGE REPORTED 1913 TO JULY 1, 1924

REPORTED BY	Patient's Age	Sex	Disease	Instruments Used	Result	Reference and Remarks	Methods Used for Control of Hemorrhage
O'Malley, J. F.	25	Female		Gullotine	Recovery	Clin. J., 43 49, 1914	No Special Treatment.
O'Malley, J. F.	11	Male	Deafness and Obstruction	Gullotine	Recovery	Clin. J., 43 49, 1914	Hemorrhage beginning 24 hours after operation spontaneously arrested by the time patient reached hospital.
Hurd, Lee M.	27	Male	Recurrent Tonsillitis	Dissection and Snare	Recovery	Laryngoscope 25 856, 1915	Repeated hemorrhages, treated by horse serum, coagulose, pressure, metal clips.
Agnew, F. F.	6	Female	Enlarged Tonsils	Blunt separation of pillars and cold snare	Recovery	Ann. Otol. Rhinol. and Laryngol. 24 44, 1915 The internal carotid was in an abnormal position.	Hemorrhage 2 hrs after operation controlled by application of adrenalin to fossa, compression of carotid artery, and tonsil clamp. Secondary hemorrhage 9 days after operation, was treated by ligation of the common carotid.
Amsden, H. H.	9	Male			Recovery	Boston M. A. S. J., 177 594 1917 Secondary Hemorrhage in a patient operated in another clinic.	Inspection of the tonsil showed a large button-hole of the right anterior pillar from which bleeding occurred, controlled by catgut stitch.
Laboure, J.	22	Male		Ruault forceps	Recovery	Presse Med. 26 396 1918	Hemorrhage after operation controlled by pressure, secondary hemorrhage on 8th day stopped by ligation of the ascending pharyngeal artery.
Laboure, J.	25	Female		Cold Snare	Recovery	Presse Med. 26 396 1918	Hemorrhage immediately after operation, controlled by ligation of external carotid.
Laboure, J.	39	Male	Infected Tonsils	Cold Snare	Recovery	Presse Med. 26 396, 1918	Hemorrhage began after removal of one tonsil not controlled by injections of ergotin, or serum, by pressure or suture of pillars. Ligation of external carotid successful.
Yergen, C. F.	12	Female	Rheumatic Fever	Sluder Method	Recovery	Illinois M. J., 35 142 1919 Hemorrhage apparently caused by erosion of a small vessel.	Secondary hemorrhage on 9th day, severe but ceased spontaneously, a small clot covered the site of bleeding vessel.

REPORTED BY	Patient's Age	Sex	Disease	Instruments Used	Result	Reference and Remarks	Methods Used for Control of Hemorrhage
Dabney, V	18	Female	Recurrent Peri-tonsillar abscess	Mackenzie Tonsillotome	Recovery	Ann Otol, Rhinol and Laryngol 28 697, 1919	Capillary hemorrhage two days after operation controlled by ice held firm'y in the fossa.
Dabney, V	25	Male		Mackenzie Tonsillotome	Recovery	Ann Otol Rhinol and Laryngol 28 697, 1919	Repeated hemorrhage six hours and 10 days after operation, later stopped when the patient fainted Method treatment not stated
Dabney, V (not operated by author)	Adult	Male			Recovery	Ann Otol Rhinol and Laryngol 28 697, 1919	Hemorrhage 7 days after operation finally stopped by clamping the posterior pillar in which the bleeding point was found
Dabney, V	19	Female		Blunt dissection & snare	Recovery	Ann Otol Rhinol and Laryngol 28 697 1919	Hemorrhage six days after operation, controlled by packing fossa with soft gauze sponge
Whales, H L	13	Female		Dissection	Recovery	Brit M J, 1 637, 1919 Hemorrhage probably due to an abnormal tonsillar blood supply	Bleeding during removal of right tonsil Clamping failed, external carotid ligated
Panse, R	17	Male	Enlarged tonsils and cervical glands	Cooper scissors and snare	Fatal	Passows Beitr 12 51, 1919	Tamponade and infusion of salt solution camphor
McKinney, R.	32	Female	Attacks of tonsillitis and kidney infection	Sluder Method	Recovery	Laryngo-scope 30 430, 1920	Hemorrhage four days after operation, ceased without special method of treatment.
McKinney, R	19	Male	Attacks of tonsillitis and nephritis	Sluder Method	Recovery	Laryngo-scope 30 430, 1920	Hemorrhage beginning the fifth day after operation, controlled by suture of the pillars
Macleod, A L	6	Female	Enlarged tonsils and adenoid	Sluder Method	Fatal	Proc. Roy Soc. Med 14 Sect. Laryngol 31, 1921	Hemorrhage two hours after operation, adrenalin dropped in nose, morphin, left tonsillar pillars stitched under second anaesthesia
Sebileau, P (not operated by author)	Child	Male		Morcellation with Ruault forceps	Fatal	Bull et mem Soc. de Chir de Paris 47 109, 1921	Severe hemorrhage during the last part of the operation, pressure did not control it. Wall of internal carotid artery was torn by the operator
Fuller, T E (not operated by author)	8	Male		Beck Instrument	Recovery	Ann Otol, Rhinol. and Laryngol 30 205, 1921	Packing of tonsillar fossa and clamping bleeding vessel
Fuller, T E.	25	Male		Matthews technic	Recovery	Ann. Otol, Rhinol and Laryngol 30 205, 1921	Hemorrhage a few hours after operation controlled by pressure with a sponge
Fuller, T E	23	Female		Matthews technic	Recovery	Ann Otol, Rhinol and Laryngol 30 205, 1921	Hemorrhage 12 hours after operation, pituitrin had no effect Suture of pillars
Fuller, T E	20	Male		Matthews technic	Recovery	Ann. Otol, Rhinol and Laryngol 30 205 1921	Hemorrhage at first controlled by horse serum, recurred, suture of pillars
Fuller, T E	30	Male		Matthews technic	Recovery	Ann Otol, Rhinol and Laryngol 30 205, 1921	Hemorrhage five days after operation controlled by pressure and hypodermic of emetin

REPORTED BY	Patient's	Age	Sex	Disease	Instruments Used	Result	Reference and Remarks	Methods Used for Control of Hemorrhage
Lavton T B	32		Male		Dissection	Fatal	J Laryngol 36 177, 1921	Oozing after operation necessitated suture of pillars recurrence treated by pressure, painting fossa with turpentine, clamping morphin and saline infusion
Just, T H (operated by Harmer)	Child		Female	Enlarged tonsils and adenoids	Tonsil lotine	Gul- Fatal	Brit M J 2 431, 1921 (abnormal loop of internal carotid artery severed)	Pressure.
Hawkins, A D	23		Female	Submerged necrotic tonsils	Not Stated	Recovery	Journal Lancet, 42 449, 1922 (day after operation patient developed mumps)	Oozing of blood began immediately after operation, pressure clamping, suture of pillars failed to control, 5 cc of a hemostatic serum preparation given subcutaneously with good results
Martin C E	16		Female		Scissors and snare	Recovery	J Laryngol 37 80, 1922 Second tonsil was not removed	Hemorrhage occurred at operation after dissection of right tonsil Bleeding points caught with artery forceps, clamp applied
Ramey, J J	43		Male		Scissors and snare	Recovery	Laryngo-scope 33 446, 1923	Ligation of vessel in the left tonsillar fossa, vessel in right fossa ligated at operation.
Ramey, J J	14		Male	Tonsillitis and rheumatic fever	Scissors and snare	Recovery	Laryngo-scope 33 446, 1923 Hemorrhage from vessels in lower pole. Those in upper pole ligated at operation	Pressure three or four minutes with sponge dipped in adrenalin.
Callison J G	19		Male	Enlarged tonsils, rheumatism		Recovery	Laryngo-scope 34 354 1924 Coagulation and bleeding time normal, but platelet count low	Recurrent bleeding for 11 days after operation Transfusion, sodium citrate injections and a preparation of thyroid pituitary-spermin extract used
Stetson R. E	7		Male	Tonsile case			Personal communication from Dr Stetson	History of bleeding suspicious of hemophilia Transfusion with 300 cc of whole blood
Stetson, R. E	3		Female	Tonsile case			Personal communication from Dr Stetson.	At time of transfusion child was pale, restless, and unable to retain nourishment. 250 cc. of whole blood given
Stetson R. E	45		Male	Tonsile case		Recovery	Personal communication from Dr Stetson Oct, 1924	Uncontrollable hemorrhage a few hours after operation Patient in critical condition 700 cc. of whole blood given. Discharged from hospital in 2 days

Reported by	Patient's Age	Sex	Disease	Instruments Used	Result	Reference and Remarks	Methods Used for Control of Hem
Stetson, R E	4	Male	Tonsile case		Recovery	Personal communication from Dr Stetson Oct, 1924	Profuse hemorrhage a few hours after operation. Patient unconscious and almost exsanguinated, air hunger This case was complicated by an acute acidosis, to combat which the donor was administered large doses of soda bicarbonate before 500 cc of whole blood was given Uneventful recovery

### CONCLUSIONS

1 The most frequent causes of tonsillar hemorrhage are traumatism at operation, and neglect to secure a dry field by ligating all bleeding points

2 The majority of tonsillar hemorrhages are operative and not post-operative

3 Hemophilia, while rare as a cause of tonsillar hemorrhage, presents serious difficulties in treatment Early transfusion is the only efficient means of control In pre-operative tonsil cases with prolonged coagulation time, the latter should be brought to normal by transfusion before operation

4 Late secondary hemorrhage is usually due to infection

5 The treatment of tonsillar hemorrhage is surgical—the ligation of all bleeding points in a dry, clean, well illuminated field

## A SIMPLE AUSCULTATORY METHOD OF PHYSICAL DIAGNOSIS

By R BURTON-OPITZ, M D,

NEW YORK CITY

AS a rule the heart and other organs of the body are outlined by the method of percussion, as first practiced by the Austrian physician, Auerbruger, in 1761 This method has been greatly amplified since then and now includes several procedures, namely

(a) Direct percussion with the index or middle finger of one hand, and

(b) Indirect percussion, when the index or middle finger of the left hand is interposed between the part to be mapped out and the percussing finger of the right hand The place of the amplifying finger may be taken by a plate of rubber (pleximeter of Piorry), and the percussing finger by a small hammer made of the same material (Barry)

These methods of percussion may also be combined with that of auscultation A stethophone

is placed over the organ to be mapped out while the neighboring regions are lightly tapped upon with the finger or hammer of the pleximeter

I should like to call attention to a simple method of auscultatory stroking which has given excellent results as proven by means of the fluoroscope and Roentgen photographs While I have used this procedure principally in mapping out the heart, it may be applied with equal accuracy to other organs, such as the liver and kidneys

The bell of the stethophone is placed over the sternum at the second interspace By means of a blunt colored pencil short vertical strokes are then made from without inward, beginning about three inches to the right of the sternum As the pencil is moved inward a line will eventually be reached when the sound suddenly increases in its intensity This point is marked with the pencil The stethophone is then lowered about an inch

each time and this process repeated, until the entire right border of the heart has been charted in this manner

The stethophone is now raised to its former level at the second intercostal space, while stroking movements are made with the pencil beginning at a point three inches to the left of the sternum. The point at which a sudden increase in the intensity of the sound is noted, is again marked. The stethophone is then moved downward and this process repeated. At about the fourth rib the stethophone is shifted towards the left so that it comes to lie over the main mass of the ventricles. Sweeping oblique strokes are then made, beginning about four inches above the bell of the stethophone. This process is repeated in successive radial lines until the entire left border of the heart has been outlined.

The lower border of the heart is ascertained by placing the stethophone over the ventricles

two inches to the left of the sternum, and by making short horizontal strokes from below upward, beginning at a point about three inches below the bell.

The accuracy of this method may be tested in the following manner. A paste made of mucilage and barium sulphate is applied with a camel's hair brush in such a way that the different colored marks are joined with one another in the form of a line about three millimeters in width. The patient is then fluoroscoped. If the outlining has been correctly done the barium line cannot be differentiated from the dark borders of the heart. Furthermore, if the patient moves the tip of his index finger along the barium line, it can readily be noted whether this line corresponds with the fluoroscopic findings. Additional proof of the accuracy of this method has been obtained by the taking of numerous X-ray plates showing the barium line superimposed upon the boundary of the heart shadow.

## A CASE OF INFECTIOUS JAUNDICE\*

By E S McDOWELL, M D,

PLATTSBURG N Y

**I**NFECTIOUS jaundice is a common disease in Japan. It is caused by spirochetes which are often found in rats, although the animals do not seem to be particularly affected by the organisms. The spirochetes reach man by means of food infected by the excretions of rats.

Many outbreaks of infectious jaundice have been reported in widely separated parts of New York State, and many attempts have been made to discover and isolate the organism in the patients, but the cases have been mild and the onset of the disease insidious, and the organisms have disappeared by the time that the nature of the illness is suspected. No fatal cases have previously been reported in New York State. The following case is therefore of interest because the typical history was confirmed at autopsy and the spirochetes were identified in the tissues.

The patient was a man aged 43, working and sleeping in a kitchen that was infested with rats, but he gave no history of a rat bite. He suddenly became sick about July 1, 1924 with fever 103, and severe pains in his joints, back, and abdomen. After three days he had a total anuria which was followed within 24 hours by a cardiac collapse, his pulse running from 140-160, and being totally irregular in rate and rhythm with frequent extra systoles. He soon became very deeply jaundiced. Following this he vomited bloody material and passed blood by rectum. He de-

veloped a persistent hiccough and died in a convulsion about one week after the onset of the disease.

The urine obtained by catheterization, which was only one dram in amount, showed red and white cells, bile, hyaline and epithelial casts, and 3 plus albumin. His Wasserman was negative.

Autopsy showed a deeply jaundiced man. The autopsy findings showed no evidence of liver atrophy, the kidneys were large and swollen, and there was evidence of petchial hemorrhages through the gastro-intestinal tract. The microscopic examination of autopsy material showed acute glomerular nephritis, and extensive destruction of liver cells, and the spirochetes were demonstrated in the liver and kidneys. There was intense hemorrhagic congestion of the lungs.

One rat from the premises was obtained alive, and its blood was inoculated in guinea pigs. The guinea pigs developed all the symptoms of Weil's disease and the spirochetes were obtained from their blood stream, re injected, and the disease reproduced, and the spirochetes reobtained.

Infectious jaundice is likely to occur in the practice of any physician, and may assume a virulent type. It is a disease to be considered when an attack of stomach ache and backache is followed by jaundice.

The common occurrence of the disease is a strong argument for the eradication of rats and for the proper control of garbage heaps, which are their great breeding places.

\* Abstract of a paper read before the Medical Society of the County of Clinton in Plattsburg on November 18 1924

## THE JOURNAL DURING 1924

We have often been asked what we were doing with the JOURNAL. We were unable to tell with any degree of accuracy, and so we have patiently compiled a statistical array of figures regarding the material which we have published. Our philosophically inclined readers who may be interested in the ideals which actuated us at the beginning of the year, will find a statement of our aspirations on page 24 of the January issue. Then on page 999 of the December issue they will find a statement of our policies after they had undergone a year's evolution and crystallization.

Last year's JOURNAL is numbered Volume 24, which indicates that the JOURNAL has been published during twenty-four years. Twenty-one

numbers were issued in 1924. One number was issued each month, except from February 1st to April 18th, inclusive, when the JOURNAL was issued weekly. The work of the editorial staff during the weekly issues was like that on a daily paper. The work had to be done quickly, and the editor often had to play the part of Procrustes as he either stretched or amputated the articles to fit the space that was available for them.

We printed 1,034 pages of text during the year, as compared with 514 pages during 1923, and 594 during 1922. Scientific articles occupied 409 pages, or about 40 per cent of the space. The number of articles was 102, covering nearly every phase of medicine. The amount

of space given to medical papers was governed by the number and length of the papers which are read at the annual meeting, but in addition we have been able to publish a few others which had a special timeliness

We have run 83 pages of editorial matter, on 87 topics. The subjects have been predominantly educational

Mr George W Whiteside, our Counsel, has contributed 42 pages, consisting of 29 reports of lawsuits against physicians, and thirteen educational articles upon the legal aspects of the work of medical societies and practising physicians. Mr Whiteside's department is an excellent storehouse of legal lore for the practising physician

Dr James N Vander Veer, the chairman of the legislative committee, contributed 165 pages to the Legislative Department of the JOURNAL last year. This exceeds the amount of space used by any other contributor, including the editor. When we consider that Dr Vander Veer wrote or edited this as a by-product of his legislative experience, we admire his earnestness, sincerity, and spirit of self-sacrifice, and wonder how he got time to practice medicine at all

Medical Surveys of nine sections of New York State have filled 26 pages. These are the first attempts that have been made to list the public activities of physicians in distinction to their individualistic work of treating cases of sickness. While the primary object of the surveys was to secure information for the benefit of the State Medical Society, an effect of still greater value has been to stimulate local interest in all forms of the practice of civic medicine

Studies of the medical items that have appeared in the daily press have filled 37 pages of last year's JOURNAL. It is gratifying to note the friendliness of the editors toward physicians and preventive medicine, and the high medical standard of the items. Our study confirms our opinion that the daily press is of great importance in the medical education of the people

The New York State Department of Health has used 22 pages of the JOURNAL and has filled

them with announcements of its policies and news of public health developments

Items of Medical News have been given a prominent place in every issue. We have made a special effort to obtain full reports of the meetings of the County Medical Societies, and to print them in a form which would be both interesting and instructive. The sixty County Medical Societies in New York State (Dutchess and Putnam are united in one Society), hold 172 meetings annually. We have printed 58 reports of the meetings of 27 County Societies. Albany County has sent seven reports, and Bronx County five, Richmond, Rockland, Tompkins and Washington have each supplied four reports, and Livingston three. We have received two reports from Cattaraugus, Columbia, Nassau, Queens, Saratoga, Suffolk, and Wayne, and one from Cayuga, Clinton, Delaware, Essex, Greene, Jefferson, Kings, Oneida, Ontario, Oswego, Otsego, Schoharie, and Schuyler

The percentage of meetings reported last year was thirty-three. Let's double it this year

Book reviews occupied 35 pages last year, and 148 medical books were reviewed. The reviews have been prepared with great care by competent specialists whose names are signed to their articles. The news about new books is as important as items concerning any other phase of medical activity

A page of Prunes appeared in 17 issues of the JOURNAL last year. It is always difficult to get the unbiased opinion of sedate medical men regarding this department of the JOURNAL. We passed out advance copies of the December issue to the twenty-two members assembled at a meeting of the Council. Nineteen members opened the JOURNAL at the back and hesitated at the beginning of the index, and ten of them inquired where the Prunes were. We will continue the department this year

Our prognostications went astray in one respect. We had expected that the physicians would demand considerable space for correspondence, but very few letters were received for publication. Controversies carried on in a monthly journal are too much like a slow game of chess to suit this active age.

F O

## ORGANIZATION

A State Society, especially of medical men, succeeds in its endeavors only as the thoughts and principles of proper type are instigated and carried through by a well organized body, and the effort of that body can succeed only to that extent where these thoughts and principles are put into active practice

The standing of a body of citizens in any profession is considered in general conversation or debate only by reason of accomplishments slowly but surely gained through concerted effort and through the prestige of individuals in that body being given over to the advancement of the body as a whole

The Medical Society of the State of New York has ever stood for that which is right toward the people of the State from a broad viewpoint of the questions under consideration. Its plans and its principles have been inclusive of all scientific discoveries when they have been proven of value

It has seldom erred in narrow or limited ways for the advancement of the group of physicians which compose it, or of those members of the profession who have not seen fit to enter into its membership

It has constantly striven to develop its younger members along the lines of scientific research and desire for more knowledge in the alleviation of individual and public ills of medical nature

It has slowly though surely taken these newer ideas unto itself and adopted them wholeheartedly, when proven of worth

At times it has been threatened by dissensions within its ranks concerning new thoughts in the questions of the diagnosis and treatment of old and new diseases, or matters political within its own ranks, but with the broadminded attitude that physicians should have in relation to each other and to the questions at issue, it has thrashed out these differences to the betterment of the Society as a whole

It is the duty of your officers to see that all questions of import pertaining to the individual in the Society are thoroughly discussed within the ranks of the Society before decisions are arrived at

Too often the criticism has been that the individual County Society or the Council of the State Society has acted hastily on matters without allowing freedom of discussion, but in contravention it may be said that too often a small group tends toward endless discussion for the purpose of delaying a decision on a question which in some cases must needs be met promptly

With this in mind your Society has created the position of Executive Officer, and among others of his duties it is delegated to him to disseminate by word of mouth the ideas originating from individuals or groups who have the welfare of the Society at heart

It is to be hoped that through his efforts, questions which may recur or new ones which may appear can be the more thoroughly discussed with advantage to all of the members of the Society and decisions arrived at more quickly than in the past

J N V V

---

## KEEP THE OLD SECRETARY

In these days of business efficiency, no concern would think of hiring a secretary and then, just as soon as he learned his job, let him go. That, however, is just what a great many of the County Societies do

If you have a good secretary, why not keep him? There are a good many reasons for this. The job of Secretary is different from the presidency of the Society, which should change every year. The secretary must know the doctors of the County and what their opinions on various subjects are, and what they are willing to do for the Society. He must also have a working knowledge of the doctors' likes and dislikes, so that the best results may be accomplished in the appointment of committees and assignment of work. He is the custodian of the books and records of the Society. In some counties these are becoming of much value from an historic standpoint. He is the "whole works" of the County Society between meetings. He keeps the

bearings greased and makes the machine run smoothly. He does all the work and gets little thanks for it. Why change just when he is learning his job? That is not good business. It does not make for efficiency. It is wasteful. There is no good reason for getting rid of a good secretary, except death.

He should be paid. That doesn't mean that the salary should be large enough to make a prize of the position, but a small honorarium most certainly ought to be given. No one likes to work for nothing. Many times work like professional services done for nothing is worth just that much. Why not pay the secretary a reasonable salary?

Pick out a man who is interested in the work and who has a bent for writing and one who knows the doctors and can work with them and for them and make him secretary of the County Society, and then be business-like enough to keep him on the job

W L M

## COUNTY MEDICAL SOCIETY MEETINGS

During the month of December, twenty-seven County Medical Societies held their annual meetings. It was our privilege to attend seven of these, namely

December 2nd, Herkimer Co at Herkimer  
December 9th, Otsego Co at Oneonta  
December 9th, Ulster Co at Kingston  
December 10th, Montgomery Co at Amsterdam  
December 16th, Nassau Co at Hempstead  
December 18th, Monroe Co at Rochester  
December 19th, Cortland Co at Cortland

We should have attended more had it not been that so many of them met on the same days, for instance, on the second Tuesday eleven of the twenty-seven held their meetings, and the other sixteen were divided among eight different days. It is our aim to meet at least once with every County Society as early as we can, in order that we may learn how the State Society, through its office, can best serve the component County Societies. We are convinced that there are no more powerful medical units than the County Societies of the State of New York, and as they develop their possibilities and assume their responsibilities, mutually cooperating with one another, they will strengthen the State Society and thereby secure for it the position it deserves in the medical world. Its membership, through its sixty component County Societies, has passed the ten thousand mark, indicating that more than

two-thirds of the physicians of the State are enrolled in the organization. As each County Society realizes that it is the only legalized medical organization in the County, and makes it a part of its business to keep in touch—either directly through its *Comitia Minora* or through its special committees,—with every medical activity undertaken or inaugurated in the County, will its local influence develop. For a Society to function effectively, it is quite essential that it should have frequent meetings in order that proper consideration may be given to the medical needs of the community, as well as to the medical activities that may arise outside of the Society.

At another time we will take occasion to discuss the wisdom of having frequent meetings of the County Societies, but in the meantime it might be worth our while to know that two Societies in the State have but one regular meeting a year, thirty per cent of the Societies have two meetings a year, thirty-three per cent have four meetings a year, and only twenty per cent have six or more meetings annually.

Since it was impossible for us to attend the meetings held by those two Societies which meet but once a year, it will be necessary for us to wait another year before we can meet the physicians of those Counties and discuss the active program which the State Society is undertaking.

J S L

## STATE MEDICAL LIBRARY

The larger County Medical Societies conduct more or less extensive libraries. Kings County is the proud possessor of a library that ranks with the leading medical libraries of the United States. The two main influences upon which the practitioner, as well as the research worker, depend for assistance and stimulation, are the libraries and clinics. The clinics are difficult to move from the larger hospitals, and yet very successful clinics of a specialized type have at times been conducted in remote parts of the State.

An opportunity for extending library facilities to every section of the State is afforded by the medical library which is a part of the general library located in the Education Building in Albany. On its shelves will be found more than five hundred journals, purely medical in character published by societies from all parts of the world. In other divisions of the library will be found more than an equal number of journals on allied subjects. In its alcoves will be found the latest books on every medical subject. Great pains are taken by the authorities to make the library as useful to the physician

as possible. In this connection it should be more generally known that all books and journals are available to any physician in the State, and can be secured by simply making application to the State Medical Library. If a physician is writing a paper or wishes to inform himself more extensively on any particular subject, the librarian will assist him by either preparing for him a list of the latest books that have been written upon the subject and the most recent articles, or, if he has the references, sending him for his own study the books and journals in which they appear. For this service there is no cost to the physician except to pay postage when returning books and journals. They may be retained for four weeks, longer if requested.

This information should be particularly valuable to the Secretaries of County Societies when they are endeavoring to persuade local men to prepare papers for their meeting. With the assistance of the librarian any physician, no matter where he is located in the State, can, in the course of a month or six weeks, familiarize himself with the latest opinions on any subject that he may select.

# LEGAL

By GEORGE W. WHITESIDE, Esq  
Counsel, Medical Society of the State of New York

## MEDICAL TESTIMONY

Hon Mitchell May, Justice of the Supreme Court, recently delivered a charge to the jury in a malpractice case tried by counsel which is a model for clarity, fairness and learning. The plaintiff in the case was a child of eleven years who had fractured his femur and was suing, through his guardian, the physician who attended him, claiming that an X-ray had not been taken early enough in the treatment to discover an overriding of the fragments, with the result that an open operation was made necessary to break up the callus that had formed and to reduce the fracture.

A child-plaintiff makes a strong appeal to a jury, who are often influenced by their sympathy for his suffering or deformity. In treating this phase of the case Judge May, in the charge, said:

"You have, also, an unusual situation, because there is an appeal to you, an appeal to the human qualities that you possess, that tugs on the one side and pulls on the other, for we have before us, by way of a strange coincidence, a boy who was injured just one year ago today, who today suffers from the consequences of the injury that he then sustained and who will continue to suffer some inconvenience for a considerable period of time, his knee joint having stiffened as a result, no matter by what means, or methods, as a result of this accident. We know that he suffered pain, that he suffers added pain and our hearts go out to every boy, for most of us are fathers and we understand the position that the boy is in. We feel for him keenly and we wish him well. Could this whole thing have been undone, it would have been undone, but that is neither here nor there. We are to deal with that phase of the case just as it is, recognizing that our sympathies may play no part.

"And on the other hand we have the tug, the recognition that there is at stake a doctor's reputation, to a large extent, for care and for skill and we know that he is a young man starting out today full of enthusiasm, who has given of his service to his country, who has done, perhaps, from his standpoint, the best that he thought he could do. He is now under attack. And that should play no part in this case, for we are not concerned with the consequences or the results of this case. We are concerned in seeing that justice is meted out, and if the fault lies at the door of the doctor through some carelessness on his part for which he is now accountable, then he may not complain, because it is his own fault, and if the proof is not of sufficient quality to justify a jury in drawing its conclusions that that responsibility lies at his door, the jury may not place upon him a burden which is not rightfully his."

In this way the Judge balanced the sympathetic features on each side, so as practically to eliminate them from the case.

Speaking of the medical testimony, of which there was considerable, as eight doctors had testified in the case, the Judge continued:

"You and I know, and it has been frequently said, that medicine is not an exact science. Medicine is far from being an exact science, because there are so many instrumentalities at work, so many influences that are brought to bear, that there is no certainty about the result of anything that we may suffer from—whether from the ordinary diseases or whether from these injuries that sometimes result in deformity. And no doctor is called upon as a guarantor, or an insurer, that he will produce the very best results, that he is going to produce a perfect boy, a perfect union, a perfect result. Those things are not within contemplation, nor does anybody expect that. We all know that from our experience, the uncertainties of life, the uncertainties of the treatment of diseases and the ailments from which we suffer, and we simply ask, as we have the right to expect from a physician, that he possess the ordinary qualifications of a physician to treat the kind of sickness that he undertakes to treat, as is recognized by the people in his neighborhood, as is performed and done by physicians of his standing in his neighborhood.

"We do not expect of the physician, the ordinary physician, that he have the qualities of the great expert. One man selects a great expert, a man of unusual standing, he recognizes that that man may command a big figure for his services, that man has been singled out, and if all men were put upon the same plane, subjected to the same criticism for his work, as would be the man of superior talent, or the man of recognized superior ability and be chargeable for failing to do those things which a man of superior ability does, then no physician would undertake to do his work. If he had to guarantee his work, no physician would undertake his work, because it would be too hazardous and the chance of law suits would be ever imminent, ever present."

Judge May said, concerning the issue as to the taking of the X-ray in the case:

"The main complaint in this case, however, is not with the instrumentalities that he used but with the failure on his part to have an X-ray plate taken within a reasonable time after the injury. Around that hinges practically the whole of this case and it is in the light of that that you may make close study for the purpose of determining what the defendant did or whether he failed or what he failed to do, for the facts themselves are not in dispute.

"The accident happened on December 9th. And then on December 30th, eighteen days thereafter, this X-ray picture was taken, and this X-ray picture disclosed that there was an overriding, or overlapping, and it may become an important thing for you, in the determination of this case, to arrive at a conclusion as to the amount of the overlapping or the overriding. The theory of the plaintiff's case is this: That the X-ray is an instrumentality in ordinary common use. Doctors use it to aid their diagnosis. Doctors use it in fractures, for the purpose of determining the manner in which the bones lay, for, after a bone is set in plaster cast—and that is done for the purpose of immobilizing bones, for the

purpose of preventing them from moving—the bones start to set, because as soon as a fracture occurs, there is exuded from the bone, certain material, we will call it cement, we will call it callus, it is a liquid that is sent out by nature for the purpose of re-uniting, by way of cement, by way of bony substance, in time, these fragments that were split apart. And by taking an X-ray within a reasonable time after an injury, it is claimed by the plaintiff that there could have been discovered this condition of overlapping and that means could have been adopted at that time to have overcome the result of that overlapping, that overriding, and that by failure on the part of the defendant within a reasonable time, to have this X-ray taken, this leg started to unite in this condition, so that there was overlapping, overriding, and plaintiff claims that there would have been a resultant deformity which would have lasted through life and that resultant deformity could only be corrected by the method which has been spoken of as the open operation, and that that operation would have become unnecessary and that that deformity would not have existed if the defendant had, by the use of an X-ray, ascertained in time, before these bones started to unite, the condition of overriding and have used such methods as would be found necessary to have overcome the effect of it."

On this branch of the case the court charge gave consideration to the conditions facing the doctor, as follows

"He had no X-ray machine, nor is he chargeable with negligence for not having an X-ray machine, nor did he hold himself out to the world as being the possessor of an X-ray machine. We have proof here as to the X-ray machines that are in the neighborhood. What is the defendant called upon to do? To use, firstly, his best judgment, and if he makes an error of judgment, he is not held accountable. You and I know, as we drive along the highways in our automobiles, it may come to an emergency where we have the right to choose one of two or three directions to go. We use our best judgment and ultimately it may prove fatal or serious. We are not chargeable with that. No man is chargeable, if he uses his best judgment, unless before that time he has committed some negligent act which calls upon him to use judgment. Then his judgment is not excused, if the negligent act is the primary basis for the use of the judgment.

"And here the defendant is not chargeable if he made an error of judgment, so long as he used his best judgment, so long as he possessed the skill that he said he possessed as I have charged it to you, so long as he applied that skill in an ordinary skillful manner. \* \* \* When he has done that he has observed every responsibility. Whereas, if he has failed to do that, he is chargeable with negligence and with all the results that flow from his negligence. \* \* \* You must have in mind the situation that prevailed, you must have in mind the question whether the defendant used his judgment in not transporting the boy to a hospital under the conditions that he said as to the dangers that were present in transporting the boy, about the cost of bringing the machine there, whether he used reasonable judgment, whether he acted fairly, as a conscientious man, an ordinary, skillful man would have done under the circumstances."

Speaking of the proof offered by the expert witnesses, Judge May said

"And then we have the expert proof. And here we are going into a field with which you, gentlemen, are unfamiliar. We are treading on soil that is strange to you, talking about matters with which you have no ordinary concern. Yet, you have listened, and what concerned you most, is the application of the same tests to these expert gentlemen as you give to every other witness, the same application. You are to be influenced by your judgment of their knowledge, of their accuracy, of their honesty, of their fairness, and of their frankness. Those are the tests. You apply those tests to these men. \* \* \*

"You have heard, on the one hand, that this buckling overriding, of whatever the amount was in this case, was a deformity. You have heard, on the other hand, that that deformity would remain during life, that it could be cured, or corrected, or relieved by a sole, an extended sole, upon the shoe. That is what you have heard.

"You have heard, on the other hand, that nature would have taken care of that in due course of time. One physician said between two and five years that deformity could have been overcome and others say that by the time he arrived at twenty-one years of age, it would have been corrected, because nature would have attempted to correct it, to cure it, to compensate for it, and that the bones, the part of the bone where it had its growth was still intact and that though there was a shortening as a result of this overriding, that bone would grow longer, relatively speaking, than the other, so they both would be the same length from end to end by the time the boy became twenty-one years of age.

"And we have heard the testimony that this condition, as it was left by the defendant, was a good condition and we have heard by other physicians that this condition, as left by the defendant, was not a good condition. \* \* \* There is a dispute as to whether that open operation was, under the circumstances, the best thing to be done. An open operation is a dangerous operation. It has been testified to here that very few men will undertake such an operation upon children, that there is danger of infection, and they say that infection did develop here and that infection has disappeared. But there is no telling, when an operation of that kind is undertaken, what the ultimate results will be. \* \* \*

This case ran through four days of trial, some sessions lasting until late into the night. There was a mass of lay and expert testimony on both sides of the case. Yet from this maze Judge May delicately eliminated the sympathy on either side, fixed the jury's attention clearly on the salient issues, brought out in bold relief the conflicting contentions of the parties, guided the jury's judgment in weighing the expert testimony, and reduced the case to a simple issue—all with flawless precision of choice English and without any legal error, and without exception being taken to any statement made in the charge by counsel on either side. It was a masterly charge, delivered without the use of notes and evidenced a high judicial wisdom and scholarly understanding. The jury returned a verdict in favor of the doctor.

# LEGISLATION

By JAMES N. VANDER VEER, M.D.  
Chairman, Committee on Legislation

## RECOMMENDATIONS FOR 1925

The business of the Committee on Legislation, as laid down by your organized body represented in the Society, has commenced. From now on questions of import will be presented to the society and the practitioner of this State through the Journal and through the discussion within the various medical groups.

It is to be hoped that the Legislative Chairmen of the individual County Society Legislative Committees will function to the utmost and even to a greater percentage than has heretofore been seen in the dissemination of such information as may be gathered and sent in to your Legislative Bureau for the purpose of classification and reissuing to the Society as a whole.

During the next few months your Committee on Legislation earnestly asks each individual member of the State Society or others who are not as yet members and into whose hands the Journal may come, for press clippings, articles delivered before lay bodies which in any way touch upon public health or the relation of the medical profession to the body politic, bits of information relative to the various angles that come up within the profession or lay groups politically, civil, or of legislative import.

Your Committee on Legislation cannot urge too strongly that the newer or recently elected Chairmen of the individual County Society Legislative Committees immediately get in personal touch with their individual legislators before whom will come the important questions as the session advances.

It is to be recognized that the Chairmen who have served in years past have already taken up the duties which they owe to their County and to their State, as individual citizens and equally as well premised to be those educated in matters of public health, to once more discuss freely and frankly and without bias questions that are likely to come up with their representatives.

With each recurrent Legislature there are naturally two groups which must be brought into the open—made acquainted with each other and which must show to each other their real interest in the work assigned them. The first group is composed of the Chairmen of the individual County Society Legislative Committees newly elected and who never before have had to do with legislative work and who therefore are in a measure unacquainted with the fairness and frankness which must be shown in legislation in this State.

The second group is composed of those newly elected legislators who never before have sat within the legislative bodies. It is with these men that the County Legislative Chairman—be he old or new—has much to do in behalf of the safety of the public health of this State.

In some Counties perhaps there may be a third grouping in that we find newly elected Chairmen and newly elected legislators, both of whom are unfamiliar with procedures and methods of lawmaking bodies.

Frankness of discussion and the furnishing of information that is incontrovertible in the eyes of a fair minded man, are the duties in the main of the County Legislative Chairmen from now on for some months to come.

It is to be recognized that New York State stands foremost among all the States of the Union in the matter of its scientific work of whatever nature, and that the medical profession of this State stands at the head of the list in comparison with all the other States of the Union.

It is recognized throughout the world that the State of New York stands first on the list in the matter of education and that the State Department of Education is looked up to and patterned after by the various States of the Union.

It is beyond cavil among the lay people who know the public health worker and the medical profession of the world, that our State Department of Health has no equal.

These standards have been brought about by none other than those who, year after year, have sat in our legislative halls and patiently have listened to the arguments which have raised the State to its present high position, and by their efforts have placed the State in its present high standing.

It may also be said that just as patiently have they listened to the arguments of those who would break down the standards which it has taken so long to establish and with equal clear vision have voted against such questions as would undermine the standing of the Empire State in the eyes of the world.

It is to be hoped that whatever this legislative session brings forth, no backward steps will have been taken to jeopardize the health of the people of the State, and that when the session comes to a close the medical profession may feel grateful to the people and to the legislators for

a maintenance of the high standards, and that the legislators can depart for their various homes satisfied in their innermost hearts by the knowledge that they have contributed to keeping New York State at its high pinnacle as demanded by the true sciences of the present day, exhibited through the efforts of the individual citizen

Your Legislative Bureau would recommend to the Presidents and Chairmen of the Legislative Committee that they endeavor to have their County Societies appropriate sufficient funds to pay for subscriptions to the following journals, that these two officers, at least, may be kept posted up to the minute on matters medical in the State and in the Nation

- 1 Journal of the American Medical Association,
- 2 Hygeia,
- 3 American Medical Association Bulletin

All of these are published by the American Medical Association, and can be obtained from their headquarters at 535 North Dearborn Street, Chicago, Ill

These periodicals are invaluable to those members of the medical profession who desire to keep posted on the medical views of the day of the other States and of the nation

Your Legislative Bureau would be pleased to receive the names of local publications put out by the various Societies, large or small, in order that it might subscribe to the same and thus be kept posted from the standpoint of the local or community thought

Your Legislative Bureau is ever ready to advise with individuals or County Societies or their officers, through the Committee on Legislation or the Executive Officer, during the legislative session, concerning questions which lie within their jurisdiction, and it is to be hoped that the individual County Societies and the individual members of the State Society will learn to use the Bureau more and more on matters of this sort as time progresses and the Bureau is developed

If a thing in this world is good, it should be used, and in proportion as its use increases, so in a greater proportion does its worth and value increase

Once more your Committee on Legislation addresses itself to the Chairmen of the individual County Society Legislative Committees, as the law-making branches of the people of the State come together in annual session

Questions of moment from now on will develop slowly or very quickly, as the minds of the legislators are directed toward the problems of the State

Among them quite naturally will be many questions of public health, or those which deal with the medical profession in its relation to the people of the State individually or as a whole, and the profession again must put itself squarely before the people, and especially before their representatives in the State legislature, that they are not the avaricious group upon whom are heaped all of the abuse by the unthinking, who only see a possible immediate benefit for their own personal interest

Many a physician cannot sense for a time the why and wherefore of the action of the Medical Society as a whole because he is not in touch with the situations throughout the State and because in many instances he has not the initiative to study such problems the same as he would attack a question of diagnosis in a patient where the symptoms at first were obscure but gradually cleared themselves as time went on

Just so is it with the legislators, who are in the main anxious and willing to do that which is the best for their own local constituents, but who sometimes take a wrong view of situations as they present when unacquainted with the conditions throughout the rest of the State

For this reason it is seen that many times a bill is left within a Committee or before the House for long periods of time before it is called forth or called up for passage. Thus it is allowed to the legislator to gather his facts and with discussion back home be thoroughly posted as to what his action should be

In some instances, however, as in every walk of life, there are physicians and there are legislators who are so selfish as not to be open to reason or who are unwilling to listen to argument without flying off the handle and abusing everything and everybody not in agreement with their position

The medical profession in this State as a whole has nothing to hide in its relation with the people, and as such can come before the legislators with clean hands as to questions that involve the profession and its relation to the people in the various lines along which legislative thought tends

It is to be hoped that in this session there will be accorded the same frankness and courtesy on the part of the profession toward the individual legislators as has been shown in past years and that as a profession we may meet each individual where he or we have matters of public interest to discuss with the same courtesy and kindness as has been heretofore shown

# State Department of Health

## TYPHOID BACILLI OBTAINED FROM AN INTRAMUSCULAR ABSCESS

According to a history received from the Albany Department of Health and from the physician attending the case, a patient was recently operated upon at the Albany Hospital for an intramuscular abscess occurring near the scar of a cholecystectomy operation performed in another city. Two months after the first operation, a tumor, circular in outline, pulsating in character, and firmly adherent to the abdominal muscle wall, appeared near the scar. A pure culture of typhoid bacilli was obtained from the contents of this abscess. Examination of a fecal specimen from this patient showed the presence of typhoid organism. In 1890, the patient had an illness which was diagnosed as malaria.

## "PERI-SPLENITIS"

An outbreak of about 125 cases of an unusual illness recently occurred in the practice of two physicians in Broadalbin and Mayfield. The distribution was entirely rural. The cases began about September 1st and continued during the month. They were characterized by a sudden onset of pain in the epigastric region, centering very soon about the spleen, with temperature ranging from 101° to 104°. The patients frequently had paroxysmal pain, similar to acute gall stone colic, requiring opiates for relief, and great difficulty in breathing, similar to an acute pleurisy. The attack lasted about 24 to 48 hours and was relieved markedly by a tight bandage across the lower ribs, broad enough to reach down to the level of the umbilicus. No enlargement of the spleen was observed, neither was any digestive disturbance noted. Aspirin for a day, followed by a generous dose of castor oil, seemed to be all the treatment needed.

One of the physicians noted that when the bandage restricting respiratory movements was removed too early the individual seemed to have a recurrence, with another two-day seizure. In the absence of a better term the attending physicians called this disease "Peri-splenitis." Sources of milk, water, and other foods were largely individual. It is not stated whether those affected had attended any social gathering in common. Nearly all the cases were male adults—20 to 60 years of age—but there were a few women patients. No children were sick. So far as known no laboratory specimens were submitted.

## PHYSICIAN'S NEGLIGENCE ALMOST RESULTS IN TRAGEDY

For years the fact that the normal habitat of the tetanus bacillus in the intestinal tract of domestic animals has been well established, and with this knowledge wise practitioners invariably administer tetanus antitoxin to any person with a wound liable to have been contaminated with manure. Recently, however, there came to the attention of the Department an instance of tetanus in which the wound had been contaminated with horse hair, and yet apparently no antitoxin had been given. Moreover, even after definite typical symptoms of tetanus had developed, the attending physician failed to recognize their significance and, according to the patient's statement, told him that his pains were only muscular.

The patient, a farmer, while driving a team of horses, slipped and ran a splinter under the nail of the middle finger of the right hand. His wife attempted to extract the splinter, but succeeded in removing only a small portion of it *together with a few horse hairs*. The next day, because of considerable pain in the finger, the patient consulted a physician, who made no attempt to cleanse the wound, but advised soaking the finger in hot water in the hope that the splinter would become loosened and the patient be able to remove it himself.

Twelve days later the patient complained of swollen neck, sore gums, pressure under the shoulders and slight stiffening of the jaw. Three days after this he once more consulted his physician who again made no attempt to cleanse the wound, and advised him, as stated above, that the pains were muscular.

During the next two days the patient became rapidly worse and another physician was called. He immediately recognized the case as one of well-developed tetanus. As this time the jaws were completely set, the abdominal, back and cervical muscles rigid, the patient had extreme difficulty in breathing and was covered with a profuse perspiration.

The original wound was opened widely and foreign matter removed. An attempt was made to administer tetanus antitoxin intraspinally without success, but through heroic doses of antitoxin intravenously and subcutaneously the patient was well enough two weeks later to leave the hospital.

# MEDICAL SURVEY

## MEDICINE IN TOMPKINS COUNTY, N Y

*Editor's Note* The survey on which this report was founded was made by the Executive Editor on December 4 and 5, 1924. For this information the Editor is indebted principally to Dr. Luzerne Coville, Vice-President of the Medical Society of the State of New York, Dr. L. T. Genung, Health Officer of Ithaca, and Dr. A. T. Kerr, Secretary of the Cornell Medical College at Ithaca.

Tompkins County is situated in the west central part of New York State. It has an area of 476 square miles. Its population is 35,285, according to the 1920 census.

The only city in Tompkins County is Ithaca, which is situated at the southern end of Cayuga Lake. It had a population of 17,004 in 1920, and had grown 13 per cent during the decade. It has few factories or other industrial concerns, but it is the site of Cornell University, which has a student body of over five thousand young men and women. The University is constantly expanding, and is one of the principal factors in the growth of the city.

The population of Tompkins County outside of Ithaca was 18,281 in 1920, and has been slowly decreasing for the last few decades. There are six incorporated villages in the County with a total population of 4,737. The County has a population of 13,544 that may be classed as strictly rural.

*Physicians* Ithaca has 46 physicians, according to the Directory of the Medical Society of the State of New York. This gives a proportion of one physician to every 370 of population. Many of the physicians are specialists whose consultation work extends over a radius of many miles around the city. Dr. M. B. Tinker, formerly president of the Medical Society of the State of New York, has attained national fame for his operations for goiter.

Tompkins County outside of Ithaca has 19 physicians who live in 13 localities. The rural section of the County has one physician in every 945 of population. Ithaca is the medical center of Tompkins and the surrounding counties. The nearest other centers are Geneva, 40 miles north, Elmira, 30 miles southwest, and Binghamton, 40 miles southeast.

The physicians and scientists of Cornell University have a marked influence on the physicians of Tompkins County and the neighboring districts, especially along the lines of scientific medicine. They have always been ready to give

their services as consultants and advisors, especially in public health matters, and they have placed their laboratories at the disposal of the physicians and health officers. Dr. Sutherland Simpson, of the Medical Faculty, is conducting extensive observations on sheep and goats from which the thyroids have been removed, and has frequently shown lantern slides and moving pictures of the animals before Medical Societies. The professors of the Veterinary College work on problems such as rabies and bovine tuberculosis, which are of vital interest to physicians and to human health, and they are always ready to cooperate with the doctors of medicine. The department of pathology and bacteriology is particularly helpful. The workers in zoology and botany also contribute to the scientific information which is of value to physicians. The result is a broadening of the scope of medical thought and a widening of the field of action of the physicians of Tompkins County.

*Medical Society* The Medical Society of the County of Tompkins represents the medical thought of the entire County, including Ithaca. It has 62 members, or 91 per cent of the physicians who are listed in Tompkins County. This percentage is extremely high, and is probably not excelled by that of any other county in New York State. The Society holds meetings monthly, except during July and August. Once a year a joint meeting is held with the Medical Society of the County of Cortland.

*Hospitals* Ithaca has one general hospital—the Ithaca City Hospital. The hospital has 105 beds, and is supported by private contributions, and by a grant of \$10,000 annually from the Community Chest. The city has recently appropriated \$92,000 for an annex with 36 rooms to be used for cases of contagious diseases. The hospital will manage the annex, and will receive pay from the city for the support of the cases. The annex will also be available for ordinary cases when the wards and rooms are not needed for contagious cases.

The hospital maintains an ambulance service, and the city pays for calls sent by the police or firemen.

The hospital has a staff of 44 local physicians, but no internes. Nine staff meetings are held during the year. A historian is employed who takes the original histories and indexes and files them, but the progress sheets are made by the physicians. The physicians of the staff find it difficult to maintain full efficiency in the histories

without an interne to relieve them of the detailed duties of caring for the sick

A dietitian is employed, and special attention is given to diabetic cases, and to metabolism studies

The hospital has an excellent laboratory in which the Department of Health work is done. The Wassermanns are sent to the State Laboratory in Albany, and the milk, water and rabies examination are done in the New York State Veterinary College of Cornell University

The hospital has a nurses' training school with 47 pupil nurses. It is in charge of Mrs Clifford, who is thoroughly competent and maintains the standards of the nurses' division of the State Department of Education

The hospital trustees have planned to extend the hospital work along three lines, first, an outpatient department, since there is no dispensary in the city, second, to assume the prenatal clinic work which is now done on a small scale in the health center, and third, to send the pupil nurses to private homes to assist in obstetrical cases

It is the intention of the trustees and staff to continue to develop the hospital service along original lines that are suited to the peculiar needs of the city of Ithaca, as they have done in the past

Tompkins County has a tuberculosis hospital with a capacity of about 20 cases. It is housed in a building that was formerly a residence. Its Superintendent, Dr Keith Sears, gives only part of his time to tuberculosis work, and does not live in the hospital, but he makes good use of his meager equipment, and holds clinics in Ithaca and other centers in the county

The Ithaca Tuberculosis Association conducts a summer camp or preventorium for undernourished boys and girls of tuberculous parentage. It accommodates about 25 children, and is open during the summer months. The children who return from the camp make regular visits to the clinic room in Ithaca during the rest of the year, for weighing and examination. The work is highly successful, and appeals for support and receives a ready response from the people

The Reconstruction Home for Infantile Paralysis cases is located in Ithaca. It was started to care for the local cases that developed in Ithaca during the great epidemic, but later it was promoted by rotary clubs and other organizations, and is now a reception center for cases within a radius of fifty miles of Ithaca. It has a capacity of 26 cases, and is always filled. About 200 cases have been admitted since the Home was founded. The ages of its patients range from 2 to 42, but most of the inmates are children of school age for whom the Department of Education of Ithaca supplies a teacher. The institution is managed by a local board of directors, and the medi-

cal service is supplied by the physicians of Ithaca under the unofficial supervision of Dr Leroy W Hubbard, Orthopedic Surgeon of the State Department of Health. The Home is efficiently conducted, and the reconstruction results are so satisfactory that the establishment of similar homes throughout the State is urged as the solution of the problem of the care of crippled children

The hospital capacity of Tompkins County is about 150 beds, if those in the Reconstruction Home are counted. This gives a proportion of 43 beds for every one thousand of population. But the Home and the Ithaca City Hospital are both used by patients outside of Tompkins County, and so the County has only about three beds available for one thousand of population

*Department of Health* The official public health work of Ithaca is centralized in one man, Dr L. T. Genung, who is both Health Officer and Medical Examiner of the city schools and gives full time to his official duties. He is assisted in his Health Department work by two part-time physicians, and by a full-time veterinarian for milk inspections, a nurse for general public health work, and a visiting nurse. His school staff consists of two nurses, a dental hygienist, and also a dentist who holds two clinics weekly

Dr Genung's office is also a health center which is supported jointly by the City and the County Tuberculosis Association. The health center receives \$3,900 from the Community Chest in place of conducting a sale of Christmas Seals in the city. Two clinics in tuberculosis and one each in child welfare and prenatal work are held weekly, and one mental clinic and one mentally defective clinic are held monthly. School children who show defects are treated in the Ithaca City Hospital with the cooperation of the physicians and the City Board of Charities

Special attention is paid to goiter prevention, since Ithaca is in the goiter belt, and a large proportion of the girl pupils in the schools show enlarged thyroid glands. The table salt that is sold in grocery stores is iodized

All the milk offered for sale in Ithaca is either pasteurized or is produced by tuberculin tested cows

*Public Health Nursing* There are nine nurses engaged in community health work in Tompkins County as follows

Ithaca Department of Health	2
Ithaca School	2
County Tuberculosis	1
County Red Cross, Visiting	1
Industrial Plants	3
	<hr/> 9

Ithaca has a community organization, called the West Side Social Service League, which has a great effect on public health. The League is located on the low lands of the western part of the city and is housed in a large building which is well adapted for games, meetings and classes. Its activities include a gymnasium, mothers' clubs, classes for cooking and sewing, and recreation for small children. It receives support from the Community Chest. It is well conducted and managed and supplements the work of the Health Center, the churches, and the schools.

*Newspapers* Ithaca has one daily paper, the *Journal-News*, which is published evenings. This paper cooperates with the health authorities and physicians, and is always ready to print medical information. We have had occasion to comment favorably on the *Journal-News* in our Daily Press Department (see page 327 of the March 7th issue).

*Medical Service of Cornell University* Cornell University maintains an excellent medical service for its resident students, who number about 3,800 young men and 1,200 women. The service may be considered under four divisions.

- 1 Dispensary and out-patient service to those who are mildly sick.
- 2 Hospital service to those who should be in bed.
- 3 Publicity and education along hygienic lines.
- 4 Periodic physical examinations of all students.

These four branches of medical service are the same as the activities which are promoted by the Medical Society of the State of New York, and physicians generally will be interested in the way in which Cornell performs the medical service.

Every student in Cornell pays ten dollars annually to the University for its health service. In return the student receives free dispensary advice whenever he wishes it, treatment and support in the University Hospital, a full physical examination every year with hygienic advice regarding the correction of defects and hygienic living, and classroom instruction in hygiene once a week for a year.

The Dispensary is located on the campus, and is open for medical consultation from nine o'clock in the morning until six o'clock in the afternoon. Nine full time physicians are in attendance. Over 25,000 consultations were sought by the students during the past year, or an average of five calls per student. This may seem to be a large proportion of calls, but it is the policy of the University to encourage students to consult

the Dispensary physicians on the first signs of illness or approaching disorders. This policy is further encouraged by the requirement that every student who seeks to be excused from classes on account of sickness or physical depression of any kind must obtain the excuse from the Dispensary. Three kinds of excuses are issued.

- 1 On the physical evidence of disease.
- 2 On certificate of a physician outside of the University.
- 3 On the statement of the student.

The University is liberal in issuing certificates on the first visit of the student, but it follows the case carefully and keeps accurate records with the result that there is very little malingering.

The University Hospital, called the Cornell Infirmary, has a normal capacity of 90 beds, only half of which were occupied on the day of our visit. It has a complete equipment, including laboratory and an X-ray outfit. The student is permitted to have a medical attendant of his own choice, but the University will supply medical services to any one who is unable to employ a private physician. The University sends students to the Hospital for observation on the first signs of fever or colds or other illness which may be dangerous to the patient or others.

The semi-annual examinations of all students is one of the oldest health activities of American colleges. Cornell has expanded this activity along modern lines, and provides the machinery to make corrective measures effective. The chief examiner is a deputy health officer of the city, and is empowered to deal with any health emergency that arises.

The semi-weekly classroom instruction is along practical lines, and is designed to give the students an intelligent idea of how not only to prevent disease, but also to maintain abounding health. The great number of calls at the Dispensary is evidence that the students are interested in the early signs of illness. A further indication of the practical character of the instruction is the extremely small number of cases of venereal diseases among the students.

The Cornell University health service covers all phases of medical attention which will enable intelligent persons to maintain their health and efficiency. It is not paternalistic, and the University does not assume responsibility for the health of any student. It offers health service on the only acceptance which is that they shall attend to their hygiene and have the necessary examinations. The Cornell University health service demonstrates the practical value of the Cornell Health Service.

without an interne to relieve them of the detailed duties of caring for the sick

A dietitian is employed, and special attention is given to diabetic cases, and to metabolism studies

The hospital has an excellent laboratory in which the Department of Health work is done. The Wassermanns are sent to the State Laboratory in Albany, and the milk, water and rabies examination are done in the New York State Veterinary College of Cornell University

The hospital has a nurses' training school with 47 pupil nurses. It is in charge of Mrs Clifford, who is thoroughly competent and maintains the standards of the nurses' division of the State Department of Education

The hospital trustees have planned to extend the hospital work along three lines, first, an outpatient department, since there is no dispensary in the city, second, to assume the prenatal clinic work which is now done on a small scale in the health center, and third, to send the pupil nurses to private homes to assist in obstetrical cases

It is the intention of the trustees and staff to continue to develop the hospital service along original lines that are suited to the peculiar needs of the city of Ithaca, as they have done in the past

Tompkins County has a tuberculosis hospital with a capacity of about 20 cases. It is housed in a building that was formerly a residence. Its Superintendent, Dr Keith Sears, gives only part of his time to tuberculosis work, and does not live in the hospital, but he makes good use of his meager equipment, and holds clinics in Ithaca and other centers in the county

The Ithaca Tuberculosis Association conducts a summer camp or preventorium for undernourished boys and girls of tuberculous parentage. It accommodates about 25 children, and is open during the summer months. The children who return from the camp make regular visits to the clinic room in Ithaca during the rest of the year, for weighing and examination. The work is highly successful, and appeals for support and receives a ready response from the people

The Reconstruction Home for Infantile Paralysis cases is located in Ithaca. It was started to care for the local cases that developed in Ithaca during the great epidemic, but later it was promoted by rotary clubs and other organizations, and is now a reception center for cases within a radius of fifty miles of Ithaca. It has a capacity of 26 cases, and is always filled. About 200 cases have been admitted since the Home was founded. The ages of its patients range from 2 to 42, but most of the inmates are children of school age for whom the Department of Education of Ithaca supplies a teacher. The institution is managed by a local board of directors, and the medi-

cal service is supplied by the physicians of Ithaca under the unofficial supervision of Dr Leroy W Hubbard, Orthopedic Surgeon of the State Department of Health. The Home is efficiently conducted, and the reconstruction results are so satisfactory that the establishment of similar homes throughout the State is urged as the solution of the problem of the care of crippled children

The hospital capacity of Tompkins County is about 150 beds, if those in the Reconstruction Home are counted. This gives a proportion of 43 beds for every one thousand of population. But the Home and the Ithaca City Hospital are both used by patients outside of Tompkins County, and so the County has only about three beds available for one thousand of population

*Department of Health* The official public health work of Ithaca is centralized in one man, Dr L. T. Genung, who is both Health Officer and Medical Examiner of the city schools and gives full time to his official duties. He is assisted in his Health Department work by two part-time physicians, and by a full-time veterinarian for milk inspections, a nurse for general public health work, and a visiting nurse. His school staff consists of two nurses, a dental hygienist, and also a dentist who holds two clinics weekly

Dr Genung's office is also a health center which is supported jointly by the City and the County Tuberculosis Association. The health center receives \$3,900 from the Community Chest in place of conducting a sale of Christmas Seals in the city. Two clinics in tuberculosis and one each in child welfare and prenatal work are held weekly, and one mental clinic and one mentally defective clinic are held monthly. School children who show defects are treated in the Ithaca City Hospital with the cooperation of the physicians and the City Board of Charities

Special attention is paid to goiter prevention, since Ithaca is in the goiter belt, and a large proportion of the girl pupils in the schools show enlarged thyroid glands. The table salt that is sold in grocery stores is iodized

All the milk offered for sale in Ithaca is either pasteurized or is produced by tuberculin tested cows

We have had occasion to comment favorably on the *Journal-News* in our Daily Press Department (see page 327 of the March 7th issue).

**Medical Service of Cornell University:** Cornell University maintains an excellent medical service for its resident students, who number about 3,800 young men and 1,200 women. The service may be considered under four divisions:

- 1 Dispensary and out-patient service to those who are mildly sick.
- 2 Hospital service to those who should be in bed.
- 3 Publicity and education along hygienic lines.
- 4 Periodic physical examinations of all students.

These four branches of medical service are the same as the activities which are promoted by the Medical Society of the State of New York and physicians generally will be interested in the way in which Cornell performs the medical service.

Every student in Cornell pays ten dollars annually to the University for its health service. In return the student receives free dispensary service whenever he wishes it, treatment and surgery in the University Hospital, a full physical examination every year with hygienic advice regarding the correction of defects and hygienic living, and classroom instruction in hygiene once a week for a year.

The Dispensary is located on the campus and is open for medical consultation from 9 o'clock in the morning until six o'clock in the afternoon. Nine full time physicians are in attendance. Over 25,000 consultations were requested by the students during the past year, or an average of five calls per student. This may seem to be a large proportion of calls, but it is the policy of the University to encourage student to consult

the Dispensary physicians at the first signs of illness or approaching illness. This policy is further encouraged by the requirement that every student who seeks to be excused from classes on account of sickness or physical condition of any kind must obtain the excuse from the Dispensary. Three kinds of excuses are issued:

1. On the physical evidence of illness.
2. On certificate of a physician outside of the University.
3. On the statement of the student.

The University is liberal in issuing certificates on the first visit of the student, but it follows the case carefully and keeps a constant record with the result that there is very little malpractice.

The University Hospital, called the Cornell Infirmary, has a normal capacity of 90 beds, only half of which were occupied on the day of our visit. It has a complete equipment including laboratory and an X-ray outfit. The student is permitted to have a medical adviser of his own choice, but the University Hospital renders services to any one who is unable to consult a private physician. The University sends patients to the Hospital for observation or treatment of fever or cold, or other conditions which are dangerous to the patient or to others.

The semi-annual examination of all students is one of the oldest features of the Cornell colleges. Cornell's examination is a modern, modernized examination. The examination is a general health examination. It is supervised by the University Health Service, which is a part of the Cornell University.

The semi-annual examination is a part of the Cornell University Health Service. It is a part of the Cornell University Health Service, which is a part of the Cornell University. The examination is a part of the Cornell University Health Service, which is a part of the Cornell University.

The Cornell University Health Service covers all phases of medical activity which will enable the student to take care of his health and efficiency for his personal life and the University. It does not assume responsibility for the health of any student. It offers health service, but the only assistance which is required of the student is that they shall attend classroom instruction in hygiene and have their annual physical examination. The experience of several years have demonstrated the practicality and efficiency of the Cornell Health Service.

Ithaca has a community organization, called the West Side Social Service League, which has a great effect on public health. The League is located on the low lands of the western part of the city, and is housed in a large building which is well adapted for games, meetings and classes. The experiences of several years have demonstrated the practicality and efficiency of the Cornell Health Service.

# Periodic Health Examinations

## MEDICAL SOCIETY OF THE COUNTY OF NEW YORK REPORT OF THE COMMITTEE ON HEALTH EXAMINATION GIVEN ON DECEMBER 9, 1924, BY ORRIN SAGE WIGHTMAN, M D, CHAIRMAN

At a stated meeting of The Medical Society of the County of New York, on May 26, 1924, the following resolution was adopted by the Society

RESOLVED, That The Medical Society of the County of New York immediately take steps through an appropriate committee, to formulate a feasible and workable plan to promote Periodic Health Examinations through the agency of the general practitioner

In line with this resolution the President appointed the following Committee

Orrin Sage Wightman, Chairman, Selan Neu-hof, Harry Finkelstein, Samuel A Blauner, Louis I Harris, Wendell C Phillips, Samuel J Kopetzky, Everett W Gould, Arthur Freeborn Chace, Terry M Townsend, Henry M Groehl

At the first meeting of the Committee the Chairman subdivided it under the following headings

### (1) *Education of the Physician*

\*Selan Neu-hof, C Ward Crampton, Chairman, Arthur F Chace, S A Blauner

### (2) *Technique and Methods of Securing and Filing Histories for Physicians*

L I Harris, Chairman, E W Gould, H M Groehl

Dr C Ward Crampton appointed in his stead

### (3) *Publicity for the Physician and the Public*

S J Kopetzky, Chairman, H Finkelstein, T M Townsend

During the past five years, the subject of periodic health examinations has attracted the attention of the medical profession, lay bodies and foundations, and the surveys and studies thus far made have shown the necessity of an economic consideration of it from a medical standpoint. In view of the fact that the physician must be the essential element in any plan for the carrying out of this scheme of examination, it is extremely important that the profession should take the leadership in outlining a sane and sensible solution of the problem

The matter is of so broad a scope and has received, comparatively, so little intensive study that your Committee has been required to give it careful analysis, particularly with the idea of presenting to the Society a plan both comprehensive and feasible

We realize that as public health is so impor-

tant a factor in the life of the community, unless the doctor takes the initiative in matters of this character, lay organizations and foundations may not only usurp the privilege but also demand legislative measures and the leadership which should naturally belong to the medical profession will be relegated to hands not properly equipped to cope with the situation

It was for this reason that your Committee gladly took up the work assigned to them and now attempts to offer you a plan which we hope and trust will be broad enough in scope to warrant your confidence and, at the same time, have possibilities of future growth which will further tend toward the betterment of the health of our citizens

The fundamental thought in formulating this plan has resulted in the sub-division of the subject into three primary requirements

### *First* The education of the physician

*Second* Some technique or method whereby physicians could properly secure the needed data in record form, which would be so simple as to meet the approval of the profession at large and yet contain sufficient subject-matter to be of value in the study of the histories of patients

*Third* That some method or means of publicity should be offered which would not be the burden of the doctor, but be rather the responsibility of foundations and lay organizations which could, as a civic and public duty, bring the need of Periodic Health Examinations before the people in general

It is highly undesirable that a profession which has resented the entrance of lay organizations into the scientific field of medicine—in some instances condemning their methods and their results—should appear to reverse its attitude and state that what was done formerly by the foundation alone was wrong, but now when done by the physician has become ethical and proper and of extreme value. The medical profession should rather be placed upon record as desiring Periodic Health Examinations done by properly qualified men, with carefully kept records, and the public coming to the doctor for his examination

Under the headings outlined above, your Committee has formulated a workable plan. Taking these up in order we would state

*First The Education of the Physician* The average medical graduate is thoroughly competent to make physical examinations, keep records, and carry out the requirements of Periodic

\*Deceased Dr C. Ward Crampton appointed in his stead

**Health Examinations** This idea of educating the physician is not primarily a matter of education, but, rather, of presenting ways and means which will not only refresh his memory but will make his work parallel with that of his brother physician when records are compared. In other words, the results of any examination to be of value must be uniform, and the method of examination must follow along parallel lines.

Another thing which must be borne in mind is that many people who come to a physician for a Periodic Health Examination, have learned through years of association to have a regard and reverence for this particular doctor. The patient may not have realized that through this long period his physician has gradually developed some specialty which has taken him out of the realm of general practice. The patient's feeling is that what his old doctor says must be so. This is very flattering to the physician, but if he is to be just to himself and expects to reassure an inquiring patient as to his health, it is very necessary that he again take up some of the fundamentals, long laid aside, in order to secure a really satisfactory examination of his patient.

Your Committee has felt that the most important phase of this work is to do away with perfunctory examinations, incomplete tests, and hasty conclusions, not justified by a scientific method of procedure. In other words, if a Periodic Health Examination is to be worth anything to the patient, it should be done properly. We therefore, under this head, offer you the following:

We feel that it is necessary to send to the medical profession a circular, explaining the breadth and intent of this work and stating:

- (a) The outline of health examinations,
- (b) The scope of health examinations,
- (c) What the health examination should comprise,

- (d) Information relative to health examinations, including post-graduate courses, the bibliography of literature at present published, etc.

We have also arranged for a complete set of lectures in the form of a symposium. Those are to be given on Tuesdays and Thursdays, beginning January 6, 1925, and will follow a prescribed course, as outlined by the Chairman of the sub-Committee. With this literature, bibliography and the proposed symposium of lectures for the physician, we feel that a good beginning will have been made toward launching Periodic Health Examinations with the medical profession.

We will give the physician a chance of knowing what the Periodic Health Examination should be, its scope, its intent, and where he may take up any course of study that he feels is necessary. We will put him in touch with specialists in our symposium who will give him the angle of the specialist with particular reference to exam-

ining his patients and emphasizing abnormalities that count, and, in addition, we will refer him to the Academy's library, where he can further study all of the literature referred to.

The second phase has been the development of some simple method whereby the profession could adopt a technique for filing histories which would be accurate and uniform. With this in mind your Committee desires to offer the history examination card, which was compiled after exhaustive studies of the blanks offered by Kings County Medical Society, the American Medical Association, the New York Board of Health, and various insurance companies. The result of this study has been a card 5 x 8 in in size (standard for records) which we hope will offer a basis to meet the necessary demands for uniform filing.

Your Committee further feels that the physicians should be assisted in filling out this filing card by a question guide for health examination, and therefore it offers you a Guide Card which will enable the doctor to correlate his findings for record on his filing card.

We feel that this Guide Card for use by physicians is very necessary, as much space is usually provided on examination sheets for data, little of which is of a positive character. The attempt of your Committee was to concentrate on the preservation of findings which would really be valuable, rather than the filling in of a long card which recorded little of permanent value. We feel that this questionnaire will enable the physician to thoroughly question his patient so that abnormalities will not escape him.

Another point seriously considered and adopted by your Committee is the necessity for recording abnormalities discovered by the physician and suggestions for their correction. Both the findings and the corrections are to be handed to the patient on the completion of his examination on separate stationery or on some form devised by the physician, but complying with the blank as offered by your Committee for the purpose. This will enable the physician to make a thorough examination, to keep his files complete, and, at the same time, to give the patient the findings and suggestions which normally belong to him, without giving him a duplicate of the record which is perfectly proper for the doctor's files, but which, if given to the patient, might be a source of annoyance not only to the doctor but to the patient himself.

The third sub-division of our work has been the consideration of the matter of publicity for the physician. As previously stated, we have been reticent about suddenly approving or the physician's doing what we previously condemned when done by lay organizations. Your Committee realizes that it is difficult for us now to go to the public and tell them that they need

**Periodic Health Examinations** We want to be ready and qualified to do this work, but it is eminently more fitting that organizations particularly equipped for publicity work should bring the need of medical examinations to the public. We should be equipped to do it, but should not be the ones to advise them to have it done.

A source of former criticism by the medical profession was that lay organizations were frightening the public into real or imaginary troubles, intensifying minor abnormalities into serious complaints, and then by a process of correlation were giving out extensive reports to the public, some of which were subsequently proven to be either over-emphasized or inaccurate. This led to the suspicion on the part of the medical profession that lay organizations attempting health work frequently frightened patients into the idea that they were seriously affected for the pecuniary return that might accrue.

Therefore, the medical profession must be doubly careful that this whole matter of publicity should be brought to their attention by outside

organizations and that they be prepared to co-operate, rather than that they take the attitude, as previously stated, that what was formerly wrong is now right.

With this larger conception of the subject in mind, the sub-committee on publicity has sought the assistance of certain lay organizations, such as the Milbank Foundation, the New York Tuberculosis Association, and other organizations engaged in publicity work, and these organizations, in turn, have promised us aid in bringing the importance and need of Periodic Health Examinations to the public. They all naturally require an outline as to what our aims are, what program we have in mind, and what it will cost to carry out these ideas. They have offered us freely street-car ads, radio talks, and a speaker service, and, under our guidance, will do what circularizing we wish, thus co-operating in every way with the medical fraternity.

Under the circumstances, the large scope of this work cannot but succeed with so universal an approval of the greater motive we have in view.

## PREPARATION FOR MAKING PERIODIC HEALTH EXAMINATIONS

The Committee on Periodic Health Examinations of the Medical Society of the County of New York, acting with a similar committee of the New York Academy of Medicine, has arranged a symposium on The Preclinical Signs of Disease with special reference to the management of the Health Examinations. The symposium will be held in nine sessions, each of which will consist of two lectures by prominent clinicians. The sessions will be held in the Academy of Medicine at four o'clock on Tuesday and Thursday afternoons. The program is as follows:

January 6—The Gastro-Intestinal Tract, Arthur F Chace, M D Orthopedics, Reginald H Sayre, M D

January 8—The Heart and Circulation, Walter L Niles, M D Infections—Infectious Diseases and Immunization, William H Park, M D

January 13—The Nervous System, Foster

Kennedy, M D Gynecology, Charles G Child, Jr, M D

January 15—Genito-Urinary System, Edward L Keyes, M D Skin and Syphilis, Howard Fox, M D

January 20—The Respiratory System, James Alex Miller, M D Eye, Ear, Nose and Throat, Daniel S Dougherty, M D

January 22—Pre-Surgical Conditions including Cancer, Eugene H Pool, M D Endocrinology, Walter Timme, M D

January 27—Allergy and Pre-Asthmatic Conditions, Robert A Cooke, M D Metabolic Diseases—Diabetes, Rheumatism and Gout, H O Mosenthal, M D

January 29—Occupational Hazards—Fatigue, Work and Rest, Louis I Harris, M D Pediatrics, William St Lawrence, M D

February 3—Prescription and Management of Exercise, Prescription and Management of Diet, Summary, C Ward Crampton, M D

## PRE-CLINICAL SIGNS OF DISEASE OF THE GASTRO-INTESTINAL TRACT

By Arthur F Chace, M D, Professor of Medicine, New York Post-Graduate Medical School

Abstract of the first lecture in the symposium on Periodic Health Examinations given in the New York Academy of Medicine on January 6, 1925, under the auspices of the Medical Society of the County of New York.

The Periodic Examination is the practice of

pre-clinical medicine, or the examination and treatment of apparently healthy persons. The object is not only to detect the signs of approaching debility, but also to advise the one examined how to prevent the development of the debility. Physicians have been accustomed to think of the prevention of sickness only in connection with contagious diseases, but it also has its applica-

tion to chronic troubles of a functional nature. The practice of pre-clinical medicine involves a consideration of the first signs of a functional trouble which, if unrelied, will go on to organic disability, or sickness, or death. For example, a man has a tendency to an ulcer of the stomach. It is the duty of the examining physician not only to detect the signs of conditions which may lead to an ulcer, but also to advise the patient what to do to avoid the ulcer.

We will confine our attention to the pre-clinical signs of gastro-intestinal disease. Suppose an apparently well man comes to you for an examination, and all that he complains of is that he is not so full of activity as his team-mate in business. The physician will first observe the man for any tendency toward disease. His skin may be sallow, scaly, or red, or his nose may betray his drinking habits. His breathing may be panting and labored. A metallic taste in his mouth may suggest indicanuria. His coated tongue may point to liver insufficiency, or a red tongue may betray an over-acidity of the stomach and a tendency toward gastric ulcer. A long waist or distance from the sternum to the pubis may indicate gastropnoia. A splashing sound over the stomach indicates gastric relaxation, and a flabbiness over the cecum betrays a stasis in the beginning of the large intestine,—the cesspool of the body. Localized tenderness or pain suggests appendicitis or cholecystitis.

In a periodic examination, do not neglect an inspection of the rectum. A small, hard nodule that gives no trouble at all may be the beginning of a cancer, which can be completely cured in that stage of its development.

These are the main points to observe in making a hasty physical examination of the gastro-intestinal tract. Now, let us consider symptoms.

There are four principal organic diseases of the gastro-intestinal tract to be considered in an adult. 1. Appendicitis, 2. Cholecystitis, 3. Ulcer of the stomach or duodenum, 4. Cancer.

Heartburn is a symptom which is suggestive of future trouble. An ulcer is usually preceded by a long history of sour stomach for which soda or other alkalis have been taken. For example, a prominent physician apparently in good health passed a tarry stool while on a train going to read a paper before a medical society. On his return he had to spend six weeks in bed while he underwent treatment for a gastric ulcer. He had a chronic heartburn, and had been in the habit of taking soda for its relief for months, and yet had not thought it necessary to consult a brother physician. If he had eaten food which did not produce excessive acidity of the stomach, he would have avoided the ulcer.

Cancer also has its suggestive signs. A slow progressive trouble with food in a person who has been well previously is a suggestion of

cancer. For example, a watchman in a dispensary came for an examination because his wife said he had become fussy over his food. His abdomen showed a cancer the size of a hen's egg.

Difficult and painful swallowing in a person past fifty years of age suggests cancer of the esophagus.

A chronic irritation of the stomach is often the only subjective symptom of appendicitis or cholecystitis. An inflammation of the gall bladder is likely to produce gallstones, which can be relieved only by operation, but in every case there is a time when the inflammation may be relieved by such means as lavage or colonic irrigations.

We will now consider the common signs of functional disorders of the gastro-intestinal tract. These are as important as the organic disorders.

Constipation and the retention of toxic substances often result in mental depression and dullness, migraine, and other nervous disorders. Many persons who suppose they have good bowel movements daily have a retention of much toxic substances. Make a test by giving a capsule of carmine or charcoal, and seeing how long the coloring matter persists in the movements. A normal person excretes all of it within two days, but specks of it appearing for five or six days indicate constipation which requires treatment, and which, if neglected, may produce colitis and other inflammatory conditions.

Observation of the bowel movements may reveal much of what is taking place in the intestine. A dark, foul stool indicates protein putrefaction. A light, foamy, gaseous stool indicates carbohydrate fermentation, which is often difficult to overcome.

Four chronic conditions outside of the gastro-intestinal tract are likely to give gastro-intestinal symptoms. These are 1. Incipient tuberculosis, 2. Nephritis, 3. Cardiac decompensation, 4. Cirrhosis of the liver.

An indigestion is very often the first sign of pulmonary tuberculosis that is noticed, and to it is ascribed the usual loss of weight. A progressive indigestion always calls for an examination of the lungs.

Kidney disease often produces an indigestion which is the only sign that calls attention to the urinary disorders. An examination of the urine is not complete unless an indican test is made. Cirrhosis of the liver often has an insidious onset with indigestion as its prominent symptom. Look for confirmatory signs, such as sallowness and a coated tongue.

Making a periodic examination consists in thinking of the conditions which precede the more evident signs and symptoms of disease, and considering what these conditions may lead to if they are not treated.

# NEWS NOTES

## THE GOVERNOR'S MESSAGE

Governor Alfred E. Smith devoted the unusually high proportion of 10 per cent of his Annual Message, on January 7, 1925, to public health topics. He says "Preservation of public health is an important part of the business of the State of New York. We know how to reckon its value. Our State Department of Health furnishes one of the best illustrations of what a consistent policy, extended over a period of years, will accomplish."

Governor Smith then proceeds to comment at considerable length on some of the accomplishments of the Department of Health, especially in the saving of the lives of infants and of women in childbirth. He comments on the work of the orthopedic surgeons among crippled children, and on the survey now being made to determine the extent of the problem of this care. He describes the State aid in public health nursing and local laboratories, the protection of the people against smallpox and tuberculosis, the eradication of bovine tuberculosis, and the protection of oysters from sewage pollution.

The Governor commends the attempts to pass an efficient Medical Practice Act, and says "This is not a political or partisan matter. It concerns the health and lives of the people of this State. I earnestly hope that the present Legislature will give this matter careful consideration, and enact legislation which will justly and effectively safeguard the public health and enforce the Medical Practice Act."

The Governor concludes the public health part of his address with a consideration of the needs of the State Hospital service. He especially commends the mental clinics, and says "There is an urgent demand that the work of these clinics be extended to problem children, to the end that early criminal tendencies may be checked, faulty mental habits corrected, and proper adjustment of the child to his environment be made."

Governor Smith has dignified public health work, and made its importance co-ordinate with that of the State's finances, canals, militia, and other great activities of the State government.

## SURVEY OF CRIPPLED CHILDREN

The New York State Commission for the Survey of Crippled Children desires the aid and co-operation of the physicians of the State in its attempt to enumerate and classify crippled children.

This commission, created by the last Legislature, consists of eight members, four members of the Legislature, and a representative of each of the State Departments of Health, Education, and Charities, and the New York State Society for Crippled Children. Senator William T. Byrne is chairman of the commission, and the survey is under the direction of Henry C. Wright of New York, director of the Hospital and Institutional Bureau of Consultation.

In general, the program of work of the Commission includes, on the one hand, enumerating and classifying the different types of crippled children of the State, and on the other hand, finding the existing facilities for medical, surgical, and convalescent care, and for general and special education and maintenance.

The general procedure of locating cripples is through the means of the school teachers, aided by physicians, nurses, and various persons inter-

ested in each community. Census cards are beginning to be returned in good numbers, and in most cases, the physical condition has been rechecked by the family physicians or school medical inspectors. The chief shortcoming in the returns so far, is the failure to locate as large a proportion of crippled children under school age as probably exists. These cripples are not, of course, on the school register, and must be located through other school children and their physicians or friends in the community that have knowledge of them.

Greater New York has not been included in this school census because facts in regard to the number of cripples were secured in the census made there in 1919-1920.

The Counties of Cattaraugus and Onondaga are also omitted because of surveys being made by Health Associations in these two counties.

Although the Commission does not yet have sufficient facts on which to formulate a definite program, certain needs are already evident. One of these is the necessity for some automatic means of reporting and registering all crippled children from birth to 18 years of age. The only existing public record of children is that which

is made by school enumerators, and this, of course, includes children of school age only

If all parents, when a child is injured or afflicted with a disease that may cause him to be a cripple, would call in a family physician, the case would undoubtedly get attention, but unfortunately, many parents do not ask medical aid and do not report such cases. The census of cripples in New York City in 1919-1920 revealed the fact that nearly fifty per cent of cripples had not been reported to physicians nor had received other medical attention. These children were chiefly of foreign parents who probably feared that their children would be taken away from them if they reported to public authorities or physicians, or that some operation would be per-

formed that would result in death. It is probable that the same fear is in the minds of ignorant parents throughout the State of New York, and that many children are crippled by accident or disease without that fact becoming known to any physicians, hospitals, or clinics. This situation makes it imperative that some procedure be adopted by the State to discover crippled children who are not revealed by physicians.

The Commission urgently requests the physicians throughout the State to assist the school teachers in locating all crippled children, and particularly to aid the teachers in rechecking the record of physical defects.

HENRY C. WRIGHT,  
Director of Survey

## THE MEDICAL SOCIETY OF THE COUNTY OF KINGS

The December *Bulletin* of the Medical Society of the County of Kings contains an appreciation of its leaders which will apply equally well to any other live County Medical Society. We are printing it as an ideal answer to those whose minds run to destructive rather than constructive criticism.

"A certain type of physician says no. I never go to the meetings. They're the same old things. Yes, a clique, an inner ring, run things to suit themselves. They skim the cream. The glory I don't know what's going on. I'm not interested."

"The president is your leader—chosen by you—not by a clique. He is not 'made' by the office. He makes the office, having earned a distinct reputation as a leader in the field of medical endeavor. His year in office is one of hard, untiring effort. The position pays no salary directly or indirectly. The reverse is true. The office of president is one of ceaseless labor, hard work, and minus glory or profit."

"Therefore, every member should get in the game. The small mind should learn the true facts and stop casting slurs. Rather, it is up to him to admit his sin and reform by putting his shoulder to the wheel and doing something worthy for the good of the order."

"But, upon reflection, maybe we are wrong. A clique may run things, after all. The chairman of a committee has invited an out-of-town man to address us. That chairman is allowed to entertain the guest at dinner, perhaps arrange a theatre party for him. In the course of events motion pictures may be exhibited. The projection machine (perhaps, two of them), the booth, the operator—all costs money. You think

the Society foots these bills? Nay, brother, nay, it is one of the honors permitted the chairman."

The Joint Committee, Graduate Education met and organized. Money was needed to do business. No. The Society did not advance it. Instead, each and every member of the committee wrote a check and underwrote the undertaking. Glory!! Quickly, now. Who are the men on that committee? Do you know that certain unnamed gentlemen have pledged themselves the sum of \$250 each year for a certain work? Close as we are to the 'know' we cannot tell offhand who these gentlemen, hungry for glory, are.

"Look beneath the surface and you'll find the clique to be an unorganized number of physicians who love the society, who have stood by it for years through thick and thin, fat and lean, who made enviable reputations without the aid of the society, who have given their time, of their pocketbook, their thought, and their devotion to the society. They are ever on the lookout for the man with ability to be a leader eager to get behind that one and lead him to the high places, asking only that he, too, love the society and will make good. We have learned to our sorrow that such men are hard to find. And so, if you are a critic, a student of theories, if you can measure up to these specifications, a place is waiting for you."

"There always will be leaders. I suppose there always will be scoffers, little men who stand off and bark from a safe distance. But the scoffers never created or built up. So after all, it is the clique, the leaders, who are the safe ones to pilot our craft through the waters."

### THIRTY-EIGHT PHYSICIANS SEEK RURAL PRACTICE

Considerable concern has been manifested by welfare associations and those interested in rural community life, by the apparent growing tendency on the part of physicians to move their residence from the rural districts to the larger centers, where hospital and laboratory facilities will be more accessible. In some instances this withdrawal has occasioned considerable alarm on the part of the community thus apparently forsaken.

A more careful study of the problem recently thrust upon this office has afforded an opportunity for seeing the matter from another angle. In a majority of instances the community lost its old family physician because "Father Time" had a claim upon him, and no young man has offered to take up his practice because, with the advent of the automobile and good roads, it is possible for the residents of such communities to call a physician in attendance in less time than could the old family physician, when he was a young man, attend their fathers. The forlornness of these communities is, in many instances, considerably exaggerated through sentiment. The fact that the country store which at one time prospered at the cross-roads, has disappeared, has been accepted as a normal evidence

of development. The farmers, with their automobiles, prefer to do their shopping in the larger centers, and are justified in doing so. Likewise, when they are in need of medical service, not emergency in character, they also prefer to seek such service in larger cities, and are capable of doing so with the aid of the automobile. Thus the physician living in the rural district is overlooked and the more lucrative practice is carried to the city, or the city physician is induced to come out, which he willingly does when the roads are passable, and the high regard which the community feels for this local physician never comes to the surface until he, responding to the pressure of conditions, decides to take up his residence in a larger center.

That physicians would be willing to live in rural districts, providing they could do so and effectively "keep the wolf from the door," is manifested by the fact that within the last month thirty-eight physicians have written to this office asking for a list of rural communities in need of physicians. Unfortunately we had at our disposal only four places where the County Medical Societies thought physicians might be able to develop a practice warranting their taking up the location.

### TRAINING NURSES FOR TUBERCULOSIS WORK

The following resolution was adopted by the Public Health Committee of the New York Academy of Medicine:

WHEREAS, There is a well recognized and widespread need of trained nurses for the care of tuberculosis patients, and

WHEREAS, The nursing of such patients requires a special technique which, as a rule, is not taught in the course of the training of registered nurses for the reason that most of the hospitals in which such nurses are trained do not take cases of pulmonary tuberculosis, and

WHEREAS, It is found that registered nurses as a rule give themselves up to the care of pulmonary tuberculosis with great reluctance, or not at all, and consequently there is a very great shortage of properly qualified nurses to take care of this large group of cases, and

WHEREAS, The chief source of supply of nurses for the care of pulmonary tuberculosis is from women who have themselves had tuberculosis and been cured of it,

*Therefore Be It Resolved*, That the Public Health Committee of the New York Academy of Medicine favor an amendment to the Nurse Practice Act which shall give official recognition with a suitable title to graduates of training schools operated in conjunction with tuberculosis sanatoria in this State, provided the sanatoria meet the requirements to be established by the Board of Regents and provided the course of instruction be of at least two years' duration and that it meet also any specific requirements for the training of nurses to care for the tuberculosis sick, which shall be formulated jointly by the Board of Regents and representatives of the tuberculosis sanatoria in the State.

Official recognition of this type of nurse with a suitable title would be similar to the recognition accorded to graduates of training schools in the State institutions, or institutions under the visitation of the State Hospital Commission (Chapter 742—Public Health Laws of 1920, Paragraph 252—c)

# PRIZE ESSAYS

## COMMITTEE ON PRIZE ESSAYS

The Committee on Prize Essays takes pleasure in once more drawing the attention of the members of the Medical Society of the State of New York to the Merritt H Cash prize and the Lucien Howe prize, which will be open for competition at the next annual meeting of the State Society, which will be held in Syracuse on May 11, 1925

The Lucien Howe prize, consisting of a medal and \$50 in cash, will be awarded for the best original contribution to the knowledge of surgery, preferably ophthalmology, and is not limited to the members of the State Society, any physician being at liberty to compete for it

The Merritt H Cash prize of \$100 will be awarded for the best original essay on medical or surgical subjects and is only open to members of the Medical Society of the State of New York

The essay shall be typewritten or printed, and the only means of identification of the author shall be a motto or other device. It shall be accompanied by a sealed envelope, having on the outside the same motto or device, and containing the name and address of the writer. Essays must be sent to the chairman of the committee, Dr Lucien Howe, 520 Delaware Avenue, Buffalo, N Y, not later than the first of April, 1925

### CONCERNING THE PRIZE IN OPHTHALMOLOGY

It is probably worth while to call the attention of the Society to the prize in ophthalmology and to changes adopted last year concerning the method of awarding the medal

In America the idea of a medal for distinguished service in science is comparatively new. But it is a plan long since recognized in England and especially on the continent. Thus, the Royal College of Physicians of London awards two. The Royal College of Surgeons of England awards the John Hunter gold medal, also an entire series known as the Blane gold medals and the honorary medal of the college. L'Institut de France, Academie des Science, awards also medals or prizes, some of them being of unusual value. The same is true of the "Nobelstitten" of Stockholm. Numerous other medals are offered to savants in other foreign countries for re-

searches in various branches of medicine and surgery

In America prizes such as the Boylston prize of Harvard and the Cartwright prize of the College of Physicians and Surgeons of New York, are usually in money, although the well-known Knapp prize is in the form of a medal.

Moreover, the decorations given to American soldiers and sailors, by other countries and by our own, have taught democratic America that service for country, as for science, can not always be paid for in dollars and cents, as well as it can by some mark of appreciation, however small in itself, which can be held permanently by the recipient and then handed down to his children and to his children's children

It is not surprising, therefore, that one who has been a member of our State Society for nearly half a century should have followed the example of a still earlier member in giving to the Society several years ago some fifteen hundred dollars, understanding in general terms that the interest on that amount was to be awarded for some essay of special merit relating to ophthalmology. But as experiences proved that evidences of research, as shown by essays restricted entirely to that branch, were offered only occasionally, and also that some earnest students would much prefer a medal in recognition of their achievements to a prize in money which would later vanish, therefore the donor of the prize, who was last year the chairman of the committee, and the two other members associated with him, recommended that as the annual income from the fund originally given to this Society now amounts to over one hundred dollars, that when the prize is awarded it shall be in the form of a gold medal to cost fifty dollars, the other fifty dollars to be expended in printing and distributing copies of the essay for which the prize was awarded

The committee also recommended that the chairman should resign each year and a new member be chosen by the President of the Society that choice being such that the committee shall always consist of two ophthalmologists and one general surgeon

The final and important recommendation was that the competitors for the prize shall present their material to the chairman of this committee at least one month before the annual meeting of the society. This means, evidently, that anyone who has been engaged in real research in ophthalmology or in any of its allied branches of surgery, should lose no time in completing his work if he has any idea of competing for this prize

# COUNTY SOCIETIES

## MEDICAL SOCIETY OF THE COUNTY OF ALBANY

The annual meeting of the Albany County Society was held Tuesday evening, December 9, at the Auditorium of the Municipal Gas Company. Dr Edgar A Vander Veer presided.

The following members were unanimously elected to the Society: Drs James R Lisa, Emily A Pratt, and Wesley A Van Deusen.

The following officers were elected for 1925: President, Henry L K Shaw, vice-president, William P Howard, secretary, Clarence Graham, treasurer, James Lyons. Censors: Drs John E Heslin, Clinton Hawn, Brayton E Kinne, Frederic C Curtis, Arthur Holding. Delegates: Dr Nelson K Fromm, Arthur Dickinson, L H Gorham. Alternate Delegates: Drs Wm E Lawson, Thomas O Jenkins, Harold Peck.

A rising vote of thanks was given to the retiring officers.

The death of the late Dr William J Nellis was brought before the Society by the President, who appointed the following committee to draw resolution on his death: The doctors are Frederic C Curtis, James W Wiltse, Louis LeBrun.

Dr Arthur J Bedell gave notice of an amendment to the constitution to be presented at the June meeting.

Dr H D Cochrane, of Albany, gave an interesting talk on "Evacuation of Wounded in Campaign."

A special committee called the "Committee on Economics," composed of the following members: Arthur J Bedell, James F Rooney, Frederic C Conway, presented the following written report:

"We have considered the economic aspect of the profession and feel that many conditions which have caused friction have to some degree been removed.

"It cannot be said that one of the most pressing conditions has been entirely rectified. That is the relationship of members of the profession to the Workman's Compensation Law. It is believed, however, that the fee question is more satisfactory than in the past. There are certain matters relating to this bureau, however, that are in the opinion of your committee manifest evils, especially the practice which is tolerated and we think it may be said, encouraged by the Labor Department and the insurance carriers of engaging physicians to act for all three parties, Labor Insurance carrier and employer, and the patient or claimant.

"It must be evident to any normal mind that this situation can be and is not only a temptation to evil, but that it does enure to injustice either to claimant, carrier or the State or to all three. If one were to suggest that in an action in equity tried in court one attorney should be the Judge, the jury and the party at bar, it needs but the statement to show its ridiculousness.

"There are many instances where injured workmen are being deprived of the best medical services because they must be treated by certain physicians who are designated by the carrier who has contracted with them for either a stipulated price for treatment which is less than the usual to the best in the profession or a salary contract, lump sum per annum. This condition of affairs we believe leads to prolongation of the period of disability or downright quackery.

"Some physicians are charging carriers extravagant fees for services which are unnecessary, ineffective or superfluous. This may in part be due to carelessness or ignorance, but is frequently because they believe a corporation pays the bills. Certainly we must rectify the evils, few though they may be, existing among ourselves, before we can properly ask action to remove those which afflict us.

"Your committee reviews with regret that the high ethical standard the ideal which has animated the profession, is slowly but with increasing rapidity, deteriorating and sinking into the morass of industrialism and commercialism. The increasingly common tendency to consult with those who are now by statute covered by the professional toga and others who are not licensed to practice medicine in this State, is a saddening fact which must be deprecated.

"It is desired to draw attention of the Society to the economic features concerned in certain proposed legislation in the House of Delegates of the American Medical Association which is to be introduced in Congress, relating to amendments of the National Prohibition and the Harrison Narcotic Acts, reducing the formalities required by the former and extending the physician's rights to prescribe and in the latter reducing or abolishing the unjust tax.

"A serious economic question which is becoming more prominent and more threatening is the gradual consolidation of all medical powers, appointments and employment in the community, municipality, the State and the Nation, in small consolidated and through chance, not necessarily

able, powerful groups This is really the industrialization of the medical profession It can well be seen by viewing the results of this process in other aspects of this so-called civilization, that its tendency is to aggrandize power in an oligarchy and to enslave the mass No great creative things have ever risen from an oligarchy or slavery, but there has grown out of both frightful evils that have only been washed out in the birth pangs of revolution The medical profession in its very nature if it is to perform its function of healing, is and must remain individualistic, freedom of opportunity and advancement must be based on ability and efficiency only, it cannot be governed by the same standard as romantic love where kissing goes by favor The domination of the profession by highly financed lay-interests is overwhelming, this dictation counseled though it may be by certain self-constituted authorities who are, however, in the end not at all responsible for or to their medical colleagues, is becoming a menace This tendency

should be mightily resisted else the profession will become merely an arm moved by another's brain

"Your Committee, therefore, presents the following recommendations

"1 That a committee of five be appointed to act as the official intermediary of this Society in the matter of differences of any sort that may arise among the parties at interest under the Workmen's Compensation Law, this Committee to be titled the Compensation Arbitration Committee No physician of the Society shall be eligible to this Committee who has a contract or agreement for constant employment with any of the parties at interest

"2 That the Secretary be directed to inform the United States Senators from this State and the Representative in Congress from this district of the action of the Society in relation to the proposed amendments to the National Prohibition and the Harrison-Narcotic Acts "

### TOMPKINS COUNTY MEDICAL SOCIETY

The Annual Meeting of the Tompkins County Medical Society was held Tuesday evening, December 16, 1924, in the parlors of the Board of Commerce, Ithaca, N Y, President Parker in the chair

The minutes of the November meeting were read and approved

The Comitia Minora reported that membership dues will be the same as last year, \$3 00

Election of officers for the ensuing year resulted as follows President, Dr John W Judd, Ithaca, Vice-President, Dr Keith Sears, Trumansburg, N Y, Secretary-Treasurer, Dr Wilber G Fish, Ithaca, Censors, Drs Luzerne Coville, L T Genung, W F Lee, H G Bull, W B Holton

Applications for Associate Membership were received from Prof Henry N Ogden of Cornell, Sanitary Engineer and member of the State Public Health Council, and Dr W A Hagan, Pathologist and Bacteriologist in the State Veterinary College at Cornell Being properly recommended and endorsed by the Censors they were duly elected to Associate Membership

A summary of the report of the Treasurer showed a balance on hand December 18, 1923, of \$101 84 Cash received during the year \$568 Cash paid out \$655 97 Balance on hand this date, \$13 87

The Secretary's report was as follows

The Society began the year with 65 Active members, 30 Associate, and one Honorary member A total of 96

One Active member died during the year and two Associate members moved away

One Active member has been gained by election

We therefore close the year with 65 Active members, 28 Associate and 1 Honorary member, a total of 94

A short analysis of our membership may be interesting

Of 55 practicing physicians in the county 53 are members

Of 39 practicing physicians in the City of Ithaca 38 are members

Of the 65 holding active membership, 7 are not in practice

Of these 7 one is President of Cornell University One is Dean of the Medical College of Cornell at Ithaca One is Professor of Histology and Embryology in the same college One is Dean of the State Veterinary College at Cornell One is in the Laboratory of Parke Davis & Co at Detroit One prefers the selling of life insurance to practicing medicine One retired from practice upon annexing an M D husband

Among others not in general practice, one is Medical Advisor of Women at Cornell University Two are in Government service without the State One is in the Health Service of the Ohio State University at Columbus, Ohio Eleven are Health Officers and one is Coroner

The Society has held 10 regular meetings during the year at which 16 scientific papers were delivered Eight of these were by members and

eight by men of high standing in the profession from New York City, Cleveland, Rochester, Syracuse and Utica

Both the Annual Banquet, held in March, and the joint meeting with the Cortland County Society held in June were very successful and fully enjoyed

During the year our meeting place has been changed from rented quarters to the very convenient and comfortable parlors of the Board of Commerce for which we are charged no rental I venture to suggest, that in order to show our appreciation of this courtesy, the Society, as such, should take out a membership in the Board of Commerce

Madam President If I may be allowed to include in this report some matters which, under strict interpretation, may be considered extraneous thereto, I would like to suggest the Society may profitably consider the coming year, some matters heretofore but lightly touched upon

1 Why not a meeting devoted to the business needs of the profession with talks by one or more bankers or business men on such subjects as investments, business methods for the professional man, wills and estates, etc

2 Why not the Committee on Public Health arrange a meeting devoted to public health matters, both state and local, with the City Board of Health and the eleven Health Officers of the county who are members of the Society and the District State Health Officer taking part?

3 Why not work with the City Officials and the staff and Board of Trustees of the City Hospital to the end that when the contagious wing is built there may be a room so arranged and fitted that clinical cases may be safely, easily, comfortably and properly be presented to Staff and Medical Society meetings to be held therein?

4 Why not get in closer touch with the Dental and Nurses' societies of the city, possibly by joint meetings occasionally or by some other means?

5 Why not one meeting during the year devoted to a discussion of the community and civic problems of the city in which most of us live and some of us pay taxes, with members of the civic bodies present to discuss these problems with us?

6 Why not a committee to study out and if possible formulate a feasible plan for the education of the public regarding the difference between the regular practice of medicine and the practice by the cults?

7 If State Legislative matters effecting the profession are looming large, why not bring them before the Society for discussion?

It would seem that these subjects, or some of them, would afford profitable and beneficial study

Respectfully submitted,  
WILBER G FISH, *Secretary*

The following Scientific Program was then presented

"Peculiar Effects of Thyroxin on the Cutaneous System," Dr Sutherland Simpson of Cornell, This was illustrated by lantern slides showing the effect of these experiments upon sheep

"The Effect of Thyroxin upon the Central Nervous System of Thyrorectomized Sheep," H L Liddell, Assistant to Dr Simpson, illustrated with lantern slides

These were practically additions to former papers given earlier in the year, thus bringing results of the experiments up to date

"A Demonstration of the Qualitative and Quantitative Determination of Sugar in Urine," James B Sumner, Professor of Biochemistry in Cornell The demonstration was made upon the urine of a diabetic

"Duplication of Ureter on One or Both Sides in Man," Dr Abram Kerr, Professor of Anatomy in Cornell

Lantern drawings were shown illustrating several cases as discovered upon the dissecting table

Each paper was brief, terse and to the point, interesting and instructive, and each was followed by a short discussion A vote of thanks was given the speakers

It was moved by Dr Coville, seconded by Dr Kerr, that the Society take out a membership in the Ithaca Board of Commerce Motion carried

Dr B F Lockwood of Brookton spoke very feelingly of the aged widow of the late Dr W C Gallagher of Slaterville Springs (a long time member of this Society whose death occurred December 24, 1921, in his 81st year), stating, among other things, that while physically feeble and over 80 years of age, she is still mentally alert and takes a vital interest in things of today, and suggested it would be a fine and courteous thing for this society to call upon her in a body and he felt sure she would be delighted and very appreciative of such attention

It was moved, seconded and carried that a committee be appointed to arrange for such a call upon Mrs Gallagher

The President appointed as such committee Drs B F Lockwood, Edward L Bull and Helen D Bull

Upon motion the meeting adjourned

WILBER G FISH, *Secretary*

## MEDICAL SOCIETY OF ULSTER COUNTY

The Medical Society of Ulster County held its Annual Meeting at the Stuyvesant Hotel, Kingston, December 9, 1924

There was a banquet at 7 30 p m at which the ladies were present

The meeting was called to order at 9 30 p m by the President, Dr Cranston

The minutes of the last meeting were read and approved as read

The following officers were elected for 1925 President, Orlando DuBois Ingalls, Vice-President, Mary-Gage Day, Secretary, Fred H Voss, Treasurer, E E Norwood, Censors Frank L Eastman, Frederick Snyder, Elbert DuBois Loughran, Alfred S Vrooman, Harold L Van Nostrand, Delegate, Luther Emerick, Alternate, John F Larkin

Dr Joseph Lawrence, Executive Officer of the New York State Medical Society, addressed the Society with a few remarks along the following lines

County Society as the medical unit

County Society should have committees to cover every phase of medical work

All physicians fall in one of two classes (1) cooperative, (2) non-cooperative

Physicians are too busy to cooperate, and so

the cultists have an easy time of it and are not usually refuted by County Societies

County Society should be responsible for medical work done in the County

Every meeting or gathering in the County dealing with medical topics should have a representative of the medical organizations present

Secretary should write the Legislators of the County kindly asking them to look after physicians' interests during the coming season, and at the end of the year thank them

Opinions are desired by the State Department as to the working of the Workmen's Compensation Law Suggestions for amendments to it are welcome

County Society should see that men who start practice in the County have the proper qualifications

County Society to furnish medical education for its men by open clinics

Free for physicians of Society

Fee for outsiders

Dr John F Larkin, the Chairman, introduced Dr Philip MacGuire, Post Graduate Hospital, New York City, who spoke on the subject "Acute Abdomen" A general discussion followed

The meeting was closed with an address by the retiring President

## MEDICAL SOCIETY OF THE COUNTY OF FRANKLIN

The regular annual meeting of the Medical Society of the County of Franklin was held at the Elks Club in Malone on Tuesday, November 18, 1924

The business session was called to order at 12 o'clock

Members present Drs F B Trudeau, president, Abbott, Dalphin, MacArtney, Sprague, Stoughton, Van Dyke, Finney, Wardner, Rust, Stamatiades, Kissane, Baldwin, White and Heise

The minutes of the last meeting and the report of the Comitia Minora were read and approved as read

Drs Henry W Leetch and George Eliot Wilson were elected to membership Dr Harold D Sehl, of Burke, was transferred from the Clinton County Society to the Franklin County Society

The following officers were elected for 1925 President, Dr F F Finney, vice-president, Dr John A Farrell, secretary and treasurer, Dr G M Abbott, delegate to the State Medical Society, Dr S F Blanchet, alternate, Dr P F Laphin of Malone, censor for three years, Dr L P Sprague, of Chateaugay

The secretary and treasurer read his reports which, by vote, were accepted as read

Under the head of new business the subject

of changing the date of the annual meeting was taken up, and after considerable discussion an amendment to Section 2, Chapter 9, of our by-laws was offered, to change the date from the second Tuesday of November in each year to the fourth Tuesday of October

The president-elect appointed the following committees Legislation—Dr John E White, Malone, chairman, Dr L P Sprague, Chateaugay, and Dr F B Trudeau, Saranac Lake. Public Health—Dr C C Trembley, Saranac Lake, chairman, Dr W A Wardner, St Regis Falls, and Dr J S Emans, Rainbow Lake

Meeting adjourned for lunch

The scientific session was called to order at 2 o'clock, and the following papers were read and discussed

"Bronchitis, Acute and Chronic," Dr Edward R Baldwin, Saranac Lake

"The Therapeutics of Bone Meal," Dr William N MacArtney, Fort Covington

"The Negative Diagnosis of Pulmonary Tuberculosis," Dr Fred H Heise, Trudeau Sanatorium

"Pulmonary Tuberculosis With Non-acid Fast Tubercle Bacilli in the Sputum," Dr R E Heimbach, Ray Brook Sanatorium

# THE DAILY PRESS

The Christmas Seal sale is the principal health subject which is found among our Daily Press clippings for December. Over half of our clippings are on that subject. They have come from thirty cities in New York State, and doubtless more than that number have been overlooked.

Some of the newspapers stress the local needs of the community. The *Binghamton Press*, December 3rd, states that there are 89 annual deaths in Broome County from tuberculosis, and that the number of living cases is nine times that number. Other newspapers lay stress on the work accomplished with the Christmas Seal money during the last year. The *Hudson Star*, November 26, states that the Committee plans to sell \$3,452.77 worth of Christmas Seals this year, and we presume that approximately that value of seals was sold last year. The activities conducted by the expenditure of this money included occupational therapy, clinics, relief of poor cases of tuberculosis, and the employment of a paid secretary. It would seem that the amount to be raised would be spread rather thin if it covers all these activities.

The *Catskill Mail*, December 1st, has an article complaining of the lack of public interest in the sale of Christmas Seals. Apparently the Chairman of the Greene County Tuberculosis Committee ascribes the public indifference to a belief that the money is used for work outside of the local county. He argues "Surely Catskill and Greene County, whose prosperity so largely depend on health resort reputation, cannot afford to shirk this manifest duty (to buy Christmas seals)."

In all the accounts of the Christmas Seal sale, we saw no reference to a county sanatorium, or to the tuberculosis work that is done as an official activity of a county. Some of the results ascribed to the activity of the unofficial committee were in fact accomplished by the sanatorium superintendents and the official county nurses. While the lay committees of many cities and counties have done excellent work, yet the unsung accomplishments of the official sanatoriums have probably exceeded the amount of work done by the tuberculosis committees. (See this Journal, December, 1924, page 1024.)

The clippings on Christmas Seal sales have failed to disclose a single reference to the periodic health examination campaign which is being promoted by the State Tuberculosis Committee as one of the important activities of the county tuberculosis committees. The advertising and publicity matter in promoting the sales mention only direct tuberculosis work, yet 12 per cent of the money received goes to the State Tuberculosis

Committee, and a large proportion of that percentage goes to promote work which has no direct bearing on the suppression of tuberculosis.

The clippings from the newspapers of Middletown have exceeded those of any other city in the State. Credit for this is probably due to the Health Officer, Dr. H. J. Shelley, who seems to have a proper sense of the value of newspaper publicity. Among the health topics which are mentioned in the items are sewage disposal, Health Department activities, low water in the city reservoir, Mothers' Helpers activities, infant mortality, the medical examination of food handlers, and the winning fight for compliance with health regulations by a large baking company, children's clinics, and infantile paralysis reconstruction work. The Health Department of Middletown is evidently doing excellent work, and is taking pains to inform the people about the health activities in which they are interested.

An epidemic form of plague among live poultry is described in several newspapers of New York City, and has led to an embargo on the shipment of live fowl into the city, although dressed poultry may still be sent into the city. According to the *New York Journal*, December 17th, a committee of Four Borough Poultry Dealers' Association has made public the serious charge that "bootleg" poultry is being brought into the city. The counsel for the Association is quoted as saying:

"By the term 'bootleg' poultry he meant dressed poultry which had died from the prevalent chicken disease, but which was being dressed after death, rushed into the New York market by motor trucks from neighboring states and here offered for sale as 'dressed poultry'."

"'Bootleg' poultry is being brought in by motor trucks from neighboring states, most of which is affected by the plague. Plagued and diseased poultry are being dressed after death from the disease and sold as dressed poultry."

"What is the effect upon the eating public from eating such diseased and plagued poultry? Surely it must be harmful."

The *New York Times*, December 19th, has the headlines "Two More States Put a Ban on Chickens. New Jersey and Connecticut Embargo Shipments from All Parts of the Country—53,343 Pounds Destroyed. Two Carloads of Infected Fowl Reach Jersey Terminal. Scouts Danger to Health."

The newspapers say that the nature and cause

of the disease has not been divulged, and probably is not known. The condition is serious from an economic point of view, and may be grave from a health standpoint.

The New York City Department of Health has an epidemic of typhoid fever to deal with. An excess of cases are also reported in the commuting area around the city. The *New York Times*, December 16th, says

"At the request of Dr. Frank J. Monaghan, Commissioner of the Department of Health of New York, the Board of Estimate appropriated yesterday a special fund of \$50,000 which is to be used for the joint purpose of preventing an increase in the number of typhoid cases here and for the enforcement of the embargo against the shipment to New York of chickens suffering from the European pest.

"Dr. Monaghan said that there were about 350 cases of typhoid under treatment and that they were scattered through all five of the city's boroughs. Sixteen new cases were reported on Sunday and twelve yesterday, as compared with three on the corresponding date of last year.

"A very large number of these cases now in New York have been brought into the city after inoculation from some source of infection outside. I am inclined to believe that automobile touring and the assembling together of great masses of pleasure seekers in the athletic fields and stadia incidental to the autumn football season are accountable for a large proportion of the typhoid cases both here and in Chicago.

"These many thousands of pleasure-seeking spectators came together from many cities, hosts of them going and coming in automobile pleasure parties, eating more or less indiscreetly along the way, drinking probably from creeks and springs and wells along the road without paying much attention to the purity of the water."

The newspaper reports suggest oysters as the cause of the outbreak. The *New York Herald*, December 18th, says

"The embargo action took the form of a warning for New Yorkers to abstain from eating uncooked shellfish, and the exclusion of oysters, clams and mussels from lower New York Bay, Raritan Bay, Sandy Hook Bay, Princess Bay and their tributary waters.

"Steps will be taken today, the Commissioner said, to make this exclusion order a strict embargo, and a guard will be set over docks at which shellfish are discharged.

"I know that this order will cause some disturbance," he added, "but it must be in force until we can definitely ascertain the source of the typhoid infection. Up to the present we have only the histories of a number of patients indicating that shellfish was consumed by them during the period of incubation, but as a precautionary

measure, I am advising the public to abstain, for the time being, from eating uncooked oysters, clams or mussels."

We have failed to find any newspaper reference to preventive inoculations against typhoid, although the present typhoid outbreak gives an excellent opportunity for publicity of the vaccines.

Epidemics of hiccoughs have been reported in several sections of the State, and the outbreak of epidemic encephalitis is discussed in several newspapers. The *Utica Observer Dispatch*, December 11, says

"In order that epidemics of hiccough in several parts of the state may be subjected to a thorough study, Dr. Matthias Nicoll, Jr., state commissioner of health, has directed physicians to report full details of fatal cases.

"Dr. Nicoll says that although there is nothing alarming in the situation the matter was fully considered at a recent meeting of the Public Health Council.

"Dr. Simon Flexner, chairman of the Public Health Council and director of the laboratories of the Rockefeller Institute for Medical Research, gave out the following statement following the meeting of the council:

"Epidemics of hiccough have at times coincided with or followed in the wake of outbreaks of epidemic encephalitis. They are in some way connected."

The Chlorine Gas treatment of colds is discussed by several newspapers, especially by the press of New York City. An editorial in the *New York Herald*, December 2nd, says

#### "DEFIANT SNEEZES"

"Possibly the chlorine gas treatment for colds in the head as administered by the Chemical Warfare Service has a militant quality lacking in civilian clinics. It is hard to account for the failure of the New York Health Department 'inhalatoriums' to cure colds, in view of the almost uniform success reported by the army physicians in Washington.

"The chlorine offensive came to New York with splendid indorsements. Its fumes banished a cough for Secretary Weeks. President Coolidge then put a cold to rout by a gentle inhalation. It helped a score of Senators and Representatives to quiet breathing. Perhaps colds along the Hudson are more stubborn than the Potomac variety. At any rate, this city's Health Department, after a painstaking trial of two months, has found little or no beneficial effects from the gas remedy. The diverse results in Washington and New York add a new puzzle to an old mystery."

# BOOK REVIEWS

**HIGH BLOOD PRESSURE, ITS VARIATIONS AND CONTROL.** A Manual for Practitioners By J F HALLS DALLY, M A, M D, B C, Cantab, M R C P, Lond. Physician to the Mount Vernon Hospital for Tuberculosis and Diseases of the Heart and Lungs, Senior Physician to the St. Marylebone General Dispensary William Wood and Company, New York, 1924 Price, \$3.25

This is a readable book covering the various phases of the subject. The technique of estimation of blood pressure is described in detail. The importance of the diastolic pressure is stressed and the author believes that it should be read at the point where the dull tone first appears and not at the point of disappearance of all sound. He states that the period from the first appearance of the dull tone to the absence of all sound varies from 3 to 55 M M. The hyperpiesia of Clifford Allbutt and the different types of arterio-sclerosis are discussed.

In considering the dietetic treatment of hypertension, the writer states that "although there is no absolute agreement as to the influence of protein foodstuffs on arterial pressure, all the most recent work goes to prove that arterial pressure is not raised by the ingestion of proteins." This is true, as the proponents of a very low protein diet have very little real evidence to bear out their views. Excess of the total food seems to be more harmful than a moderate amount of protein in a well balanced diet. The value of mental and physical rest in conjunction with a low diet, when pressure is very high, is emphasized.

Among the drugs, the author has faith in the efficacy of benzyl benzoate, and thinks that headache, giddiness, numbness and vascular pains are relieved by it.

One of the best parts of the book is the carefully arranged bibliography which comprises one hundred and ninety references, many of them to standard American journals.

W E. McCOLLOM

**OBSTETRICS FOR NURSES** By JOSEPH D DeLEE, A M, M D. Seventh Edition, entirely reset 12mo of 621 pages, illustrated Phila. & London, W B Saunders Co, 1924 Cloth, \$3.00

DeLee's work is so well known in America that a review of this book need be but brief and explicit. It is one of the best, as it follows the usual high standard that DeLee maintains.

G W P

**MEDICAL AND SANITARY INSPECTION OF SCHOOLS** For the Health Officer, the Physician, the Nurse and the Teacher By S W NEWMAYER, A B, M D (Second Edition) 12mo of 462 pages with 79 illustrations and 6 plates Phila. & New York, Lea and Febiger, 1924 Cloth, \$4.00

This is a complete handbook on Medical School Inspection for the use of ordinary physicians and nurses who are called upon to do medical inspections of school children. It covers the broad topics of Administration, Records, Sanitation of the Building, Communicable Diseases, Physical Defects, Teachers' Health, and Mental Tests and Standards, and it gives an outline of each subdivision. It is well illustrated with photographs, and is written in a clear, concise style. It emphasizes the details of how to do things, and considers the practical points which an ordinary physician must decide. For example, it gives detailed plans of a simple boys' toilet for a small rural school.

A physician or nurse desiring to prepare to do medical inspection work in schools will find that the book will be a satisfactory guide to all phases of the work.

**THE HOSPITAL SITUATION IN GREATER NEW YORK** Report of a Survey of Hospitals in New York City by the Public Health Committee of the New York Academy of Medicine. Prepared by E H LEWINSKI-CORWIN, Ph.D., Executive Secretary Illustrations G P Putnam's Sons, New York, 1924

Books that are of value to the doctor interested in the problems of hospital organization are very few indeed. Dr Corwin's book is a distinct contribution. The survey of hospital facilities in New York City is very complete, and the chapters on hospital administration and finance are very valuable and easily read. Of particular interest to the doctor is the analysis of hospital records of several New York hospitals. Over twelve hundred records were selected at random from twenty one general and eleven special hospitals and critically dissected. The results are astonishing, and of tremendous interest. This chapter might well be read by every doctor who takes care of his patients in a hospital. More of this kind of work is needed. Scant space is devoted to a study of organized teaching, and the extra mural undergraduate instruction of the Long Island College Hospital Medical College is ignored. The Brooklyn Extension Plan and the Practical Lecture Series which are being closely watched everywhere are hardly mentioned. It may be that Brooklyn overrates the importance of her educational plans, but the success of the movement has been instantaneous. The book on the whole is one that no hospital man can afford to be without, and it might well be read with profit all over the country.

C A G

**SYNOPSIS OF MIDWIFERY** By A. C. MAGIAN, M D 12mo of 245 pages London, William Heinemann, Ltd., 1923 Cloth, 8 shillings 6 pence.

This small book is an excellent synopsis of the leading facts and principles of treatment in Obstetrics.

There is little of the new, or bizarre, that is presented, but on the other hand, the author clings to those well established methods which time has proven the worth of, and which we deem to call, conservative.

In a book of this size, little opportunity is afforded for the discussion of various theories and methods, but the author has selected those theories and methods, which time and experience has established, as being most practical.

In conclusion, the reviewer feels that this small book can be recommended as a safe and sane synopsis of midwifery.

G W P

**INTERNATIONAL CLINICS** By leading members of the Medical Profession throughout the world Vol II Thirty-fourth Series, 1924 J B Lippincott Co, 1924, Phila., Pa.

This volume includes a number of excellent articles. The first article on a new technic for intranasal diseases opens a new field for diathermy and the report seems to show results. The article on mechanical vibration in cardiovascular conditions seems to report the results of an enthusiast, but are worthy of consideration and examination into the permanent results of this treatment. Dorland's article on the influence of X-rays and allied substances on living tissues is a carefully prepared study and shows most extensive research into the literature of the subject. It is difficult to comment on individual articles as the standard of all the papers is excellent. Ashhurst's lecture on osteomyelitis is timely and thorough. Pepper's article on Metastasis is most interesting and gives a good discussion on the action of tumors in the body. The general excellence of this volume continues the high standard of this publication.

# BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from these columns will be made for review, as dictated by their merits, or in the interest of our readers.

- MEDICAL CLINICS OF NORTH AMERICA** Volume 8, Number 1, July 1924 (New York Number) Published every other month by the W B Saunders Company, Phila and London Per Clinic Year (6 issues) Cloth, \$16 00 net, paper, \$12 00 net
- BASAL METABOLISM** Determination of the Metabolic Rate in the Practice of Medicine By JOHN T KING, JR., M D Octavo of 118 pages Baltimore, Williams & Wilkins Company, 1924 Cloth, \$2 50
- SURGICAL CLINICS OF NORTH AMERICA** Volume 4, No 3, June 1924 (Chicago Number) Published every other month by the W B Saunders Company, Phila and London Per Clinic Year (6 issues) Cloth, \$16 00 net, paper, \$12 00 net
- THE PRINCIPLES AND PRACTICE OF OBSTETRICS** By JOSEPH B DeLEE, A M, M D Fourth Edition, thoroughly revised. Large octavo of 1123 pages with 1128 illustrations Phila and London, W B Saunders Company, 1924 Cloth, \$12 00
- MEDICAL GYNECOLOGY** By SAMUEL WYLLIS BANDLER, M D Fourth Edition, thoroughly revised Octavo of 930 pages with 157 original illustrations Phila and London, W B Saunders Company Cloth, \$8 00
- ANGINA PECTORIS** By SIR JAMES MACKENZIE, M D, LL D Large Octavo of 253 pages, illustrated London, Henry Frowde & Holder & Stoughton, New York, Oxford University Press, 1923 Cloth, \$9 00 (Oxford Medical Publications)
- GONORRHOEA** By DAVID THOMSON, O B E, M B Large Octavo of 519 pages with illustrations and plates Oxford University Press, 1923 Cloth, \$12 75 (Oxford Medical Publications)
- CHRONIC INTESTINAL STASIS (ARBUTHNOT LANE'S DISEASE) A Radiological Study** By ALFRED C JORDAN, M D Large octavo of 230 pages with 314 illustrations New York, Oxford University Press, 1923 Cloth, \$7 50 (Oxford Medical Publications)
- DISEASES OF THE MALE ORGANS OF GENERATION** By KENNETH M WALKER, M A, M B BC Octavo of 234 pages illustrated. New York Oxford University Press, 1923 Cloth, \$4 00 (Oxford Medical Publications)
- NEW VIEWS ON DIABETES MELITUS** By P J CAMMIDGE, M D, and H A H HOWARD, B Sc. Octavo of 611 pages, illustrated Oxford University Press, 1923 Cloth, \$6 50 (Oxford Medical Publications)
- THE PATHOLOGY AND TREATMENT OF DIABETES MELLITUS** By GEORGE GRAHAM, M A, M D 12mo of 188 pages New York, Oxford University Press, 1923 Cloth, \$2 00 (Oxford Medical Publications)
- SURGICAL CLINICS OF NORTH AMERICA** Volume 4, No 4, August, 1924 (Cleveland Clinic Number) Published every other month by the W B Saunders Company, Phila and London Per Clinic Year (6 issues), Cloth, \$16 00 net, paper, \$12 00 net
- DEVELOPMENTAL ANATOMY** A Text-Book and Laboratory Manual of Embryology By LESLIE BRAINERD AREY, Prof of Anatomy, Northwestern University Medical School, Chicago Octavo 433 pages, 419 illustrations Phila and London, W B Saunders Company, 1924 Cloth, \$5 50
- ESSENTIALS OF PRESCRIPTION WRITING** By CARY EGGLESTON, M D Third Edition, revised 146 pages. Phila and London, W B Saunders Co, 1924 Cloth, \$1 50
- MANUAL OF DISEASES OF THE NOSE, THROAT AND EAR.** By E B GLEASON M D, LL D Fifth Edition, thoroughly revised 12mo of 660 pages, with 212 illustrations Phila and London, W B Saunders Company, 1924 Cloth, \$4 00
- HUMAN CONSTITUTION A CONSIDERATION OF ITS RELATIONSHIP TO DISEASE** By GEORGE DRAPER, M D Octavo of 345 pages with 208 illustrations and 105 tables Phila and London, W B Saunders Company, 1924 Cloth, \$7 50
- OPERATIVE SURGERY** Covering the Operative Technic Involved in the Operations of General and Special Surgerv By WARREN STONE BICKHAM, M D, F A C S Vol 5 Octavo of 880 pages with 1118 illustrations Phila and London, W B Saunders Company, 1924 Cloth, \$10 00 per volume. Sold by subscription only (To be complete in six volumes with desk index)
- PATHOGENIC MICROORGANISMS A Practical Manual for Students, Physicians and Health Officers** By WILLIAM HALLOCH PARK, M D, ANNA WESSELS WILLIAMS, M D, and CHARLES KRUMWIEDE, M D Eighth Edition, enlarged and thoroughly revised Octavo 811, 211 engravings and 9 full-page plates Phila and New York, Lea & Febiger, 1924 Cloth, \$6.50
- BASAL METABOLISM IN HEALTH AND DISEASE.** By EUGENE F DuBois, M D Octavo of 372 pages, illustrated with 79 engravings Phila and New York, Lea & Febiger, 1924 Cloth, \$4 75
- OUTLINES OF INTERNAL MEDICINE FOR THE USE OF NURSES AND JUNIOR MEDICAL STUDENTS** By CLIFFORD BAILEY FARR, A M, M D Fourth and revised edition. 12mo of 377 pages, with 69 illustrations and 6 plates Phila and New York, Lea & Febiger, 1924 Cloth, \$2 75
- MODERN METHODS IN THE DIAGNOSIS AND TREATMENT OF RENAL DISEASE.** By HUGH MACLEAN M D, D Sc. Second Edition, revised and enlarged Octavo of 110 pages, with four colored plates Phila and New York, Lea & Febiger, 1924 Cloth, \$2 50
- ANATOMY OF THE HUMAN BODY** By HENRY GRAY FRS Twenty-first Edition, thoroughly revised and re-edited by WARREN H LEWIS B S, M D Octavo of 1417 pages with 1283 illustrations Phila and New York, Lea & Febiger, 1924 Cloth, \$10 00
- ABT'S PEDIATRICS** by 150 Specialists Edited by ISAAC A ABT, M D Volume 4, containing 1271 pages with 271 illustrations (Set to be complete in eight octavo volumes) Phila and London, W B Saunders Company, 1924 Cloth, \$10 00 per volume Sold by subscription
- LECTURES ON PATHOLOGY** (Delivered in the United States, 1924) By Ludwig Aschoff M D, Professor Pathologic Anatomy, University Freiburg Thirty-five illustrations Paul B Hoeber, Inc, New York, 1924 Price, \$5 00
- ANESTHESIA FOR NURSES** By Colonel William Webster, D S O, M D, C M Professor Anesthesiology, University of Manitoba Medical School Illustrated The C V Mosby Co, St Louis 1924 Price, \$2 00
- A TREATISE ON INFLUENZA**, with special reference to the Pandemic of 1918 By Rajendra Kumar Sen, Medical Officer, Hurmatty Tea Co, Ltd, Assam John Bale, Sons & Danielsson, Ltd, Oxford House, London, W I

# NEW YORK STATE JOURNAL of MEDICINE

PUBLISHED BY THE MEDICAL SOCIETY OF THE STATE OF NEW YORK

VOL. 25, No 2

NEW YORK, N. Y.

JANUARY 23, 1925

## THE LOW CERVICAL CESAREAN SECTION—ITS ADVANTAGES\*

By J. K. QUIGLEY, M.D., F.A.C.S.,

ROCHESTER, N. Y.

THE performance of the classical Cesarean section upon patients in labor who have been subjected to vaginal examinations through an unclean field (unshaven pubes, sometimes unscrubbed) by an attendant of questionable or unquestionable aseptic technic, sometimes hours after rupture of the membranes has been attended by a high morbidity and relatively high mortality. These cases are potentially infected and while many patients so handled do after a spontaneous delivery exhibit little or no evidence of puerperal sepsis nevertheless they are not good risks for abdominal delivery.

This left the choice of operation in cases of disproportion, between a Cesarean section followed by hysterectomy, the Porro operation, pubiotomy or symphysiotomy and craniotomy on the living child. The first of these is often safe but sacrifices the uterus, the second is not free from mortality in infected cases to say nothing of the objections to division of the pelvic girdle such as operative hemorrhage, injury to the bladder and difficult locomotion afterward. The third or last mentioned is too horrible to contemplate unless all other avenues are closed.

To overcome this shortcoming of abdominal delivery Frank of Cologne in 1907 proposed the extra peritoneal operation of which the Kuestner is a type. By this operation the uterus is reached in its lower segment laterally over Poupart's ligament and opened without invasion of the general peritoneal cavity. In the type of case under discussion good results have been obtained by this method in several series of cases. Kuestner reported 200 cases with only two deaths, 56 of these were so-called doubtful or infected cases. Markoe and McPherson of the New York Lying-In Hospital described their operation a Kuestner technic plus Carrel-Dakin after-treatment, their results were good.

However this procedure has several objections

First, its technical difficulty. Troublesome hemorrhage has been encountered in opening the uterus low and laterally, difficulty has been experienced in extraction of the child resulting in foetal death. Döderlein and Kuestner reported ten foetal deaths in 279 extra peritoneal operations, while in 274 transperitoneal sections performed by Franz, Bausch, Hofmeier and Fehling only two children were lost—a foetal mortality one-fifth as high. Because of adhesions its repetition is difficult or impossible, in addition there is danger of injury to the bladder or ureter. In 200 cases of extra-peritoneal operations in Kuestner's clinic there were two ureteral and one vesicocervical fistula. There is the possibility of opening into the peritoneal cavity thus defeating the object sought and according to Rohrbach six to eight per cent of these patients develop hernia.

At the last meeting of the American Association of Obstetricians and Gynecologists Dr. Asa B. Davis of New York presented a paper on extraperitoneal Cesarean section on supposedly infected cases all of which ran a high temperature post operative, his results were two deaths in twenty-eight cases operated, general peritonitis being responsible for one and pneumonia for the second. There were three still births, though the foetal heart was heard in all immediately before operation, and four neonatal deaths. I wish to quote from Dr. Davis' paper—"All of these cases had high temperatures after operation—In no case was it possible to secure primary-union of the abdominal wound—In twenty-one cases part or the whole length of the wound separated down to the aponeurosis, in four cases the whole depth of the wound broke down with considerable sloughing—The operation is physically and technically a very difficult one to perform. In early cases I spent something over two hours." There was one urinary fistula and in several of Dr. Davis' early operations the uterine artery was torn across by an extension of the wound. My object in quoting so extensively from Dr. Davis

\*Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester April 22 1924

**A DIABETIC MANUAL FOR THE MUTUAL USE OF DOCTOR AND PATIENT** By ELLIOTT P. JOSLIN, M.D. Third Edition, thoroughly revised. Illustrated. Phila. and New York, Lea & Febiger, 1924. Cloth, \$2.00

The most time consuming and tedious part of caring for diabetics is undoubtedly the education of these patients, and it is at the same time, the most important service a doctor has to do. Doctor Joslin's Manual is admirably conceived for this purpose, and the endless number of necessary details are presented in a simple and masterly manner.

He discusses for the laity, the mechanism and cause of the disease, and gives the facts about insulin, its discovery, its use, the signs of an over-dose, and the procedures to be followed in such a case. In a series of questions and answers, he tells in simple language, what the diabetic should know, and it is noteworthy that for the milder cases he expects them to be able to arrange their daily food-intake, without the use of scales. His presentation of the arithmetic, the food values, and the balancing of fat, carbohydrate and protein, is made very plain and simplified, by telling illustrations and charts. Particularly he emphasizes the information the patient himself may obtain by urine examination, and indicates how he may better distribute his food during the day, or balance his food and insulin.

The weight charts, the emphasis on the hygiene of the diabetic, the care of the teeth, skin and feet, and the dietetic suggestions, recipes, and menus, are largely the same as in his larger volume, and it is these very details which have prompted us to recommend the larger volume to patients.

In these 203 pages there is sufficient information in a compact and convenient form for the physician, and for the patient it is undoubtedly one of the best manuals which have been offered.

LOUIS C. JOHNSON

**BACTERIOLOGY** A study of Microorganisms and Their Relation to Human Welfare. By H. W. CONN, Ph.D., and HAROLD J. CONN, Ph.D. Second Edition. Octavo of 449 pages, illustrated. Baltimore, Williams & Wilkins Co., 1924. Cloth, \$4.00

This is a text-book on general bacteriology, only a portion of which is devoted to the group of organisms pathogenic to man. Although designed as an introduction to the subject for college students, which purpose it admirably fulfills, the medical reader will find it both interesting and instructive. So much attention is focussed upon the pathogenic bacteria, that there is need for such a book as this to call attention to the vitally important rôle played by bacteria in agriculture and industry.

Part 1 deals with the history of bacteriology, which is well told, and general facts about bacteria. Part 2 deals with the bacteria in agriculture and industry. Part 3 with pathogenic bacteria. The authors have stressed general principles and left technical details to other writers, which makes this a particularly readable book for layman and physician alike.

E. B. SMITH

**ANESTHESIA** By JAMES TAYLOR GWATHMEY, M.D., with collaborators on special subjects. Second Revised Edition. The Macmillan Co., New York, 1924. Mirabile dictu! Here is a revision of a ten year old book containing nearly 150 pages less than the original. Truly, the author had a sensible appreciation of comparative values when he substituted up-to-date material for that which had become of only historical interest. To be sure we now have to look for the omitted agents

in a real chemistry—they belonged there anyway in the first place.

The first half of the book remains "as was." The very interesting new matter comprises mainly the author's own researches into colonic anesthesia, and a restatement of the principles of the synergism of agents, and a valuable contribution to our knowledge of their combinations. Colonic anesthesia is advocated for obstetric needs. The more recent reports of its successful use at the N. Y. Lying-in Hospital and the noteworthy demonstrations at a recent session of the Eastern Society of Anesthetists are clear indications of its probably wide acceptance as a substitute for older methods.

Whether the revision of the section on topical anesthesia had added much to its value for the general anesthetist is a matter of opinion. As a matter of fact this field is so uniformly left to the operating surgeon, and the matter is so well treated in its own literature, that there seems hardly place for it in this book except as an item of related interest.

The medico-legal status of the anesthetist is receiving, in these days, well-merited consideration. Much has been added to the subject during the past ten years, hence it may be regretted that the chapter was not brought up to date—anesthetists think hard about the illegal practice of employing nurses, for instance. It would have made interesting reading if Mr. Crim had made a careful study of that vexed question.

There is an index of 36 pages and a list of authors cited, containing about 800 names. No wonder a surgeon said, after looking through these 800 pages, "I had no idea there was so much to anesthesia." We are all glad to see this new edition.

A. F. E.

**THE RELATIVE POSITION OF REST OF THE EYES AND THE PROLONGED OCCLUSION TEST** By F. W. MARLOW, M.D., M.R.C.S., Eng. F.A.C.S., Professor Ophthalmology, College of Medicine, Syracuse University. Illustrated with original diagrams and charts. F. A. Davis Co., Philadelphia, 1924. Price \$2.50 net.

In this monograph the author describes at greater length and with more insistent attention a method which he has used for years and which he has written about before. The basis of the article is an analysis of 700 cases examined by his method, with plates of results obtained, classified under the various phorias. There are also charts of several especially interesting or illustrative cases.

It is interesting to see the often marked changes which take place in the muscle imbalances under the influence of the prolonged occlusion of one eye,—apparent esophoria becoming an exophoria, right hyperphoria becoming a left hyperphoria, etc.

The author conclusively demonstrates that he has found a means of relieving some of those stubborn cases of asthenopia heretofore untouched by correcting merely the refractive error.

E. CLIFFORD PLACE.

**HYGIENE AND PUBLIC HEALTH** By GEORGE M. PRICE, M.D. Third Edition, thoroughly revised. 12mo of 306 pages. Phila. and New York, Lea & Febiger, 1924. Cloth, \$2.25.

This is an epitome of the most important essentials of public health work. The author presents his material in a concise and assertive style and at the end of each chapter he gives a list of questions pertaining to the preceding text.

Students in elementary courses in public health work will find this book of immense value.

E. H. M.

The danger of peritonitis in infected cases in the classical section comes not from the amniotic spill at the time of operation but from the escape of infective lochia through the incision. The site of operation is through the thick contractile portion of the uterus and the sutures are necessarily tight to secure hemostasis thus raising the possibility of necrosis, in addition the incision is subjected to the alternate contraction and relaxation of the uterus during the first few days of its healing process. In the low cervical site the sutures need not be as tight and are in a relatively immobile field. The chief advantage in the Kroenig Beck operation comes from the sealing off from the general peritoneal cavity the cervico uterine incision, for, a few hours after the operation the two overlapping layers of peritoneum are united and should intra-uterine infection spread it would localize itself under this flap posterior to the bladder and drain either through the cervix, point towards the skin or be easily opened by an anterior colpotomy—while seepage of bacteria-laden lochia between the sutures of a fundal incision infects the general peritoneal cavity.

Again the post operative discomfort is reduced to a minimum probably due largely to the absence of exposure or handling of bowel and other viscera, the condition of these patients for the first few days after operation compared to the classical section is often surprising. There is less vomiting, many times none, distention is slight and relieved by the first high enema, shock is notable by its absence and the general picture is usually better than that following a difficult forceps delivery. In addition the fundus can be palpated above the line of incision, watched and stimulated if necessary for bleeding. DeLee has called attention to the advantage in the site of the incision in the cervix which stands infection better than the body of the uterus because it is used to it, also the lower abdomen is more resistant to infection.

There are few or no adhesions which may follow so-called clean classical sections. Abdominal hernia is less liable to occur. There is less operative hemorrhage.

What of the liability to uterine rupture—does a scar in this location possess a greater or less liability to rupture during a subsequent pregnancy or labor than one through the fundus where it is pretty well established that the chance is one in twenty-five or 4 per cent? Little has been written upon this important phase of the subject and it is this lack of knowledge as to future pregnancies that deters me from choosing this type of operation for the elective section. What data there is available is favorable to the low operation. There are only two cases on record of the rupture of a scar in this location during a later pregnancy. Phaneuf gives his results in six sec-

ondary operations and in "none of these cases were there any weak points in the scar and it was almost impossible to distinguish a scar as such." Gaifami, a French operator, repeated the section in eleven cases and the cicatrix was firm in all. Four of DeLee's first 145 cases were delivered by a second low cervical section and the "scar could hardly be found." DeLee is doing most of his Cesarean section through this route today, and Vogt of Berlin believes it makes the classical operation obsolete.

A comparison of mortality rates for the classical section and the newer procedure shows a distinct advantage for the low operation.

De Lee's 233 cases with one death, or less than one-half of 1 per cent as against 100 cases of the classical section done by the same operator with a mortality of 6 per cent and Holmes' series of ninety-two classical sections with six deaths. King of New Orleans with admirable frankness reported 117 classical Cesarean sections. Seventy-six women recovered, twenty-five died from the disease for which the operation was performed, such as eclampsia, bad heart lesions, etc., and twelve died from peritonitis, two from sepsis and two from other operative causes, a total of sixteen operative deaths (13.6%). It is from the improper selection of cases unsuitable for Cesarean section that the operation is injured and will fall into disrepute. It seems almost certain that several of the fourteen in this series dying from peritonitis or sepsis would have recovered had the low two flap cervical section been done. To be sure there have been several series of 100 cases or thereabouts of classical section on well selected cases with no maternal mortality but no operator will always report a zero mortality for this or any other abdominal operation and the mortality for classical section even under the best of circumstances will run between 3 and 5 per cent—while the rate in general on all classes of cases is given between 2.9 and 14 per cent, depending upon the length of labor, number of vaginal examinations and whether the membranes have ruptured and if so how long since, these figures are the result of a compilation by Polak and Beck of 2,200 cases operated in various American clinics.

Holland and Murro Kerr in the British Medical Journal reported 4,000 collected cases operated between 1911 and 1920 and the analysis of this large number of operations confirmed that which has long been believed.

The mortality of those cases

First—Not in labor was	16%
Second—Early in labor	18%
Third—Late in labor	10.7%
Fourth—After induction of labor	14 %
Fifth—After attempts at forceps delivery	27 %

is not to disparage his mortality rate which for this class of case is low, but to emphasize the objections to the extraperitoneal operation, technically difficult, unnecessarily long and beset with many dangers such as severe hemorrhage, vesical fistula, sloughing of the wound and high infant mortality

McGlinn in a paper published in 1920 said

"Theoretically in clean cases the extra peritoneal operation is the ideal operation, but its disadvantages overshadow its advantages. The transperitoneal operation is superior to the classical Cesarean section for the reason that the resulting adhesions are in a situation less likely to give trouble. The Beck operation is superior to the transperitoneal operation, as it has all the advantages of the former and none of its difficulties

"My own feeling is that the Beck operation with thorough protection of the peritoneal cavity and perfect peritonealization of the uterine incision is superior to the transperitoneal operation as a routine procedure. While theoretically it is not as efficient as the extraperitoneal method, practically, on account of the many disadvantages of the latter, it is the better operation"

In the *American Journal of Obstetrics* for February, 1919, Dr Alfred C Beck of Brooklyn published a paper entitled, "Observations on a series of cases of Cesarean section done at the Long Island College Hospital during the past six years" in which Dr Beck described his modification of the Kroenig operation

In 1919 DeLee published a paper, "The newer methods of Cesarean section, Report of Forty Cases." This is a transperitoneal or low cervical operation, a modification of the operation done by Kroenig since 1912. He was closely followed by Barton Cooke Hirst in 1920 who reported thirty infected cases operated by his modification of the Veit-Fromme technic, there were no deaths in this series. In 1921 and 1922 Beck and Polak of Brooklyn, Phaneuf and Hegarty of Boston, DeLee and Cornell of Chicago and Vogt of Berlin reported 397 low cervical operations with a slight variation in technic all on patients in labor and not considered good risks for the classical operation, with a surprisingly low mortality. Last year DeLee published his results in a total of 233 laparotrachelotomies with only one maternal and three foetal deaths. Still later John C Hirst and W W Van Dolsen this year report 107 cases in advanced labor operated by the Kroenig Beck method with two deaths, one from gangrene of the colon from mesenteric embolism and the other from acute dilatation of the heart on the eighteenth day in a patient with chronic myocarditis. At present this operation is known by several more or less descriptive names

Transperitoneal Cesarean Section  
Laparotrachelotomy, DeLee's title

Suprasymphyseal Cesarean Section, used by the Germans

Low Cervical Cesarean section, favored by Polak

There are also four variations in technic

*First*—The Kroenig

The abdomen is opened by a longitudinal incision below the umbilicus, the visceral peritoneum above the bladder reflection, incised and stripped down the bladder is now held back by a suprapubic retractor and the cervix opened longitudinally by a knife and enlarged with blunt scissors for three and a half to four inches, the child is delivered by forceps, the placenta removed and the cervico-uterine incision closed by interrupted chromic catgut. After this the flap of peritoneum attached to the bladder is brought up overlapping the incision in the visceral peritoneum and sutured here with a continuous chromic suture. The abdomen is closed as usual

*Second*—The Beck or two flap operation is a modification of the Kroenig and differs in this respect. After transversely incising the visceral peritoneum one-half to one inch from the bladder the peritoneum is stripped up and down thus forming two flaps and exposing the lower uterine segment and cervix for three and a half to four inches. After the uterus is emptied and sutured the upper flap is tacked down to the uterus by three or four interrupted fine chromic sutures and the lower flap carrying the bladder brought up to overlap the upper by an inch and similarly tacked down, care being taken that none of these interrupted transverse sutures coincides with those closing the vertical sutures in the cervix and lower segment to obviate a possibility of infection from within traveling outward through a suture line

*Third*—DeLee's modification of the Kroenig operation. Here the fascia over the lower uterine segment is sutured burying the cervical incision

*Fourth*—Hirst modification of the Veit-Fromme operation. Sometimes called the transperitoneal method

The abdomen is opened below the umbilicus by a vertical incision, the peritoneum over the uterus is incised vertically and stripped back laterally forming two lateral flaps, the edge of each is united to the edges of the parietal peritoneum by interrupted catgut sutures (some use clamps), this exposes an area of the lower uterine segment and cervix through which a vertical incision is made and the child delivered—after closure of the uterine wound the united parieto-visceral layers of peritoneum are brought together by fine continuous chromic catgut—this leaves the uterine incision at the end of twenty-four hours practically sealed off from the general peritoneal cavity

The operation presented no particular difficulty, hemorrhage was severe in none and below the usual amount encountered in the classical section in all. Some difficulty in the first few cases was experienced in extraction of the head with the forceps and in two or three the children were delivered by the feet, in the later operations the head was delivered manually passing one hand over the pubes beneath the head, elevating it and at the same time employing pressure upon the fundus. The post operative course in two patients (cases one and seven) was somewhat stormy, there was no vomiting, little pain and only moderate distention but the lochia was foul and the temperature as high as 103 for two days. Neither of these patients developed any infection outside the uterus. Two patients vomited once each, four had moderate distention, four little and seven none at all. Three had moderate pain postoperative and in twelve it was absent or slight. One patient had a slight infection of the skin incision. All the patients were discharged in good condition and all the babies, except one, a monstrosity, which died.

#### The routine post operative care

Tap water per rectum, eight ounces every four hours till she is retaining water by mouth.

Morphine if needed for pain.

Fowler position at the end of twenty-four hours.

For bleeding post operative ice bag to fundus, pituitrin and ergot. These two drugs are given only on indication and not as a routine.

High gas enema on the second day, if this is followed by a result, liquid food is allowed.

No douches either as a routine or for foul lochia.

No cathartics as a routine.

No dressing of wound routinely until ninth or tenth day when sutures are removed and patient is allowed to sit out of bed on the twelfth day, they are discharged fourteen to eighteen days post operative.

#### Conclusions

The low cervical Cesarean section has two fields of usefulness.

First, for the case where because of length of labor, frequent examinations, ruptured membranes or induction of labor, one would hesitate to do a classical section.

Second, it permits of a test of labor in the border line pelvis and because of this many cases can be safely delivered per vaginam which other-

wise might be subjected to a classical Cesarean section early in labor.

It is not claimed that by the employment of this technic all infection is obviated, it will not prevent intrauterine infection—bacteremia, extension through lymphatic channels or embolic processes but it does in the vast majority of cases prevent the development of general peritonitis which is by far the most frequent cause of death following Cesarean section done by the classical method.

An interesting study was made by J W Harris of Johns Hopkins upon sixty-four uteri removed in doing 223 Cesarean sections, these were Porro operations done either to effect sterilization or because of frank or suspected infection at the time of operation. Sixty of these were subjected to histo-pathological study. Of these sixty cases the uterus was removed from twenty-eight late in the first stage or during the second stage of labor and eighteen showed definite evidence of ascending infection in the form of leucocytic infiltration in the mucosa and in some bacteria were demonstrated. In the twenty-seven uteri removed from patients at an elected time or within six hours after the onset of labor signs of infection were found in only one.

Contra indications to the low cervical Cesarean section. If local anesthesia is desirable or necessary the upper incision is preferable. Placenta praevia has been given as a contra indication though some operators do not make it an exception.

In the very obese the technical difficulties in the clean case will probably outweigh the advantages.

If great haste were necessary as in cardiac decompensation in the mother, premature separation of the placenta or threatened foetal asphyxia the classical operation offers the best chance.

During the past three years I have done fifteen low cervical Cesarean sections all by the Beck modification of the Kroenig technic. There were ten primiparae, five multipara. Seven of these cases were seen in consultation, four ward cases treated in the course of a service at the Rochester General Hospital and the remaining four were private cases. Only one patient was not in labor and could be considered an elective clean case. Fourteen were in labor from five hours to four days, in six, labor had been in progress over twenty-four hours, seven had had from one to five vaginal examinations, some of them by the ungloved hand through an unprepared vulva, in five the membranes had ruptured. In short fourteen cases because either of duration of labor, rupture of the membranes, vaginal examinations or a combination of these factors were far from good risks for the classical operation.

The indications were as follows

Flat pelvis	9
Justo minor pelvis	3
Face posterior presentation, post mature child allowed test of labor	1
Elderly primipara, large baby, test of labor	1
Disproportion, ten pound fourteen ounce baby, test of labor (lost first baby from difficult delivery)	1

Two had had a previous classical section for flat and justo minor pelvis respectively (cases four and ten)

These two drawings show the difference in action of the two types of tubes

2 That the pump should be under complete control and give the desired degree of vacuum in the tube but within limits of safety to the tissues Unless the pump is strong enough to give a considerable degree of vacuum it will be found that conditions will be met where this lack of power on the part of the pump will be a handicap to its usefulness At the same time each stroke of the pump must not be of too great force or a distinct trauma may be inflicted Even with the pump that I use daily I have been surprised by its effect in some cases and have learned to watch it in new cases before giving what is considered an ordinary treatment With a good strong pump repeated tractions on the piston will give any degree of stimulation that is wise to apply to the structure involved

3 The third requirement was an easy breaking of the vacuum To procure this I inserted an air valve midway between the pump and the cup This has proved a most satisfactory method of breaking the partial vacuum

In order to make clear the use and application of aspiratory hyperemia as a method of treatment I will describe the instrument more in detail than in either of my former papers, and give as clearly as I may the indications for

its use, practical points in its application and method of recording findings The instrument consists of an air pump, two pieces of rubber tubing, an air vent, and a set of glass tubes of various sizes and shapes

The air pump is of the ordinary type with a barrel  $10\frac{1}{2}$  c.m long, 13 c.m in circumference, the stroke is 8 c.m, the capacity of the air chamber is  $93\frac{2}{3}$  c.c, this gives one stroke of the piston an exhaust capacity of one volume of

air in number 4 tube,  $1\frac{1}{3}$  in numbers 1 and 2, and 3 in numbers 10, 11, and 12

So if the tube is accurately placed and all the joints, the piston, and the valves are air-tight, the degree of vacuum may be graduated by the number of strokes, allowing for the elasticity of the tissues and the size of the tube

The desired degree of vacuum when obtained, is held by the valves in the pump until freed by opening the air vent

The rubber tubing should be thick-walled ( $\frac{1}{4}$  c.m) with a calibre of  $\frac{1}{2}$  c.m, that is 1 c.m in diameter, a convenient length for the first tubing, that which connects the pump to the air vent is 18 c.m, that of the second, which connects the air vent to the glass tube 27 c.m

The glass tubes, taking number 4 as an example, are 20 c.m long in the shaft, which is 8 c.m in circumference, the application end is slightly belled to 9 c.m in circumference for closer fitting to the cervix, the outer end drawn for attachment to the rubber tubing

Number 4 tube is the one most aptly designed for general use in the type of cases that most frequently require this method of treatment

This instrument, in common with all others, must be kept in order or it cannot be counted upon when needed, its care is simple but must be done at regular intervals The plunger being of leather, must be kept well-oiled, so that it will not dry, a few drops of oil put in through the holes at the top of the barrel, once a week, will suffice Once a month the pump should be taken apart and cleaned, the valves in the plunger and nozzle washed in alcohol, oiled and replaced The air valve vent needs a drop of oil once a month

## A FURTHER STUDY OF ASPIRATION IN GYNAECOLOGY\*

By JOHN VAN DOREN YOUNG, F.A.C.S

**W**ITH the advent of aspiration in the treatment of gynaecological conditions, a most important step forward has been taken, as prior to its use there was no method by which the indicated procedures could be directly and accurately carried out

The indicated procedures, based on the lesions to be treated are as follows

- 1 The mechanical removal of infection and infectious material from the cervix, cervical canal, and uterine cavity
- 2 The emptying of the crypts of the cervical glands
- 3 The drainage of Nabothian cysts
- 4 Hyperemia of the infected area
- 5 Cervical stimulation
- 6 Secondary stimulation of the uterine musculature, with resultant contraction and relaxation, and a betterment of circulation and lymphatic drainage
- 7 Restoration of muscular tone

That the ordinary methods of treatment do not fulfill the above outlined indications I feel sure will be admitted. One of the most common and intractable conditions met in gynaecology is infection of the cervix, in all its stages it constitutes a focal infection which is a menace to the local and general health of the patient, and in its course threatens not only damage to the cervix but remote structures, it is seen in all ages, and civic conditions

In my experience local treatment has failed to relieve this condition, operation carries with it the uncertainty of surgery done through an infected area. Deep cauterization, while of great value, is destructive of tissue that may be restored, and therefore must be used with care. It was a recognition of the foregoing facts that led me to devise an instrument for the production of intermittent aspiratory hyperemia, and since its completion I have found its usefulness covered a much broader field than I anticipated, and coupled with chemical sterilization and other methods of local and general treatment, my results are far better than I had ever obtained before its use. Whether aspiratory stimulation is effective beyond the uterus, I am not prepared to say, but it would seem logical that the relief of inflammatory and circulatory conditions, especially those associated with subinvolution and retroversion,

would have a beneficial effect on all the pelvic structures

Aspiratory stimulation is in my opinion the key to the treatment of a multitude of conditions, both in gynaecology and in surgical conditions generally, wherever there is infection, circulatory stasis, or where stimulation of a superficial area will cause reaction in the deeper structures aspiratory hyperemia has its usefulness

In all probability the theory of hyperemia by aspiratory stimulation originated with cupping which was done in the early history of medicine, and certainly antedated the theory of Bier

The application of the principle as suggested by the author is different in method than either cupping or the ordinary Bier hyperemia. It has always appeared to me that a short or shallow cup gave suction only, for that reason I devised a cup of considerable length, and of various sizes and shapes

The requirements that I found necessary to meet in the instrument, for the application of this theory, were three, namely

- 1 That the cup should be long enough to give a vacuum cushion between the object to be stimulated and the end of the cup

If the tissues to be aspirated are soft, and the cup shallow, any strong suction will fill the cup with the tissue, and the suction will therefore be limited to the size of the cup, and the contact of the tissues to the walls of the cup will produce a pressure anaemia, with hyperemia only at the apex of the tissue in the cup

When the cervix is subjected to this type of cup, it is drawn down until the cup is filled, with the effect as described in the last paragraph, when the suction is released there will be a secondary hyperemia, due to muscular relaxation, but it possesses none of the stimulating effect of the primary hyperemia produced by the long cup

It was an effort to obtain this primary stimulating hyperemia that led me to devise the long shaft tube with its cushion of partial vacuum to act as a direct stimulant to the structures of the cervix exposed to it, and eliminate as far as possible the pressure anaemia, which in this tube is only a collar area where the tissue comes in contact with the glass, while the area exposed to the vacuum develops an acute active aspiratory hyperemia, or if the uterus is over active an acute muscular mechanical anaemia

and giv

A word as to the meaning of the term reaction  
It indicates, first, the degree of contraction of  
the uterine musculature, in response to aspiratory  
stimulation, which when normal causes a cramp-  
like pain, when mildly stimulated, described by  
the patient as equivalent to that of an ordinary  
menstrual pain, secondly the effect on the cervix,  
shown in congestion, anaemia, ecchymosis and  
bleeding, from or through, the cervix. It is  
obvious that in acute and subacute inflamma-  
tions, the degree of vacuum and the number of  
strokes must be limited by the intensity of the  
reaction, which will be much more severe than  
it is in sub-involution, circulatory stasis or retro-  
version, where the reaction is sluggish, and re-  
quires stimulation to a greater degree, and for a  
longer time, to obtain a normal response

In general fibrosis, hyper-involution and infan-  
tile uterus, both uterine and cervical reactions  
will be absent at the beginning of treatment, and  
require several applications before anything ap-  
proaching normal is obtained In this class of  
cases the strokes should be rhythmical, the degree  
of vacuum intense, the treatment continued for  
from 5 to 10 minutes or longer, bearing in mind  
the normal rhythmical contractions of the uterine  
muscle

In the treatment of cervical conditions the  
reaction of this organ is the guide, that of the  
uterus being secondary in importance, although  
it may at times take the first place by the degree  
of incidental pain, as for instance, in the treat-  
ment of an infected eroded cervix with an  
ascending lymphangitis the uterine reaction may  
be very severe, and overshadow that of the cervix.  
The degree of congestion, and amount of bleed-  
ing, together with the severity of ecchymosis  
must be carefully watched in order not to inflict  
unintentional trauma, as these reactions are very  
often severe and do not cause pain

Perhaps the most striking results I have ob-  
tained have been in cases of pathological mecha-  
nical retroversion *cum descensus*, especially post  
partum or post abortive, where the clinical find-  
ings are a large boggy uterus, with little or no  
muscular tone, circulatory stasis, both tubes and  
ovaries in the culdesac, a lacerated infected cer-  
vix, and an ascending lymphangitis On bimanual  
examination the fundus is indefinitely made out,  
and impossible of replacement After treatment  
the muscular structure of the uterus regains its  
tone and contracts to aspiratory stimulation  
The fundus becomes firm, and the uterus is  
easily replaced, with consequent restoration of  
drainage, relief of infection and improvement in  
circulation, local and general symptoms dis-  
appear, and in a percentage of the cases where  
birth trauma is not too extensive a permanent  
result may be obtained

I have devoted much time and study to the  
devisement of a method for the mensuration and

## A FURTHER STUDY OF ASPIRATION IN GYNAECOLOGY\*

By JOHN VAN DOREN YOUNG, F.A.C.S

WITH the advent of aspiration in the treatment of gynaecological conditions, a most important step forward has been taken, as prior to its use there was no method by which the indicated procedures could be directly and accurately carried out

The indicated procedures, based on the lesions to be treated are as follows

10, 11, 1 The mechanical removal of infection with the infectious material from the cervix, same size as the uterine cavity  
number 11 the duplicate of number 10, the application end is beveled, number 12 the cervical the application end belled to  $2\frac{1}{4}$  cm. diameter

In the application of the tubes to the cervix, the selection of the proper size and shape is an important step and requires some experience, as a general rule the tube should be as large as can be easily passed, and preferably belled as they fit the convex contour of the cervix better. If the tube is passed through a bivalve speculum the size cannot exceed number 4, and this only when the blades can be widely opened, where the blades are restricted by unyielding soft parts numbers 1, 2, 3 must be used. Numbers 10, 11, and 12, can be applied through a vaginal speculum, numbers 6, 7, 8 and 9 with the use of a Sims speculum, or where there is relaxation of the structures or birth trauma they may be applied without a speculum. In routine practice I prefer a thin-bladed bivalve speculum, as it offers the least obstruction to the passage of the tubes at the same time giving the best exposure of the cervix, and allowing the tube to be applied by sight and the observed aspiratory reaction recorded.

In some cases it is of advantage to introduce the tube without the speculum, in doing this we have two types of cases, one where the vagina is too small to allow of the use of a guiding finger, and the other where relaxation or birth trauma or both, have made the vagina roomy enough to use the large tube plus the guiding finger without any inconvenience to the patient. Greater ease of introduction will be had if the introitus vaginal wall and tube are thoroughly lubricated.

When the tube is passed without the guiding finger, care must be taken to locate the cervix by the examining finger, after its withdrawal, introduce the tube in the ascertained direction

would have a beneficial effect on all the pelvic structures

Aspiratory stimulation is in my opinion the key to the treatment of a multitude of conditions, both in gynaecology and in surgical conditions generally, wherever there is infection, circulatory stasis, or where stimulation of a superficial area will cause reaction in the deeper structures aspiratory hyperemia has its usefulness

In all probability the theory of hyperemia by aspiratory stimulation originated with cupping which was done in the early history of medicine, and certainly antedated the theory of Bier

The application of the principle as suggested by the author is different in method than near the cupping or the ordinary Bier hyperemia. that used in days appeared to me that a short or hold of the tube gave suction only, for that reason placed in the introitus of considerable length, and of posterior vaginal wall shapes finger of the left hand, that I found necessary to beside the tube and a finger, for the application of application end, until the tube is then manipulated until it is long enough to (under the guidance of the finger) between the object to completely cover the cervix of the cup

In cases of extensive cervical ectopy, the cervix is soft, and trophy, with or without descension, suction will fill the tubes number 8 and 9 are used. If the cervix is firm, suction will there exists they are applied by sight of the cup, and the

Aspiration intensity is varied in proportion to the degree and length of time of application, traction on the tube, and the number of aspiration units per treatment. This type of cup is filled,

To illustrate, if it is desired to give a last para stimulation from  $\frac{1}{2}$  to 1 stroke of the tube, there will liberated at once, or if a very strong muscular reaction is indicated, from 1 to 4 strokes, held in the stimulus with traction on the tube before the hyperemia is freed, and by increasing the number of aspiration units per treatment. In the case of a very stimulus the degree of aspiration intensity, the degree of partial and cervical reaction must be carefully observed in order to avoid unintentional trauma to the

I wish to emphasize two important points to it, and that the tube must be placed over the cervix, the pressure in the centre of the aspirated area, a collar the degree of aspiration intensity be maintained with the by the conditions under treatment vacuum

The pathological conditions in which hyperemia is indicated may be summarized as follows: an acute

whereby records of some value might be made, that would indicate the progress in the treatment of gynaecological cases, hence I have devised the following plan

In the second column on the card marked L is noted the amount, character and reaction of the discharges found in the vaginal vault when the speculum is introduced, as—when there is none, and from 1+ to 4+ when present, modified as follows ac, acid, al, alkaline, cl, clear, cd, cloudy, tk, thick, op, opalescent, m, mucilaginous, o, odor, etc.

In the last column is recorded the condition of the cervix, as lac, lacerated, erd, eroded, cyst, cystic, inf, infected, etc. The vaginal vault is then wiped free from discharge, and the selected tube put in place over the cervix, then indicated aspiration given, and recorded in the column marked asp, as previously described

The amount, character and reaction of the mucus drawn from the cervix is then noted in column marked m, using the same general plan as for vaginal vault mucus, with the difference that the signs 1+ to 4+ indicate a relatively smaller amount. It is often necessary to clear the cervix of thick mucus before it can be completely emptied by aspiration. This is done by twirling a cotton tipped wooden applicator in the canal. If difficulty is had in removing the mucus plug, the cotton is dipped in 10 per cent agno., which coagulates the mucus and renders its removal easy. The aspiration is then continued until the canal is clear

The presence or absence of blood, as the aspiration proceeds is next noted in column B, as—or up to 4+, also if there are clots, and whether the blood comes from the cervix or through the os, as fr c or th o

The amount of bleeding is an indication of the degree to which aspiration may be used with safety. Where the bleeding is profuse, that is 4+, where the tube becomes half filled with blood, aspiration should be used very cautiously. During menstruation the uterus is hyper-reactive to aspiration and the resultant muscular contraction lessens rather than increases the flow

In a percentage of cases an ecchymosis will be noted in the aspirated area, varying from a few spots to the covering of the entire surface. It also shows from very fine spots to blebs of considerable size. The degree of this reaction is marked, from — to 4+ and is in index to the aspiration intensity, that the tissues of the cervix will stand, when 4+, the aspiration should be stopped. Record is made in column ecc and modified, as vf, very fine, f, fine, c, coarse, b, blebs

The circulatory cervical reaction is divided into primary and secondary, and in either may be an anaemia or congestion, and vary in intensity both

indicative of the circulatory and muscular condition of the uterus

My earlier observations seemed to indicate only a hyperemia as the response of the uterus to aspiratory stimulation. I recognized that this was intermittent, but failed to recognize that there were cases of hyper-irritability of the uterine muscle that when stimulated caused a true spasm, with a consequent and direct anaemia of the cervix, which undoubtedly extends through the entire uterus, either as a primary or secondary reaction

The primary reaction is that observed through the glass tube and is recorded in column rect (1), the secondary, that which is seen after the removal of the tube and is recorded in column rect (2). The degree of blanching is indicated as 2— where it is extreme, 1—, or —, in accordance with the reaction. The congestion is noted from 1+ to 6+, 1+ being very mild, 6+ extreme purpling

It is my observation that a degree of congestion follows stimulation of a normal uterus as a primary reaction, and I have designated this as 4+. This may continue as a 4+ in the secondary reaction, or be changed to 1—, but restoration to normal is short.

Where there is a primary blanching to 2—, there is an over irritability of the muscle

Where there is a primary congestion to 6+, a sluggish muscular reaction, with circulatory stasis is indicated. Where the secondary reaction is continued as 6+, and the return to normal is slow, muscular tone is completely lost. In some conditions a 6+ primary is followed by a 2— secondary, which indicates a delayed response to stimulation in an infected cervix

I feel sure that the basis of the congestion or anaemia lies in the response to stimulation of the muscle mechanical mechanism of the uterus section. I wish to stress, at this point, the fact that I do not claim aspiration as a substitute for any other method of treatment of proven value, but as an additional procedure of the greatest value

In point of fact I know nothing that will take its place, or cover as completely all the indications for treatment in gynaecological work

Among other methods of treatment that I desire particularly to call to your attention is the electro-cautery, as recommended by Gibson. This should be used conservatively and with aspiration

The chemical sterilization of the clean cervix is a much more exact procedure than where a layer of viscid mucus separates the application from the tissues to be treated. The applications I have found most effectual are tincture of iodine, mercurochrome 220 sol, 2 per cent solution nitrate of silver and argyrol. The tampon still has an important place as a vehicle of indicated medication

it was considered that she had bronchial asthma, and as such she was referred to us for treatment. Her attacks were no worse at night than during the day. The morning on rising was most difficult, for she raised at that time large quantities of flocculent thick sputum. Her history was not particularly characteristic of asthma, there was no family history of the same, and our impression was rather that of a severe bronchiectasis or pulmonary abscess.

*Examination* Examination of the chest revealed noisy crackling rales especially marked in the inferior lobes posteriorly. There were also fine crackling rales in both apices during inspiration. The respiratory movement was good and equal on both sides, there was no impaired resonance.

An X-ray of the chest showed remarkable parenchymal thickening throughout both lungs. This was so evident as to greatly increase the time of exposure in order to produce a picture of the ordinary density. The mediastinal glands were enlarged, the apices were relatively clear, the left lung being more intensely involved than the right. Her temperature occasionally was as high as 100° by mouth. Repeated sputum examination showed great masses of pus, many staphylococci and pneumococci. There never were any tubercle bacilli. When a culture was made of any specimen, a profuse growth of white glistening characteristics occurred in three days. It grew just as rapidly at room temperature as in the incubator. Microscopical examination showed a yeast. Previous to obtaining the sputum culture, she was tested by the intradermal method to the ordinary inhalants and to bacterial proteins, as she had been considered an asthmatic for some time. The inhalant reactions were insignificant. The bacterial proteins gave moderate reactions to streptococci, pneumococci and staphylococci.

Her nares showed considerable atrophy with no obstruction or impaction on the right side, and a non-obstructive cystic middle turbinate on the left. The tonsils were small and not infected. The post nares and larynx were negative. The trachea by means of the laryngeal mirror could be seen to have a reddened and thickened mucous membrane. On bronchoscopy the mucous membrane seemed to be of a dusky red color along the lower end of the trachea and on inserting the bronchoscope, it bled so profusely as to interfere with further bronchoscopic examination.

*Treatment* As she was at first considered to be an asthmatic, we treated her with a prolonged and intensive course of vaccines, but she showed no decided improvement until exposed to the x-ray. Improvement was so decided following each exposure to the x-ray that she called attention to it, and this fact associated with the profuse culture of yeast seemed to us significant. Con-

sequently, we treated her by weekly exposures to relatively small amounts of X-ray. We soon found that small exposures were indicated.

Our usual technique for X-raying a chest requires 3½ inch gap and 40 m a at 28 inch distance and a three second exposure. We were forced on account of the increased opacity of her lungs to expose for nine seconds with this technique in order to procure a picture of the usual density. Following this exposure, on numerous occasions, she complained of chills and fever with increased cough and sputum during the afternoon and evening of the day of exposure, followed during the next few days by a remarkable diminution in cough and expectoration and by considerable exhalation and feeling of well being. On one of our early exposures, nine seconds, the chills were so severe that she was prostrated within three-quarters of an hour. This was followed, however, by an almost complete cessation of symptoms, except that she was weak and tired during the remainder of that week. She did not return for treatment for three months, during which time she was practically free from cough. Her return then was on account of a slight recurrence of the cough and considerable sputum. Re-application of X-ray exposures, however, practically relieved her symptoms. She still raised some sputum. These specimens on culture did not show any yeast, so that, we considered her remaining symptoms to be those of a simple bronchitis. One year from the beginning of her treatment she said that she had been entirely free from cough and sputum since she was last treated.

At various times during her illness she was saturated with iodides. These eased her cough but gave her so little relief that she repeatedly discontinued the drops against our advice.

*Case 2*—A married woman, aged 52 years, complained of a chronic cough for two years. She had had recurrent attacks of quincy, many head colds and a chronic post nasal discharge. Her appetite was poor, she had occasional night sweats, had lost some weight during the preceding two years, complained that she tired very easily and had considerable exertion dyspnoea.

*Examination* The nares were moderately atrophic, the tonsils were large and infected. The chest revealed no pathology other than a few rales over the larger bronchi. Other examination was negative.

*Treatment* On account of the infected tonsils and repeated attacks of quincy, a tonsillectomy was performed. This, however, had caused no alleviation of her cough, when we saw her nine months later. At this time her cough still troubled her every day and night so that it interfered seriously with her sleep. Her weight had remained about the same as it was on her first visit. A sputum examination of several

The puncture of Nabothian cysts with the cautery or Buttles spear precedes aspiration. In large cysts the sac should be burned by an electro-cautery and reaspirated.

In the art of gynaecological diagnosis the value of the history, and all data obtainable will be enhanced by the study of the aspiratory reaction.

For comparison may I suggest the following as the normal reaction for the healthy uterus

L	Asp	M	B	Ecc	Rect (1)	Rect (2)
—	2+(6sm)	—	—	—	4+	4+s to n or 1-1 to n

Cervix normal

Variations from the above are many, and often instructive, as follows

L	Asp	M	B	Ecc	Rect (1)	Rect (2)
2+	4+(3sm)	3+cd	2+fc	3+	6+	6+2-s to n

Cervix, lac infected, eroded

Reaction found in an infected cervix with ascending lymphangitis

L	Asp	M	B	Ecc	Rect (1)	Rect (2)
—	—(15 sm)	2+	—	—	2+	2-1 to n

Cervix, large, hard and pale

Reaction found in general fibrosis

L	Asp	M	B	Ecc	Rect (1)	Rect (2)
2+	2+(10 sm 5 sv)	2+	tr	—	6+	6+1 to n

Cervix lacerated, eroded, infected

Reaction found in retroversion with circulatory stasis

L	Asp	M	B	Ecc	Rect (1)	Rect (2)
—	—(15 sm)	—	—	—	2+ or 2-	2+ or 4+ 2- 1 to n

Cervix small, may be nicked

Reaction found in hyper-involution or infantile uterus

By recording in sequence the aspiratory findings the progress of the case may be accurately studied and the value of the procedure in a given case determined.

My observations and study of intermittent aspiratory hyperemia in gynaecology justify me in presenting the following conclusions

1 Intermittent aspiratory hyperemia is a definite and distinct method of treatment in gynaecology of great value

2 It is more than simple suction with a shallow cup, or pumping mucus from the cervical canal

3 There is a true cervical aspiration and stimulation with resultant effect on the whole uterus

4 The degree of aspiratory intensity may be regulated to a nicety

5 Drainage of the cervical glands, canal and uterine cavity may be accomplished

6 The tone of the uterine musculature is improved

7 The uterine circulation is improved secondarily to the betterment of the musculature

8 Local infection of the cervix is relieved

9 The method is practical, logical and effective in gynaecology

10 It is easy of application

11 Intermittent aspiratory hyperemia is an addition to, not a substitute for, other methods of treatment of proven value

## THE TREATMENT OF BRONCHO-MYCOSIS WITH X-RAY

By ALEXANDER C HOWE, F A C S, M D, JAMES M SCHMIDT, M D,

BROOKLYN N Y

**I**N a routine examination of patients complaining of cough, it has been our experience on culturing the sputum to frequently find yeast or moulds. As this condition is mentioned in literature and no significance attached to their presence, such have always been passed over without attention. It was not until one patient who had a particularly severe cough, gave us repeated specimens of sputum, whose culture was rank with rapidly growing yeast, that we paid any attention to this fact. This yeast organism rapidly outgrew any staphylococcus or other bacterium present, so that on ordinary dextrose agar at 37½ C the surface of the agar was almost completely covered in three days time. Fearing some contamination, repeated cultures were made with a complete repetition of conditions of growth.

This is presented as Case No 1 in the following, including our method of treatment.

**Case 1**—A married woman, 56 years of age, with a family history of no significance, had had an amputation of the left breast many years ago for carcinoma, with perfect healing and no recurrence. She had always been well, able to work and travel and had spent many years in Germany, her return having been during the past year.

While in Germany she had had some irritating cough which had been treated there entirely without relief, and her return to this country was partly on account of the worry produced by this. It had, however, never been severe until the past two months, it was so violent and racking that she was prostrated after each paroxysm. After consulting a few physicians,

organisms have been yeast, though penicillia and aspergillus have frequently been present. It is true that yeasts and moulds can be obtained from sputa of patients who have no cough or other evident lesion of the respiratory tract, and when we consider that they are the ever present inhabitants of the air, it would be strange if this were not so. We have, however, never been able to demonstrate more than a single cell on an agar slant in any normal case and a finding of two or three colonies has been considered by us as pathological.

The fact that Case 3 had worked as a baker for twenty-five years appeals to us as of possible significance. We have one other baker possessing considerable yeast in his sputum and who has been treated in the manner described with relief of his symptoms.

The characteristics of growth are well described in any bacteriology, and we were unable to determine that these organisms differed in any way from the hundreds of others that have been described.

The texts on medicine report yeast infections of the lungs to be fatal. Any of the above cases seen a few years later may well have presented this outcome. The first and third cases reported above, refer to patients, both of whom have confessed to us many times that they considered themselves as good as dead.

Sodium or potassium iodide had been taken in large doses by some of our cases without improvement. It is an adjunct of great value undoubtedly and should be used in any case requiring relief. Usually, however, the X-ray has presented so prompt a beneficial response that the iodide has been merely something for the patient to do for himself, and he has had the tendency to stop it perhaps before we have told him to.

Examination of the chest has revealed signs ordinarily considered those of pulmonary tuberculosis. That no tubercle bacilli were ever found and that the symptoms were entirely alleviated may be an observation of importance. It would seem that any case of suspected tuberculosis in which no tubercle bacilli can be found should be examined for a possible bronchomycosis.

X-ray treatment of these cases gives relief. Sufficient time has not elapsed for us to judge of the permanence of the treatment.

*Summary* Herein are presented three cases of chronic bronchitis, in whose sputa fungi were demonstrated.

The fungi have disappeared following treatment with X-ray.

The disappearance has been followed with a remarkable improvement in the bronchitis.

## THE EARLY NEUROLOGICAL MANIFESTATIONS OF SYPHILIS \*

By JOHN L. ECKEL, M.D.

BUFFALO, N. Y.

ONE of the great human problems before us today is syphilis and a highly important portion of that total problem is syphilis of the nervous system. Neurosyphilis is so protean in its clinical forms that the significance of it as an etiological factor in nervous diseases is often overlooked. So frequently a physician keeps his eyes on the clinical form and course of a disease that he often forgets that syphilis is a cause of the syndrome.

The distinct dividing lines that were once held between hereditary, acquired and parenchymatous lues are slowly being obliterated and in time we shall probably cease to divide this disease into definite clinical types, but speak only of syphilis of the nervous system.

At the present time there are a few acute and sub-acute psychoses which are recognized to be due to syphilis, and with this fact established, the psychiatric borders of the disease are also much further extended and the classical pictures of forms or types of the disease are becoming

largely literary effort. The actual process going on in the nervous system is what should interest us, as this represents a conflict of man against the invader, the spirochete, and as a result there is not always present the classical type of any one of the various forms in which it may affect the nervous system, but there may be prominence given to one or another form of reaction.

Our knowledge of neurosyphilis is relatively recent, as one soon observes when he checks off the great milestones made in the advancement in this department of medicine. True, as early as the latter part of the fifteenth century it was thought that certain types of paralysis were due to syphilis. Also this was reiterated in the sixteenth and again in the seventeenth century. More accurate knowledge regarding this disease began to take form when that master pathologist, Virchow, in 1858, arranged and described the general pathology underlying syphilis. Our knowledge was further extended by Heubner as a result of his classical description of the vessel changes which was published in 1874. The first lumbar puncture was made in 1891 by Quincke.

\* Read before the Buffalo Academy of Medicine, February 13, 1924.

specimens revealed no tubercle bacilli, but many moulds of the type of *penicillium glaucum*. An X-ray of her chest showed a cervical rib on the right side and enlarged mediastinal glands but was otherwise negative. Her chest examination showed a few rales over the bronchi, no impaired resonance or accentuated voice sounds.

Five days after taking the X-ray she said she was better. Her cough was less violent and she slept through the night for the first time in months. She was exposed to the X-ray approximately once in five days. At each occasion, we used a  $3\frac{1}{2}$  inch gap and 40 m a at a 20 inch distance and exposed for six seconds. Examination of her sputum on several occasions following the first three exposures to the X-ray failed to demonstrate the presence of any fungi. Her improvement was continuous until twenty-three days after the first exposure when she stated that her cough had entirely disappeared and that she could raise no sputum. Following this visit, she did not return for five weeks and then she complained of a moderate recurrence of both cough and sputum. We exposed her chest as before for five seconds. Four days later, she was better and received a six second exposure. Ten days from her return, her cough was very slight and we exposed her chest for six seconds. In fourteen days, she said she had no cough and felt almost as though she could not cough. Following this we gave her two more treatments at five day intervals and when we saw her nine months later, she had had no cough or sputum.

**Case 3**—A man, 53 years of age, had left Germany thirty-three years ago and had always been healthy until the past five years, during which time he had a severe cough. His mother had an exertion dyspnoea, otherwise, the family history was negative. For twenty-five years, he had worked as a baker and it was while occupied thus that his cough began as a slight hack with no sputum, and no evidence of an associated cold or fever. The cough had gradually increased until it had become very severe the past five years. During this time he had been worse at night and when he awakened in the morning, also upon any moderate physical exertion. He could do light work without coughing or excessive fatigue. He perspired freely during both night and day and had a good appetite. Two years before we saw him he weighed 190 pounds and during that time had lost 25 pounds. He considered that he had asthma.

**Examination** The mucous membrane of his nares was pale and dry, showing a tendency to atrophy and poor ethmoidal drainage. His chest showed the respiratory movement limited on the left, resonance fair throughout, accentuated voice sounds in both apices, D'Espines sign negative, inspiratory rales in the left apex and below both clavicles. We felt certain that this examination with his history meant pulmonary tuberculosis.

An X-ray of his chest showed thickening of the parenchyma in the upper left lobe and slight peribronchial thickening throughout. The mediastinal glands were not abnormally large. His temperature ranged from 96.4 to 98 during five days. Blood pressure was 120—65. Repeated sputum cultures demonstrated the presence of many yeast cells.

**Treatment** Four days after the chest was X-rayed, without other treatment, he was much improved. At this time another X-ray was taken, exposing his chest twelve seconds. These pictures showed no other pathology. Seventeen days after his first exposure to the X-ray, his improvement was marked. There was less opacity in the X-ray plates. The chest examination showed the rales much less evident and respiratory movement seemed equal and good. Sputum brought at this time grew many yeast cells. He had twelve seconds of X-ray exposure at this visit.

Twenty-four days from his first exposure, he said he was better but that his cough had not improved as much as previously. We gave him a saturated solution of sodium iodide of which he was to take five drops three times a day. X-ray exposure was six seconds. In thirty days his improvement was marked. He could work without fatigue or even much cough or heavy exercise. Sputum brought at this time showed no yeast cells. X-ray exposure was eight seconds. In four months he had received twelve exposures and his cough was almost entirely absent. He raised a small amount of sputum from which no yeast cells could be obtained.

**Discussion** The above are typical of ten cases in our experience. We have had one case of asthma show yeast cells, out of many for whom sputum cultures were done. She had practically cleared up from a most severe allergic inhalatory type of asthma, before we were able to find any yeast cells. A few small doses of X-ray cleared the remaining symptoms. This case seemed to combine an allergic asthma with a bronchomycosis and the symptoms of the latter did not disappear until treated with X-ray. Also, the history of these patients seems to differ noticeably from that of asthmatics. Their cough is more that of a chronic bronchitis, that is continuous, and less spasmodic and intermittent. There is less complaint of orthopnoea and they do not present the typical whistling rales.

As is well known in any laboratory, all types of moulds and yeasts may be found if enough sputa are cultured. Some are typical and many present the variations of intermediate types. Little attempt has been made to entirely classify them. We have found enough for our clinical purposes, to know that yeasts or moulds are present in the sputum of a case which is complaining of a chronic cough, and which can not be otherwise accounted for. The predominating

quent involvement of the nervous system. In this statement Stokes also agrees.

When the meninges first become involved, we may or may not have clinical symptoms. Thus, cases of severe syphilitic meningitis have been encountered, with slight headache as the only symptom present, while severe headache and nausea have been found when only a meningismus was the cause of the complaint, as shown by negative spinal fluid findings.

When other than pure meningeal symptoms develop in the nervous system, then we are no longer dealing with incipient lues of the central nervous system, but with definite systemic involvement.

While every case of syphilis should have his fluid examined before he is discharged as cured, even in the presence of a negative blood, this becomes imperative in all cases in which the blood does not become negative after the second course of treatment. A so-called Wassermann fast blood in early syphilis nearly always means some systemic involvement of the disease, and calls for careful analysis of the nervous, cardiovascular, osseous, gastro-intestinal and other systems, to search out the one involved. Frequently the spinal fluid is found the offender, and it is in such cases that energetic treatment should be instituted to prevent, if possible, the later development of one of the serious parenchymatous types of the disease.

Syphilis of the central nervous system may exist for many years without the production of any clinical symptoms, but on the contrary, such manifestations may be early, even a few weeks after the appearance of the secondary symptoms of the disease. In such cases, when symptoms present themselves, they are usually manifested by meningeal disturbance, such as headache, nervousness, poor sleep, poor concentration, and added to this, poor vision, or there may be hearing involvement or some irregularity in the outline of the pupils, sluggish light reaction, or there may be various types of pain present or ocular palsies.

Such a case recently came under my observation in which the individual, a male, developed one or two small pimples, which had all the appearance of a chancroid. However, his family physician, to play safe, on the third day of observation sent his blood to the State Laboratory and a negative Wassermann reaction was returned. Under proper treatment these pimples soon cleared and the individual thought himself well. About six or seven weeks later he began having sharp pains in the legs, particularly below the knees and in the feet. These were cramp-like in character and were so severe that he was obliged to give up work. At first the condition was thought one of neuritis, but when it became worse we were asked to give our opinion as to

the cause of the trouble. Careful examination of the nervous system failed to reveal any organic disturbance. Several times during the examination he had sharp cramps in his feet, which were severe enough to draw the feet and legs up, and he showed considerable facial distortion. He had no definite signs of neuritis.

With the history, we felt that there must be lues in this case, so took his blood and tapped the spine. The blood serum was strongly positive. Spinal fluid showed an increase of cells, about 12 per cmm, a definitely positive globulin and a mild change in the luetic zone with the gold-sol test, but gave a negative Wassermann in the spinal fluid. This is a very good example of early involvement of the central nervous system during the so-called secondary period of the disease. Of course, these symptoms cleared rapidly under energetic treatment.

The fact of a negative Wassermann occurring during the first week following the presence of primaries is not an uncommon thing, and I wish to emphasize here this fact, so that we may not be satisfied in such cases with one negative test, but should have it repeated at weekly intervals until we are satisfied that there is no lues in the case.

In sharp contrast to this case, another patient, male, 38, infected seventeen years before he came under our observation, stated that following the infection he had a short period of mouth treatment and thought himself recovered. He felt no symptoms whatever until a few months before we saw him. He states that he then began to feel restless, that his sleep was disturbed, and that there were pains from time to time in various portions of the body and that he had a feeling of apprehension, as of some imminent danger. He lost weight.

Examination of the nervous system showed no physical signs whatever. However, the history of the case, plus the very meager amount of treatment he had received, led us to test up his blood, which was found to be strongly positive. I then suggested spinal puncture and found a very strongly positive spinal fluid. He was subjected to combined method of treatment and all symptoms cleared as shown by reactions. Apparently we were here dealing with the meningo-vascular type of disease, which was somewhat more pronounced in the meninges than in the vessels. It is this type of syphilis of the nervous system which yields best and gives us our most satisfactory results.

Physical signs of the nervous system may develop a few months after infection and manifest themselves with slight irregularity in the pupils or by double vision, or by mild retinitis, or involvement of the eighth nerve, occasional pains along the course of the fifth nerve. Associated with these there may be brisk tendon

Whilst this was done more for medical reasons than for definite research, still it soon opened a large field of possibilities, and a few years later we find Ravaut, Sicard and Widal publishing articles on the cellular changes in the spinal fluid from various types of disease of the nervous system. Some years later, 1903, they added the proteid changes occurring in abnormal fluids. That same year, 1903, Metchnikoff published his article, wherein he stated that he had successfully transmitted the disease to apes. The following year Alzheimer and Nissl published their monumental piece of work on the histopathology of syphilis of the brain. In 1905 Schaudinn and Hoffmann described the spirochete. The next year Wassermann added the serum diagnosis to our knowledge of the disease. Plaut in 1908 applied the principles of this test to the spinal fluid. In 1909 Ehrlich gave us salvarsan, and in 1912 Swift and Ellis salvarsanized serum in the treatment of syphilis of the central nervous system.

Noguchi and Moore, 1913, succeeded in isolating the spirochetæ from the brains of general paralytics and also from cords of tabes, thus forever casting from medical literature the term "parasyphilitic disease" and placing these two conditions in the rank of true syphilitic disease. In 1914 Lange applied the principle of colloids to spinal fluid and gave us his famous gold-sol test, which has further assisted us in differentiating types of the disease of the nervous system. From then on, with the major points established, numerous workers have advanced every phase of our information until at the present time the literature on this disease is most voluminous.

#### DISSEMINATION OF THE SPIROCHETES

From the primary focus of infection the dissemination of the spirochete is early. Brown and Pearce<sup>1</sup> have shown that within forty-eight hours they could obtain living spirochetes from the inguinal glands after inoculation of the testes of rabbits. They were able further to obtain spirochetes from blood culture on the seventh day following inoculation. They believe that there is a rapid multiplication of the spirochetes after infection and that they spread through the body rapidly and invade other tissues and lymph glands and the blood, and thus become widely distributed before the presence of the initial lesion. They believe that the primary lesion is the result of a concentration of spirochetes at a certain point. If no marked concentration occurs, then we have an explanation for the absence of primaries which is so common in histories obtained in neurosyphilis cases.

When the blood stream becomes involved the nervous system may show evidence at any time, as has been demonstrated by cases showing abnormal spinal fluids before the appearance of

primaries or secondaries. Still the vast majority of central nervous system involvement occurs during the secondary or florid state of the disease. It is possible for it to occur later, but this is not common.

#### EARLY TYPES OF INFECTION OF THE NERVOUS SYSTEM

Just why the nervous system or any other system should be selected by the spirochete after blood stream involvement, is hard to explain, except on the basis of the resistance of the individual to the spirochete. In some the nervous system is vulnerable, while in others the vascular, and in others the osseous, and still others the gastro-intestinal tract. Apparently there is little evidence to support the so-called "neurotrophic strain" theory, which has been so ardently supported by the French school. One of the chief arguments against this theory is that in late syphilis we have multiple systems involved. The first expression of the disease in the nervous system is always in the meninges, no matter what form it may assume later. This is demonstrated by an increase of cells in the fluid in over 50 per cent of cases during early secondary syphilis. Globulin increase is not present in quite so high a percentage, and the positive Wassermann reactions on fluid lag much further behind. This does not mean that over 50 per cent of all cases of lues have involvement of the central nervous system, but it does show that the presence of the disease in the blood stream affects the meninges in a high percentage of cases, which, if not treated may later develop into a definite infection of the nervous system. The evidence of irritation of the meninges without a positive Wassermann reaction, usually clears rapidly under treatment. It is agreed that the best time to test the spinal fluid to determine if the central nervous system is involved, is after a few injections of arsphenamine, or better still, at the end of the first course of treatment. At this time, most of the minor changes in the fluid have cleared and one is not so easily misled, and further, there is then no danger of a needle carrying spirochetæ from the blood stream to the spinal fluid as it passes into the canal, which has been reported by competent workers in a few cases. Indifference to the necessity for examination of spinal fluid at the end of the first or second course of treatment is quite probably responsible for the increasing instances of alarming accidents, especially those involving the cranial nerves, which are bringing modern therapeutic methods used in the treatment of syphilis into more or less disrepute.

Wile and Marshall<sup>2</sup> state that if the spinal fluid shows no involvement after secondary eruption, then there is little likelihood of any subse-

reactions and about 40 to 60 per cent showing negative Wassermann reactions of the blood. However, when the physical signs are those of tabes, no matter whether the blood and spinal fluid are positive or negative, our diagnosis should remain tabes. Also, even after the reactions are found negative, it is not proof that the condition is latent or inactive. It merely means that in so far as the blood and spinal fluid are concerned the antigen binding substance in them is so weak that it no longer holds the antigen, thus giving negative blood and spinal fluid reactions. The process is no longer active in the meninges but is doing its deadly work within the cord itself—that is, the parenchymatous portion of the cord.

When one recalls that tabes may begin to manifest itself in any portion of the cord, that is, either sacral, lumbar, dorsal or cervical, he will immediately understand that if we have the lower end of cord involved, we may have the knee and ankle jerks intact, but have absence of sexual power, and with this, some interference with bladder control, also diminished sensation of the testes. This is the so-called "low type" of tabes and is the kind that frequently consults the urologist first, and if he is not alert may lead him into error.

Should the process be a little higher, that is, in the lower portion of the lumbar cord or the lumbar enlargement, which is the most common site of the disease, then we have the classical picture with absence of knee and ankle jerks, some ataxia of gait, be it slight or great. Along with those symptoms, we may have the classical A. R. pupil and there may also be some pains here and there, shooting in character. The intensity of these symptoms will, of course, depend upon the age of the disease and the rapidity of the progress. When tabes is located in this portion of the cord, and presents the typical signs of the disease, I doubt if it is very often overlooked by any physician who will take the trouble to test the reflexes, gait and pupils.

The most baffling types of this disease are those cases which begin with abdominal symptoms, so-called complaints of indigestion or abdominal pains. It is in this type that the condition is very frequently overlooked, with the result that a lot of needless abdominal surgery has followed.

Many of these abdominal types show few or no neurological signs at all. In the history, however, of these cases, if taken carefully, one may often be able to elicit a lead by establishing a probable infection many years previous. Most of them may admit slight primaries, but may deny any secondaries. Of course, this is a frequent complaint in late central nervous involvement, that is, that the primaries and secondaries

may be absent, or be so slight that they are overlooked by the patient.

Stokes-Brown<sup>2</sup> report their results in the careful examination of two hundred cases complaining of abdominal symptoms. After careful history taking they found that nearly 80 per cent of them gave history of probable lues, and by careful analysis of the nervous system from every standpoint, plus serological reactions of both blood and spinal fluid, they were able to establish that the vast majority of them did have central nervous system syphilis, and that only a small percentage of them had definite stomach lesions.

One of the commonest types showing abdominal symptoms is the so-called "crises" cases. These, when they occur according to the classical description of a girdle pain, usually suggest tabes. However, the vast majority of them do not present that type of complaint, but more likely have intermittent pains following eating, with nausea, or even vomiting, inability to handle certain types of food, and also constipation. The peculiar thing about most of these cases is that very few of them show a hyperacidity of stomach contents after test meals, most of them showing a slight hypoacidity. Another strange feature about many of the abdominal cases with severe pain, is that the spinal fluid is often negative. In these cases the disease process has probably involved the vagus, the abdominal ganglia and sympathetic system, and these combined produce the pain complained of.

It is a very safe rule to follow in dealing with vague abdominal conditions associated with pain, to bear in mind the possibility of lues in each and every case, and when a clear-cut diagnosis of some other condition cannot be made, it is far safer to do serological test on both blood and spinal fluid before proceeding with another line of treatment. This, in a great many cases, will save needless surgery and other types of treatment.

One could recite many cases to illustrate these points, because many of them do not present any neurological signs whatever and the only way one learns of the presence of lues is by careful analysis of blood and spinal fluid.

The so-called cervical tabes occurs from time to time and usually manifests itself by pains and paresthesia confined to the upper extremities and along the neck. There is usually present some ataxia of the finger-finger and finger-nose test, and usually also some pupillary changes present, sufficient to arouse a suspicion of diagnosis, which would thus suggest serological analysis to complete.

Quite frequently the first and only symptom of beginning tabes is dimness of vision, which upon careful analysis of eyegrounds proves to be early optic atrophy. The patient will usually

jerks, headaches, poor concentration, restlessness. A combination of these symptoms leads one to suspect a diagnosis of syphilis of the nervous system.

In these early cases involving the nervous system wherein there are physical as well as clinical symptoms, it is quite important that we should make an effort to fix the type of involvement if possible, that is, as to whether we have a meningeal type or meningo-vascular or neuritis, or early tabes, or paresis, or the gummatous variety. This is not a very easy problem, so early. It has been our experience that meningeal or meningo-vascular types clear rather rapidly under treatment. Many of these cases may show the paretic or zone one curve with gold-sol test on the start and lead one to suspect that we have an incipient case of paresis to deal with, but after a few combined treatments this curve breaks and we have then a zone two curve. Later this may diminish in intensity and as improvement continues the other reactions clear up. While it cannot be positively stated that when a curve does not change from a paretic type after energetic treatment, we are dealing with an incipient case of paresis, still we can recall a fair number of cases which have been under our care that eventually did develop paresis. At the present time we have under our observation at least four such cases, which, after prolonged treatment, still show the paretic type curve, and we are awaiting with deep interest the final outcome in these cases. Will they clear up, or will they be paretic? We fear the latter.

It might be of interest to recite briefly the history in one of these cases. A young man, 24, who at the time of his primaries presented himself to a very competent man for treatment, and was given in all five courses of arsphenamine, followed by mercury and iodides. At no time did his blood Wassermann become reduced to negative, but fluctuated between a one and a two plus. At the end of his fifth course of treatment he was referred to us for examination of the nervous system, and whilst we were unable to find a single sign or complaint referable to the nervous system, still with this tendency to Wassermann fast reaction in mind, we advised a puncture and found the fluid contained over 100 cells per cmm, a strong globulin, a four-plus Wassermann reaction and a gold-sol with a paretic curve. He was given a series of combined treatments, followed by a series of mercury in the spine, then by another series of Swift-Ellis combined with mercury, and whilst we reduced the intensity of the reaction of the spinal fluid to nearly negative, still his gold curve always remained paretic. At the end of the third course of treatment he left the city and we did not again see him for three and one-half years. When he returned he was a well-marked paretic, both physically and mentally.

In those cases which do not show enough symptoms to enable us to make definite diagnosis as to the exact type of involvement of the nervous system, and whose curves early are paretic and then break to a zone two curve, we feel that with the usual strenuous treatment we may be able to avoid a serious parenchymatous brain or cord involvement.

The meningo-vascular type may manifest itself in one of a great variety of ways, at any period, even up to thirty or more years after infection. It is not uncommon for one of these cases to begin his complaint with a gradual increasing nervousness associated with disturbance of sleep, dizzy attacks, hesitancy and stumbling over a word, or complaint that the flow of thought is not as easy as formerly. With this complaint there may be slight headache or occasional pain. These individuals usually consult one for their general nervousness and in the course of examination, assisted by a good history of the case, one is led to suspect that lues of the nervous system is the offender. Occasionally they may present only suspicious physical signs. Again there may be definite inequality of pupils, with one or both fixed to light. There may be brisk or diminished reflexes. There may be parenthesis. Beyond this we may find nothing.

In all such cases one should examine the spinal fluid to be sure of his diagnosis. Many of the so-called "strokes" in individuals under forty, are due to syphilis of the vascular system. Monoplegias and paraplegias are very frequently due to the meningo-vascular type of the disease.

#### TABES

When the symptoms of this condition are well established the diagnosis is easy, and we know that we are dealing with a very late manifestation of involvement of the nervous system, and in this paper we shall not spend time on this advanced type, because the syndrome is very familiar to all. Our time here will be given to the non-classical types, that is, to those cases which either reveal only a few or no physical symptoms, and which are forever giving us great difficulty in diagnosis.

It must be constantly borne in mind that tabes is a rather late manifestation of syphilitic involvement of the nervous system and that it rarely appears before the fifth year and may not show any symptoms to attract the patient's attention until as late as thirty-five or even forty years after infection. It is not strange, therefore, that we frequently encounter cases that show negative blood and spinal fluid Wassermann reactions.

The percentage of negative findings in these cases varies somewhat with the observer and the number of cases reported upon. However, I feel that a fair average would be from 30 to 40 per cent showing negative spinal fluid Wassermann

Rarely do we find any superficial sensory disturbance in paresis. However, I might state that the general sensibility to pain is lowered, in that these individuals do not react to stimuli in the same way, no matter where applied, as does the normal individual. This is best shown when one does a lumbar puncture, for very few of them make much fuss over this operation.

If we can establish one or more of the above symptoms, with history of slight but general increase of the mental symptoms mentioned above, and to this possibility add a history of lues or possible lues, I think that the serological tests are in order.

Paresis usually shows a fairly high cell count, nearly all lymphocytes, also definite increase of globulin and albumen, and the paretic curve on gold-sol test. This is quite a constant factor and in my experience rarely or never breaks under treatment, no matter in what form applied. Also 99 per cent plus of positive blood and spinal fluid Wasserman reactions.

If one wishes to give the picture of paresis as it presents itself later in the disease, then he would have to take the separate types mentioned above and give the clinical symptoms of each of these when they are well established. Briefly, the depressed type will show delusions of self-accusations and inadequacy, plus fine tremors and pupillary changes, speech, reflex and serological disturbances.

The agitated type shows restlessness, anxieties, fears, worries, poor sleep, plus the physical signs of the disease.

While the grandiose or expansive type deals in millions and has no hesitancy in writing checks for any sum asked. They are happy, agreeable, never complain, euphoric.

Then we may have the type showing focal symptoms, such as ptosis, partial hemiplegia, partial monoplegia, etc., with mental symptoms of the disease, also seizures and convulsions.

It is characteristic of paresis that some time during the course of the disease a remission of symptoms takes place. This does not occur in all cases but does in the majority of them. This remission may last for a few months or for a year or so, during which time the individual may be able to return to his work. This may occur with or without treatment. However, it is the consensus of opinion among those who have had extensive experience in the treatment of this disease by the combined method that the remissions come more frequently and last longer with treatment than without.

So far as is known today, there is no case of true paresis that has ever recovered. Brain syphilis may and frequently does simulate, both clinically and serologically, true paresis. The differential diagnosis is practically impossible except by therapeutic means. Should the individual

eventually clear and remain clear, we cannot apply the diagnosis of paresis, but must concede that the case was the cerebral type of syphilis.

A feature that is often met with in early paresis is the fact that so many of these individuals are holding important positions. Frequently have I run across early paretics who are railroad engineers and have charge of some of our fastest trains. Think of a paretic running the Twentieth Century Limited! It is for this reason that I think one should be careful in examining mild mental cases or severe neurosis cases, especially males, who present themselves in our offices, for the purpose of eliminating this disease. Because it may advance suddenly, and should the individual, perchance, have some important position, disastrous results to many persons may occur.

### HEREDITARY SYPHILIS

Hereditary syphilis very frequently involves the nervous system and the classification of these symptoms is similar to those in the acquired type. Jeans<sup>4</sup> of St. Louis has collected and studied a large series of these cases and reports that under two years of age all cases showed a positive Wassermann reaction of the blood, that 27 per cent of these gave a positive spinal fluid reaction, of which 32 per cent, in addition to the positive Wassermann reaction of the blood, that physical signs of the disease. In his series of children over two years of age showing positive blood reactions, 20 per cent only showed spinal fluid reactions positive, but 76 per cent of these older children with positive spinal fluid showed physical signs of the disease, and in this series all types of syphilis of the nervous system were manifest, that is, paresis, meningeal type, vascular type, muscular atrophies, etc.

In addition to all these types mentioned above, syphilis does produce a certain number of muscular atrophy cases. There is one type of spastic spinal paraplegia, known as Erb's disease, which is always due to syphilis. Syphilitic myelitis is not uncommon. Pure optic atrophy, without any other neurological sign, is also not an uncommon manifestation of the disease. Gumma may appear anywhere in the nervous system and give symptoms of tumor wherever present. Since the advent of arsphenamine, gumma is rather rare in the nervous system.

We may have neuritis due to syphilis and today we recognize a syphilitic type of neurosthenia and a pseudoparetic mental disturbance, and there are some confused states not clear-cut that are definitely due to syphilis. They may often simulate cases of mania.

So, in reviewing this monster, which is so protean in its manifestations, particularly in the nervous system, one cannot be too careful in examining these cases to look for signs or symptoms that might indicate the presence of this

be found to be healthy otherwise. Careful examination may help in establishing a history in such cases, and then serological reactions complete the diagnosis. Sudden ptosis or strabismus or double vision are frequently first symptoms complained of by patient, as indicating to him the beginning of some trouble in his nervous system. This is another and very frequent mode of onset of tabes.

We have confined our remarks here merely to the early signs and symptoms, believing that the more advanced classical pictures are so familiar to all that repetition of them here is unnecessary.

#### GENERAL PARESIS

It is variously estimated that about two per cent of all syphilitic cases eventually develop general paresis. This is also a rather late manifestation of the disease—that is, in its clinical symptomatology. However, bear in mind that the spinal fluid shows positive reactions from the secondary stage of the disease on, but the process has worked so slowly that the symptoms and physical signs do not present themselves until from five to thirty years after the infection. It differs in mode of onset, symptoms, in pathology and in the serological reactions somewhat from other forms of syphilis of the central nervous system. Just why these differences it is difficult to answer. The pathology is confined to the central nervous system as a whole, but is manifested most in the brain, particularly the cortex, in which, as the disease progresses the entire architecture of the cortex is upset. There is a tremendous increase in the vessels, plasma cell infiltration, glia cell increase, thickening of the meninges and tremendous increase of spinal fluid. The serological reactions are almost 100 per cent positive in both blood and spinal fluid. In fact, it is exceedingly rare to find either a negative blood or negative spinal fluid in a true case of paresis.

The clinical symptoms of this disease develop in most instances very slowly, however, in a few, rapidly. Usually they come so gradually that the family do not suspect anything wrong until the symptoms of the disease have quite well advanced.

Again, the disease manifests itself in quite a number of forms and here again we have difficulty in recognizing a sufficiently clear-cut set of symptoms to enable the average man to suspect syphilis of the nervous system. When one recalls that we may have the simple demented type, a depressed type, an expansive type, the agitated type, those with convulsions, and again types with localized brain symptoms, he will immediately see the difficulties in diagnosing this disease early on a basis of clinical signs alone. The earliest signs, no matter what the type may

be later, are usually slight changes in character and disposition. They are more or less absent minded, they are not as attentive to their family or their business, or to detail as they were wont to be, they are not as neat about their appearance and about their work as they were, slight lapses of memory show themselves, slight discourtesies and slight tendencies toward irritability creep in, all of these gradually increasing in intensity until finally the family or near friends of the individual begin to suspect that all is not well, and it is then that a physician is asked to see the case. If the patient co-operates, we may have the privilege of treating a relatively early case of the disease, if not, the symptoms may advance until we reach a point where the individual shows rather marked mental symptoms, in that there is considerable loss of memory, he begins to show less attention to his business, to his personal appearance, less attention to the family, misplaces things, does foolish things—especially shows reversal of form, that is, if he was parsimonious before, he is liable to become more or less liberal, taking active interest in charities, in the formation of business concerns and the advancement of this or that educational affair. Again, they may become depressed, accuse themselves of wrong, possibly remember that they have had syphilis and fear that this is working upon them and that it has upset their minds. Another type will become agitated, restless, show poor sleep, lack of concentration, inability to carry on work. Whilst others, again, may have inattention, marked dullness, slowing up of their general activities, occasional lapses of memory or lapses of speech control, or they may have twitching of the facial muscles, or even slight convulsive seizures.

When one examines these cases physically, he may or may not find definite physical signs. As a rule, however, there is some irregularity of the pupils and there may be some inequality in size. The vast majority of them react to light and accommodation, however, many of them show the A R pupil. In most of these cases there is fine tremor of the facial muscles, most marked about the eyes and mouth and tongue, also fine tremor of the fingers. The speech, if tested carefully, in nearly all cases shows some disturbance and slight eliding of syllables, or slight stumbling over certain consonants. Again, if one tests the writing, he will find that it is not up to his usual form, that is, there may be fine tremor displayed, a tendency to misspell words, and the entire product is not nearly so neat as formerly.

One observes that the tendon reflexes are usually quite active or exaggerated, except in those cases in which we have a combined form of tabes and paresis, known as taboparesis, and here, if we have a lumbar type of tabes, there will be absence of tendon reflexes plus mental signs.

Finsterer immediately took up the method and found it to be of great value, particularly for operations upon the kidney.

Kappis published his first researches in this field in 1912 in which he reports successful renal and thoracic operations. His interest continued and in 1922, ten years after his first contribution, reported eighty operations upon the kidney by this method.

Ziegel used  $\frac{1}{2}$  per cent novocaine, blocking the posterior roots of the 8th dorsal to the 3rd lumbar. He performed over 2,000 operations under paravertebral anaesthesia between 1914 and 1919, eighty-eight of which were upon the kidney.

Braun, writing in 1914 from the Kiel clinic, considered paravertebral anaesthesia most important, all kidney operations being done under it at that time. Hartel in 1916 wrote an extensive article on the technique of paravertebral anaesthesia. He calls attention to several precautions of importance.

In France, Pouchet, in 1921, and Duvergey have utilized paravertebral anaesthesia. The latter reported seventeen kidney operations, only one of which was unsuccessful.

The most extensive work in urological surgery has been done by Snitzer, working in the splendid clinic of Prof. Illyes in Buda Pest.

American literature on this subject is not very extensive. The principal articles dealing with major surgery under paravertebral anaesthesia have been written by Farr<sup>13</sup>, Lowry<sup>14</sup>, Labat<sup>15</sup>, and Meeker<sup>16</sup>.

This subject is also briefly discussed in the text books of Allen<sup>17</sup>, Braun<sup>9</sup>, Dunn<sup>10</sup>, Farr<sup>13</sup>, Finsterer<sup>19</sup>, and Labat<sup>20</sup>.

#### METHOD OF ADMINISTRATION OF SACRAL AND PARASACRAL ANAESTHESIA

The following is the routine procedure which we have developed, and attempts to deviate from it have caused unsatisfactory results in some way or other.

The patient is prepared for operation in the usual manner, as regards purgation enemata, etc. Before going to the operating room morphine gr  $\frac{1}{8}$  in 50 per cent magnesium sulphate is injected. This is repeated in one half hour and a third dose given just as he starts for the operating room. Upon arrival he is placed upon his elbows and knees or upon his abdomen on the table. The skin is then infiltrated at the point where the needle is to be inserted, the skin first having been sterilized in the usual manner.

The operator then palpates the coccyx, and sliding his finger above this bone reaches the lower part of the sacrum and is usually able to palpate the sacral hiatus without difficulty. The sacral horns adorn the lateral borders of a triangle of which the hiatus is the apex. A 6-inch needle is inserted through the anaesthetized skin and into the sacral canal by puncturing the liga-

ment which covers its lower end. After penetrating this ligament the needle is easily pushed in  $1\frac{1}{2}$  to 2 inches. It has to be guided carefully, otherwise it will impinge on bone and must, of course, be deflected. One learns to tell by the ease with which the needle passes and the direction it takes whether it is in the canal. One of the directions the needle may take is just over and to one side of the roof of the canal. This error is detected by the direction of the needle and the fact that it passes with difficulty. One can also check upon this position, if improperly inserted, by the fact that as soon as the injection is started, the tissue at the end of the needle will infiltrate with the solution.

The sacrum has a great many variations in different individuals and a careful study of the osteology as well as the course of the nerves is a necessary preliminary investigation.

The needle having been inserted into the canal, one observes its end carefully to see whether either blood or spinal fluid runs out. In the event of this complication the needle is withdrawn and the injection made later. If the solution runs in easily one is sure that the needle is in the canal. If, however, the injection is made with difficulty one is quite sure that the needle is not in the canal, and the tissues over the sacrum are observed for infiltration.

We have been using 35 cubic centimeters of freshly prepared 2 per cent novocaine solution injected into the canal without the addition of bicarbonate solution. We have not used adrenalin in the injected solution because we believe that it adds materially to the toxicity of the drug.

The injection into the canal is extradural and presumably elevates the dura from the bone under the pressure used. In this procedure one may safely use a quantity up to 60 cubic centimeters provided the solution is not toxic. We then inject 1 per cent solution of novocaine into the first, second and third sacral foramina on each side in accordance with the method of Labat. The foraminae are located rather easily by passing the needle into the depression just below the transverse processes and by pointing it mesially and slightly upward one's needle usually enters without great difficulty. From 5 to 10 cubic centimeters of 1 per cent novocaine solution is injected into each foramen, the needle being withdrawn in order to distribute it in the entire length of the foramen.

The patient is then placed on his back and 20 minutes by the clock is allowed to elapse before the operation is begun. By that time the part of the patient which sits on a saddle including the scrotum, urethra, and bladder, should be thoroughly anaesthetized, if the injection is successful.

We have found that by starting to operate too soon the patient will often feel pain, and such an apprehensive state of mind will be produced that every movement will cause complaint. On

condition. Care in examining, both physically and serologically, will save many an individual from an early breakdown, because it gives opportunity for early and intensive therapy, and if this is then properly applied, the number of late neurosyphilitic cases will be tremendously reduced, with even a chance for complete prevention.

## KIDNEY AND PROSTATE OPERATIONS UNDER REGIONAL ANÆSTHESIA MOVING PICTURE DEMONSTRATION \*

By OSWALD SWINNEY LOWSLEY, A.B., M.D., F.A.C.S.,

From the Department of Urology (James Buchanan Brady Foundation), New York Hospital

SEVERAL milestones in the advancement of urological surgery stand out above all others. The discovery of general anæsthesia afforded the means to stimulate progressive surgeons in all types of operations. This, of course, included surgery of the urinary organs.

The next great advance in the march of progress was the invention of the cystoscope by Nitze in 1897. Since that date a very great many ingenious instruments have been devised which renders it possible for the urologist to make his investigations so complete that it is almost never necessary for him to do an exploratory operation upon any organ of the urinary tract.

In recent years the most important advance made has been the realization that the case which is about to be subjected to an urological operation must undergo a period of preliminary preparation. This practice refers particularly to cases which have suffered from retention of urine with its attendant damage to the renal tissue. The development of several excellent methods of testing renal function has been of great value in determining the length of time for the drainage of the individual case. The most important thing about the period of preliminary treatment, in the case of the prostatic, for instance, is to have no set time for it. The operation should only be done when the patient has reached his maximum of renal efficiency. It is our custom to examine repeatedly the 24 hour specimen of urine to determine the excretory ability of the kidneys, a phenol-sulphone phthalein test to determine the renal activity during the time that test is actually being made, and finally a blood chemical examination is made to determine the amount of retention of substances which are ordinarily excreted in health. These tests are repeated as many times as necessary to determine when the patient has ceased to improve and therefore may be considered to have reached his best possible condition and is fit to be operated upon.

The most recent great advance in urologic surgery is the development of methods of adminis-

tering various types of local anæsthetics so that major operations upon the urinary and genital organs may be done.

A brief history of the development of these methods follows.

F. Cathelin and Durant (1902) used sacral anæsthesia for the purpose of treating grave neuralgias, sexual neuroses, and incontinence of urine. The former first used plain water, salt solution and later added cocaine, novocaine, codeine, or morphine. By this method Cathelin reported 49 per cent of the cases of incontinence of urine cured, 35 per cent materially benefited, and 4 per cent failures. He failed in his attempts completely to anæsthetize the sacral nerves in humans but was successful in dogs. A. Læwen used 20 to 25 cubic centimeters of 1½ to 2 per cent novocaine and placed the patient in the sitting posture for some minutes after injection, with the idea of retaining the solution in the lower end of the vertebral canal. O. Gros recommended the addition of sodium bicarbonate, which he states permits the solution readily to penetrate the nerve sheaths. Strauss prepared his solution by the addition of sodium sulphate which he maintains prevents the decomposition or adrenalin, which he also used. Hertzler recommends the uses of quinine and urea, using 60 to 90 cubic centimeters of 6/10 per cent solution. B. Lewis and L. Bartels reported 48 successful cystoscopies out of 68 attempted, and D. R. Pickens reported 81 out of 100 attempted. Splendid work on this subject has been done by Thompson of Galveston, who follows the method described by M. L. Harris. Albert J. Scholl, Jr., used sacral anæsthesia successfully in 140 cystoscopies out of 150 in which it was used.

Hugo Sellheim originated paravertebral anæsthesia in his experimental work on surgery of the abdomen. His work was published in 1905.

Six years later, 1911, Læwen reported a successful nephrotomy on an old man suffering from arterio-sclerosis, emphysema and chronic bronchitis. He produced anæsthesia by injecting the posterior roots of the 9th dorsal to the third lumbar nerves.

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, N. Y., April 23, 1924.

ranify a little more it is wise to use seven cubic centimeters here.

Attention has several times been called to the danger of puncturing the pleura, but one is more apt to strike the next rib than the pleura. However, it is well to remember that at the point where we travel with our needle, while the nerve is often covered by plenty of muscular structures, it is only separated from the pleura by the internal intercostal fascia. The pleura is also a little closer to us on the left side.

The Quadratus block is now started by injecting widely in all directions (but principally toward the center of this space) both superficially and into the deep planes from the four points previously noted as the corners of this area. This effectually blocks all nerves which may in any way supply the superficial or deep portions of the abdominal wall in the vicinity of any of our possible incisions.

Previous to making the incision it is wise to test out all these areas for anæsthesia and if necessary, reinjection may be made. Patients will often say that they feel a cold sponge, when they cannot feel a needle prick. After the patient is found ready to proceed, the head should be well screened off, and the patient's attention be kept diverted as much as possible during the operation by a competent attendant.

The incision should be made as carefully as possible so as not to jar or startle the patient. All tearing or rough dissection should be avoided as it is difficult to anæsthetize against that. When the renal pedicle is reached traction often occurs and when this causes pain which may be of a nauseating type, it may be advisable to inject a little novocaine around it. In patients who are extremely nervous, the sight of an ether can and a mask with a few drops on it will often work wonders. These patients are usually ready for operation a few moments after the injections are completed. The total amount of novocaine used should rarely be over eighty cc. or at the most one hundred and fifty cc. of a 1 per cent solution.

When the patient leaves the table there is no evidence of any shock and as a rule he is quite comfortable.

In 1920 the author performed six operations under sacral anæsthesia. These were as follows: one Young-Punch operation, one suprapubic operation, one perineal prostatectomy for carcinoma, three perineal prostatectomies for adenomatous hypertrophy of the prostate.

The results of the anæsthesia were so unsatisfactory that they were given up, but were resumed again on February 3rd, 1923, the sacral being reinforced by parasacral infiltration in accordance with the method of Labat. Since that time there have been 210 major operations done in the Department of Urology, New York Hospital, as follows: prostatectomies, prostatotomies,

nephrectomies, neperotomies, seminal vesiculectomies, perineal sections for stricture, litholopies, other operations.

#### POST-OPERATIVE CARE

This care is interpreted to begin immediately after the actual removal of the gland. The wise surgeon puts a stop to the hemorrhage before beginning to sew the wound. This is easily accomplished in the perineal prostatectomy because bleeding points can and are observed, clamped and ligated in a satisfactory surgical manner. The general ooze which always occurs is controlled by packing the cavity of the prostatic capsule lightly with gauze strips. If one packs any cavity too tightly the viscus exerts its well known quality of attempting to expel the foreign body and the spasmodic contractions resulting tend to cause continued hemorrhage. Suprapubically a very different problem presents itself. The cavity of the former site of the enlarged prostate is in a most inaccessible spot. It is possible in case of severe hemorrhage to put the patient in trendelenburg position and expose the area, clamp and tie off bleeding vessels, and this should always be done when the hemorrhage is not controlled by light gauze packing.

The use of such appliances as inflated rubber bags to control hemorrhage, or very tight packing of any sort seems to be particularly contraindicated because of the resulting pain, tenesmus and continued hemorrhage.

Any steps that are to be taken to prevent hemorrhage should be instituted at the time of operation, and the hope that further packing or other manipulations might be accomplished in case the patient continues to bleed for several hours after operation usually results in disaster, because any manipulation causes great pain, and very little pain administered at a time when the patient is in a state of depressed blood pressure will have a profound effect and often throws the patient into shock.

It is important to keep the patient dry and warm and for him to be transported to his bed with as little delay as possible.

Blood pressure estimation is the most important single item in the observation of the patient for the first 24 hours. This should be taken every two hours or oftener until it has passed entirely through its period of depression and has arisen to a safe level again.

The two most gratifying features of operations under regional anæsthesia have been the facts that the hemorrhage is very much less than it is under any inhalation anæsthesia and the subsequent drop in blood pressure is not nearly so great. In only three cases has the post-operative blood pressure been less than 100 mm. out of 210 operations performed by this method in the past eleven and one-half months.

It is well to avoid post-operative pain by any

the other hand, if one waits until a thorough anæsthesia occurs the patient goes through the operation without protest

#### TECHNIQUE OF ADMINISTERING PARAVERTEBRAL ANÆSTHESIA FOR RENAL OPERATIONS

It is of the utmost importance that all nervous excitation be reduced to a minimum. The procedure should be briefly explained to the patient and he may be informed as well of the advantages to be gained by a painless operation without a general anæsthetic. The lessened danger and post operative discomfort should also be called to his attention. The patient must be apprised of the fact that he will feel a half dozen or so little needle pricks when the first injections are made. That after these perhaps a few pulling sensations may be felt, which will at once be relieved on his calling attention to them.

The confidence of the patient is as absolutely essential here, as it is in all regional procedures. Naturally more difficulty will be experienced in highly nervous individuals than in those of a more stolid type.

In the Illyes clinic, morphia and atrophine are rarely used in the preparation of the case for operation, and they believe their patients do better without it. Our fellow countrymen are as a rule quite different from the European. They have as a general thing either been living under high nervous tension, or a more or less protected existence. We prefer to give morphine in fractional doses as recommended by Gwathmey.

When the patient is taken to the operating room, he should be lying comfortably on his back on the carriage. Avoid all unnecessary display of instruments and appliances, or signs of haste or flurry. Position. The best possible position for administering the anæsthetic is to place him sitting on the side of the table, body bent slightly forward with shoulders also rolled a little anteriorly and the head slightly bowed. The patient's feet should rest on chairs, placed at such a height that they just allow the thighs to form a right angle with the abdomen. An attendant should stand in front of the patient, and provide the necessary support.

In paravertebral anæsthesia applied to renal operations it is only necessary to use the nerve blocking on one side, as our procedures are usually unilateral. To achieve success in this anæsthesia we must successfully block the eighth, ninth, tenth, eleventh and twelfth dorsal nerves. These nerves all send off branches which in one way or another reach the anterior, lateral and posterior parts of the abdominal wall, supplying one or all of its cutaneous and muscular planes. With the lumbar plexus we are chiefly concerned with the first lumbar and its two main branches, the Ilio-hypogastric and the Ilio-inguinal nerves. A few branches from some of the other lumbar nerves may appear, but even though they are

unimportant, will be well covered by our regional block of that area.

After the patient is comfortably posed, we proceed to the location of our landmarks, and as each one is reached, it should be daubed with iodine or some other fairly indelible antiseptic substance. For our intercostal injections we locate a spot for needle puncture starting in its eighth space, usually opposite the angle of the scapula, and then down in each successive space, till we reach the twelfth nerve below the last costal border. These punctures are about three and a half to four centimeters from the midline of the back, roughly a little over two fingers breadth from the spinous process. One must be fairly sure that he has the right spinous process as they sometimes are quite irregular.

We now look for the landmarks of our lower abdominal block or as some call it, the Quadratus block. For this purpose take a point about three centimeters from the spine of the first lumbar vertebral extending anteriorly. Then a point opposite the anterior end of the twelfth rib and above the anterior superior spine of the ilium. The lower landmarks are the interior and posterior spines of the ilium. Over each one of these points we have noted we raise a weal with a medium size Luer type syringe and needle, using one per cent novocaine. For nerve blockings the European clinics use what is known as an eight to ten cm Schieber canula. In this country the Labat needles of about a length similar to those we use in our parasacral anæsthesia answer the purpose quite well.

The injections are started by inserting our needle first through the weals in the intercostal spaces at right angles to the surface of the rib, down to its lower border, injecting as we go. When the lower edge of the rib is struck we withdraw the needle a little and then incline it to an angle of forty to forty-five degrees in the direction of the vertebral column. The needle is then forced over close along the lower inferior border of the rib until we impinge upon the body of the vertebra. This brings us close to the intervertebral foramen, and between the ribs and transverse processes.

Hartel advises at this point that we proceed with caution, as here there is the possible danger of toxic symptoms from rapid absorption of the anæsthetic or its entrance into the Dural Sack. However, in this particular technique the anæsthetic does not reach this point in such a massed amount as recommended by Kappis, Ziegel, Jentzer and others. Our injection is continuous from the time the puncture is first made until we impinge upon the vertebra, so that there is no concentration anywhere or is it necessary. Five cc of the novocaine is used in each dorsal nerve block, from the eighth to the eleventh. As the twelfth nerve is below the rib and its branches

## PERIODIC HEALTH EXAMINATIONS

How to interest physicians in making periodic health examinations has been widely discussed during the past year. The physicians of New York State have done pioneer work in actually preparing themselves for the examinations. The group which composes the Medical Society of the County of Kings was the leader in the movement (see this Journal, 1924, pages 739 and 905), and now New York County is working out the same problem, but along slightly different lines. Both, however, confine their activities to the education of physicians, and leave the question of reaching the people to lay organizations.

The general features of the Brooklyn campaign for periodic health examinations has been as follows:

1 Preliminary lectures at the meetings of the Medical Society of the County of Kings

2 The formation of the Brooklyn Health Examination committee of representative physicians and laymen in order to reach both physicians and laymen

3 The examination of one hundred medical men and a discussion of the findings by experts, as the first step in educating physicians how to make the examinations

4 The preparation of four-page leaflets,—the so-called gray leaflets,—setting forth the principles of making the examinations. Leaflets have already been prepared on Venereal Diseases, and on Cancer, and a copy has been sent to every physician in Brooklyn.

means possible. With inhalation anæsthesia the patient recovers consciousness in from 10 minutes to 2 or 3 hours after the completion of the operation. The patient then begins to suffer pain which is much more severe if he is too tightly packed, and this has frequently been the cause of bringing on shock, because it occurs at just the time when the reaction period is at its lowest ebb, as shown by the blood pressure level.

A particularly great advantage of the regional anæsthesia as induced by novocaine is that its effect continues from six to 10 hours to a certain extent and tides the patient over this trying period of depression so that he frequently does not have pain at all and usually sleeps well the night after operation.

### SHOCK

Shock is induced by loss of blood, traumatism of tissues with subsequent pain, and injury to the nervous mechanism. Certain toxic substances are also frequently a factor. It is marked by very low or imperceptible blood pressure, cold, clammy skin, rapid, shallow breathing and various other well known symptoms and signs. Since the adoption of regional anæsthesia in our operations upon the kidney and prostate, shock has almost disappeared from our wards. There has been one case of shock in the past year and that one was not fatal.

Before instituting regional anæsthesia we were well versed in the treatment of shock and felt called upon to write a paper on the subject.

The ordinary methods of combatting shock are familiar to everyone. They consist of raising the foot of the bed, keeping the patient warm, the administering of fluids and stimulants by mouth and rectum, salt solution administered intravenously raises the blood pressure for 30 minutes and in slight cases this is often enough to tide them over. We prefer, however, the use of gum-glucose solution as prepared by the New York Hospital Laboratory and described by us in 1921. This method is a slight modification of that successfully used by Ward and Farrar at the Woman's Hospital.

The physico-chemical principles involved in the use of this intravenous medium are fundamentally as follows: glucose being a crystalloid, like salt, will absorb water through a semipermeable membrane—and peripheral blood vessel wall is a semi-permeable membrane. Tatum noted that in shock and following hemorrhage there was increase in the dextrose content of the blood and he explained this as an effort on the part of the organism to combat the pathology. Hence the incorporation of the sugar substance with

the acacia. However, even though this deduction be not appropriate, the use of glucose intravenously is not new and when given according to Woodyatt's formula, viz., 0.8 grams per kilogram of body weight, it is utilized in toto. More rapid introduction leads to elimination with an excessive excretion of water through the kidneys. The gum is a colloidal substance, in 6 per cent solution it represents a viscosity equal to that of blood and the osmotic pressure of the blood colloids. Hence this solution cannot leave the circulatory system, and what is more, will hold in the circulation the fluid that the crystalloid glucose has attracted by osmosis. In summary, therefore, and by comparison with saline, similarly a crystalloid when introduced into the blood stream passes rapidly into the cell tissues and it, being a non-oxidizable substance, rapidly reverses the process and a subsequent waterlogging of tissues occurs. Clinically this may be expressed in terms of blood pressure that is elevated and maintained for an average thirty-maximum minute period by saline, at the end of which time it has left the circulation. With gum-glucose, on the other hand, the pressure is elevated and maintained for a minimum of three hours at the initial level with a slight subsequent fall, yet seldom to the danger threshold.

An important thing to remember in shock is that many a person has been killed by kindness. The proper procedure is to take all the measures possible for the benefit of the patient, then leave him strictly alone and do not allow internes, nurses or orderlies to bedevil him with unnecessary hospital routine measures. More patients have been brought out of shock by intelligent neglect after proper methods of stimulation have been instituted than have been by elaborate methods which perpetually annoy the shocked patient.

### CONCLUSIONS

The conclusions to be drawn from this study are:

- 1 Major operative procedures upon the kidney and prostate under regional anæsthesia are being done successfully.

- 2 There is much less bleeding by this method than by any inhalation anæsthesia.

- 3 The patient ordinarily suffers no pain for 7 or 8 hours after operation, hence avoiding this dangerous element in the production of post-operative shock.

- 4 The development of new and less toxic anæsthetic agencies and methods of administering them bids fair to mark the next great progress in urological surgery.

## THE NICOLL CHIROPRACTIC BILL

Assemblyman Nicoll has introduced a bill known as Introduction No 185, which is entitled "An Act to Define and Regulate the Practice of Chiropractic"

The effect of this bill, if passed, would be to permit upwards of a thousand chiropractors now practicing in this State, to be licensed without any test of their fitness. One of these persons so licensed, whose qualifications have not been the subject of any test by the State, is entitled to be appointed by the Regents an additional member of the State Board of Medical Examiners, and such appointee is given the right to summon witnesses and compel their attendance and to take testimony concerning any matter over which the Board of Medical Examiners has jurisdiction, whether it relates to chiropractic or any other subject with which the Board has to do.

Such additional member of the Board need have no educational qualification that the Regents may inquire into other than that of graduation from a chiropractic school requiring a minimum attendance of nine continuous months and a maximum attendance of eighteen months over a given period of time. And as to this attendance and this qualification, the certificate of a chiropractic school shall be *prima facie* proof.

In this bill, therefore, it appears, as in previous bills giving special privileges to chiropractors, that the chiropractic school is the judge of fitness for license rather than the officials of the State of New York. These institutions are primarily interested in the financial return obtained from tuition fees, as they are corporations organized and existing

for profit. In the main they are privately owned and are not essentially educational institutions, but business enterprises. The exemption from examination is further predicated upon the requirement that such a chiropractor shall have practised a given number of years in this State.

It has been held that chiropractors practice medicine in violation of the Medical Practice Act. A number have been convicted of this offense, and at least one during the last year, who would meet every requirement of the Nicoll bill for license as a chiropractor without examination, was convicted of manslaughter and sentenced to Sing Sing prison. Nevertheless, the Nicoll bill makes a virtue of such offenses against the law and rewards continuous practice in violation of the law by granting to the wrongdoer a license without examination.

The Regents, under this bill, are given no power over the chiropractic schools from which those seeking exemption have heretofore received diplomas. The diploma mill graduate must be exempted from examination if he can prove attendance upon a chiropractic school for the required time.

The exemption clause of this bill, therefore, is no part of any plan for the regulation of the practice of chiropractic, but is the grant of a special privilege to certain individuals now defying the law of this State, to whom the bill is to be a reward for their transgression rather than a test of their fitness. The vice of these provisions of this bill should be clearly exposed.

## PREGNANCY—COMPLICATED BY CYSTITIS—DRY LABOR —METASTATIC ABSCESES.

In the fourth month of her pregnancy a prospective mother consulted a physician and made arrangements with a maternity hospital for her pre-natal care and for attendance upon her at the time of her delivery. Periodic physical and urinary examinations were made. Examination of the urine revealed that the prospective mother was suffering from a chronic interstitial nephritis which was confirmed by the blood pressure findings, which were 148/82, and at a later date

160/80. Upon these findings the patient was ordered on a strict non-protein diet and other instructions were given her for her proper care and conduct. She was also advised to appear bi-weekly for routine examination until she became in active labor. Upon measurement the pelvis was found to be normal in size. During the pre-natal period, upon examination, the presentation, position and posture of the fetus were determined. Two weeks prior to her de-

5 The preparation of a form for recording the results of the examinations

6 Enlisting the cooperation of the Brooklyn Tuberculosis Committee in bringing the need of having the examinations made to the attention of the people of Brooklyn through the Brooklyn Health Examination Committee

7 The establishment of a clinic for the examination of those who are unable to pay for the service

The period of time since the plans have been put into operation has been too short to permit reports to be made regarding the success of the work. The plan is going forward satisfactorily.

The Medical Society of the County of New York formally voted to undertake a campaign for periodic health examinations at its meeting on May 26, 1924, and appointed committees to carry on the work. The general committee made its report at a meeting of the Society on December 9th. This report was printed on page 32 of last week's JOURNAL.

The New York County plan sub-divides the work into three subdivisions

1 The education of the physician

2 The technique and methods of securing and filing histories for physicians

3 Publicity for the physician and the public

The plan for the education of physicians has already been put into operation, and consists of a symposium of seventeen lectures as described in last week's JOURNAL. Each lecture is given by a prominent specialist who was chosen because of his teaching ability as well as his skill in his own line. We printed an abstract of the first lecture, that on Gastro-Intestinal Diseases, in last week's JOURNAL, and we are printing one on Genito-Urinary Conditions on page 93 of this issue.

This is pioneer work. The lecturers have had no precedent to follow, and are to be commended for responding to the call to prepare simple talks on the pre-clinical signs of diseases in their several specialties. We hope to be able to print abstracts of the whole series for the instruction and encouragement of physicians throughout New York State, and the Nation.

Physicians who attempt to make periodic health examinations are entering a field which is almost new and untried. When a research worker enters a new field of work, he usually does so quietly, and works upon his problem for months or years before he announces his find-

ings. But the very nature of the problem of making periodic health examinations requires a considerable amount of publicity. This is embarrassing to an ethical physician who is undertaking a new line of work, and who fears that he may either omit something essential or put too much stress on a minor sign. The requirement is that a physician shall have in mind the essential signs of approaching disease in practically all the specialties in medicine. It is not required that the examiner shall be a specialist in any of these lines, but it is required that he shall be keen to perceive a few symptoms to which he has previously given little thought. Dr. Chace, for example, in the first lecture, stressed heart-burn and other common signs of indigestion as the precursors of gastro-duodenal ulcer, appendicitis, cholecystitis, tuberculosis, and other grave conditions, and Dr. Keyes stressed the importance of frequent painful urination as a sign of an approaching genito-urinary disorder, and dwelt upon the necessity of including a rectal examination in every general examination of an adult patient. Now and then a physician may be found who habitually carries in mind a few common symptoms in each of the seventeen specialties on which lectures are given in the New York County symposiums, but we have our grave doubts that any considerable number of physicians have this knowledge at their finger tips, or that they can recall all the signs during the course of an examination. Our opinion is confirmed by hearing the remark frequently made by prominent physicians who heard the lectures, that they had not thought about this or that point before.

It is easy for an amateur examiner to tell a patient that he is threatened with gastric ulcer, or cancer, or heart failure, or Bright's disease, or insanity, and so give the patient a fright. The reaction of that patient will be to go to another doctor who will tell him to go home and forget his trouble, on the ground that there is nothing the matter. Another type of patient will seek the doctor who for a big financial consideration will claim to ward off the approaching disease by a long course of treatment. The best preventive of either of these results is a knowledge of the fundamental preclinical signs of disease in each specialty. This is the object of the lectures of the New York County Symposium.

The Medical Societies of the counties of Onondaga, Monroe and Albany, have already taken steps to promote the periodic examinations in their communities. We shall be pleased to print reports of the progress of the work in any county that undertakes it.

## THE NICOLL CHIROPRACTIC BILL

Assemblyman Nicoll has introduced a bill known as Introduction No 185, which is entitled "An Act to Define and Regulate the Practice of Chiropractic"

The effect of this bill, if passed, would be to permit upwards of a thousand chiropractors now practicing in this State, to be licensed without any test of their fitness. One of these persons so licensed, whose qualifications have not been the subject of any test by the State, is entitled to be appointed by the Regents an additional member of the State Board of Medical Examiners, and such appointee is given the right to summon witnesses and compel their attendance and to take testimony concerning any matter over which the Board of Medical Examiners has jurisdiction, whether it relates to chiropractic or any other subject with which the Board has to do.

Such additional member of the Board need have no educational qualification that the Regents may inquire into other than that of graduation from a chiropractic school requiring a minimum attendance of nine continuous months and a maximum attendance of eighteen months over a given period of time. And as to this attendance and this qualification, the certificate of a chiropractic school shall be *prima facie* proof.

In this bill, therefore, it appears, as in previous bills giving special privileges to chiropractors, that the chiropractic school is the judge of fitness for license rather than the officials of the State of New York. These institutions are primarily interested in the financial return obtained from tuition fees, as they are corporations organized and existing

for profit. In the main they are privately owned and are not essentially educational institutions, but business enterprises. The exemption from examination is further predicated upon the requirement that such a chiropractor shall have practised a given number of years in this State.

It has been held that chiropractors practice medicine in violation of the Medical Practice Act. A number have been convicted of this offense, and at least one during the last year, who would meet every requirement of the Nicoll bill for license as a chiropractor without examination, was convicted of manslaughter and sentenced to Sing Sing prison. Nevertheless, the Nicoll bill makes a virtue of such offenses against the law and rewards continuous practice in violation of the law by granting to the wrongdoer a license without examination.

The Regents, under this bill, are given no power over the chiropractic schools from which those seeking exemption have heretofore received diplomas. The diploma mill graduate must be exempted from examination if he can prove attendance upon a chiropractic school for the required time.

The exemption clause of this bill, therefore, is no part of any plan for the regulation of the practice of chiropractic, but is the grant of a special privilege to certain individuals now defying the law of this State, to whom the bill is to be a reward for their transgression rather than a test of their fitness. The vice of these provisions of this bill should be clearly exposed.

## PREGNANCY—COMPLICATED BY CYSTITIS—DRY LABOR —METASTATIC ABSCESSES

In the fourth month of her pregnancy a prospective mother consulted a physician and made arrangements with a maternity hospital for her pre-natal care and for attendance upon her at the time of her delivery. Periodic physical and urinary examinations were made. Examination of the urine revealed that the prospective mother was suffering from a chronic interstitial nephritis which was confirmed by the blood pressure findings, which were 148/82, and at a later date

160/80. Upon these findings the patient was ordered on a strict non-protein diet and other instructions were given her for her proper care and conduct. She was also advised to appear bi-weekly for routine examination until she became in active labor. Upon measurement the pelvis was found to be normal in size. During the pre-natal period, upon examination, the presentation, position and posture of the fetus were determined. Two weeks prior to her de-

livery she entered the hospital complaining of labor pains. Upon examination it was found that the same were not true labor pains, and the patient was advised to return to her home and to come to the hospital again upon the appearance of the true labor pains.

Several weeks later she returned to the hospital, at that time in active labor. A vaginal examination revealed the cervix  $2\frac{1}{2}$  fingers dilated and that the membrane had ruptured prior to the examination. Upon examination the foetal heart could not be heard. After examination the patient was placed in bed to await further dilation. Repeated examinations by auscultation were made to determine the presence of the foetal heart, which, however, was not heard. On the following morning, about sixteen hours after the patient's entry into the hospital, the cervix was found fully dilated, but again the foetal heart could not be heard. An obstetrician was then called in consultation by the attending physician, who examined the patient and found the position of the fetus to be R O P, but he could not hear the foetal heart, and the patient was advised that her child was undoubtedly lifeless and it would be necessary to deliver her by forceps under a general anaesthesia. After catheterization a general anaesthesia was administered to the patient and with low forceps she was delivered of a still-born. The placenta was expelled intact. Pituitin was administered to the patient and she was returned to bed.

For several days after the delivery it was necessary to catheterize the patient and medication was also administered. On the fourth day after the delivery the patient had a sudden rise in temperature from practically normal to  $104^{\circ}$  with complaint of headache and pain on urination. During the next seven days the temperature ranged from  $101^{\circ}$  to  $104.2^{\circ}$  with her pulse about 120. The patient also complained of continuous headache and pain on urination. During this time medication was administered to the patient and repeated examinations made of the urine and blood. On the latter day a consultant was called in to examine the patient. For about a month the patient's condition did not improve, she continued to have a soaring temperature, with a continuance of the other complaints. Examination at this time disclosed swellings upon the left buttock and calf of the left leg. This was diagnosed as metastatic abscesses and incised on the following day by the consultant who had been called in. The pus was evacuated from the abscesses and the wounds packed and drained. The patient remained in the hospital for about six weeks thereafter. During part of the time the wounds were discharging profusely and were dressed and irrigated daily.

At the time the patient left the hospital there was an impairment of function in the left leg. A physical examination disclosed that this impairment of function of the left leg was not due to any nerve lesion, as her reflexes and muscular conformation were found to be quite normal, that while she was able to walk, her gait was rather awkward due to the fact that she was tremendously overweight above her hips, and because of the lack of use, her legs were becoming weaker. At the time of the physical examination the two scars caused by the incision of the abscesses on the buttock and calf of the leg had healed.

Shortly after leaving the hospital this patient caused a suit to be instituted against the hospital and the physicians who attended her, charging them with failure to furnish her with the necessary care and attention at the time she entered and was a patient in the hospital. In her complaint, as a specification of negligence, she claimed that no examination was made of her between the time she entered the hospital at about 6 P M and 7 A M the following morning, when she was informed that she had a dead child in her body. She also claimed that due and proper care were not taken in the delivery of the dead fetus, in that the instruments used were not properly sterilized, as she claimed her body, immediately after delivery, became unusually swollen, inflamed and diseased to an alarming extent. She claimed that by reason of the infection she was compelled to remain four additional months in the hospital. She also claimed that her pedal extremities were permitted to be without a fair and proper amount of circulation, exercise and massage during her confinement in the hospital, which condition caused a shrinkage of the muscles and cords and necessitated the subsequent use of wheel chairs and crutches for her means of locomotion.

Extensive preparation was made in this action and when the case came on for trial the court directed the impanelling of a jury for the trial of the action. Plaintiff's attorney sought to procure a settlement, even for a small amount. In carrying out the policy of the State Society in the defense of malpractice actions to make no settlement in an action where it does not appear that the defendant physician was guilty of any negligence or error in his treatment of the patient, the repeated attempts of the plaintiff's attorney to procure a settlement were refused. After the plaintiff's attorney had exhausted his endeavors to settle the action, he consented to its discontinuance, thus favorably ending another action against the physicians.

# LEGISLATION

By JAMES N VANDER VEER, M.D.  
*Chairman Committee on Legislation*

## EVOLUTION OF MEDICAL POLITICS \*

Medical politics may be defined as the study of the methods by which the services of the profession can most easily and suitably be made available to the community. As I have often said, in earlier and simpler days when the relation of the doctor to patient was that of individual dealing with individual, there was little or no need for collective organization of the profession. The doctor, who owed no duty except to the patient who employed him, simply did his best as a man and a doctor for that patient, and needed no organization to help him. But with the growth of collective employment of doctors by associations, corporations, and the State, the profession has been compelled to study sociological and

political problems and to adapt itself to new and constantly changing conditions.

All controversies relating to fees, ethics, conditions of service, and the like, resolve themselves on analysis into an attempt, by a process of "trial and error," to find new ways or improve the existing ways by which the services of the profession are made available to those who need them. Every employer knows that if a workman is compelled to work for insufficient wages or in surroundings which are unsuitable, that workman will not do the best work of which he is capable. In the same way, if the conditions of employment of medical men are repugnant to their feelings and traditions, or if their payment is inadequate, patients will not get the best of which the profession is capable.

\* From an address by Alfred Cox, M.A., B.D., Medical Secretary, British Medical Association in *British Medical Journal*. Reprinted from the *American Medical Association Bulletin*, December, 1924.

## LEGISLATIVE NOTES

The 1925 legislature is now in session and already it is being flooded by bills of every character, including a number that would have a direct bearing upon the practice of medicine. Among these are our familiar friends the narcotic bill, the chiropractic bill and the medical inspection bill.

We hope that the chairmen of the County Societies will impress their legislators with the importance of acting deliberately on matters that would affect the practice of medicine. We hope, also, that the efforts are not limited to the chairmen, but that every member of the Society will assist by accepting the opportunity, wherever presented, of placing squarely before the lay public the physicians' honest desire to protect the public

welfare, and the obligation upon the public to assist them with favorable legislation.

The Medical Practice Act which has been prepared by the Department of Education has been introduced into the Legislature, and will be printed in our next week's issue.

The following organization was effected in the Legislature:

In Senate—President, pro tem, John Knight, clerk, Ernest Fay, Democratic floor leader, James J. Walker.

In Assembly—Speaker, Joseph A. McGinnies, clerk, F. W. Hammond, Republican floor leader, Simon W. Adler, Democratic floor leader, Morris Bloch.

## SUMMARY OF BILLS IN SENATE

Senate Int. No. 11—A bill introduced in the Senate by Senator Seabury C. Mastick of Westchester County, concurrent Assembly Int. No. 64, introduced in the Assembly by Assemblyman Herbert R. Shonk of Westchester County, would amend sections 172, 181, Labor Law, by prohibiting employment of females over 16 years of age more than 48 hours a week in factories and mercantile establishments, except that for not exceed-

ing eight weeks in any year, divided into not more than two periods, females may be employed not more than six days or 54 hours a week or nine hours a day, provided notice of such extension of working hours be sent to Industrial Commissioner at least three days before.

Referred to Labor and Industries Committee or both Houses.

livery she entered the hospital complaining of labor pains. Upon examination it was found that the same were not true labor pains, and the patient was advised to return to her home and to come to the hospital again upon the appearance of the true labor pains.

Several weeks later she returned to the hospital, at that time in active labor. A vaginal examination revealed the cervix  $2\frac{1}{2}$  fingers dilated and that the membrane had ruptured prior to the examination. Upon examination the foetal heart could not be heard. After examination the patient was placed in bed to await further dilation. Repeated examinations by auscultation were made to determine the presence of the foetal heart, which, however, was not heard. On the following morning, about sixteen hours after the patient's entry into the hospital, the cervix was found fully dilated, but again the foetal heart could not be heard. An obstetrician was then called in consultation by the attending physician, who examined the patient and found the position of the fetus to be R O P, but he could not hear the foetal heart, and the patient was advised that her child was undoubtedly lifeless and it would be necessary to deliver her by forceps under a general anaesthesia. After catheterization a general anaesthesia was administered to the patient and with low forceps she was delivered of a still-born. The placenta was expelled intact. Pituitin was administered to the patient and she was returned to bed.

For several days after the delivery it was necessary to catheterize the patient and medication was also administered. On the fourth day after the delivery the patient had a sudden rise in temperature from practically normal to  $104^{\circ}$  with complaint of headache and pain on urination. During the next seven days the temperature ranged from  $101^{\circ}$  to  $104.2^{\circ}$  with her pulse about 120. The patient also complained of continuous headache and pain on urination. During this time medication was administered to the patient and repeated examinations made of the urine and blood. On the latter day a consultant was called in to examine the patient. For about a month the patient's condition did not improve, she continued to have a soaring temperature, with a continuance of the other complaints. Examination at this time disclosed swellings upon the left buttock and calf of the left leg. tion of any of them or any synthetic substitute of any of them identical in chemical composition, but not apomorphine and its salts

12 "Cannabis indica" or "cannabis sativa" shall include any compound, manufacture, salt, derivative or preparation thereof and any synthetic substitute of any of them identical in chemical composition

13 "Habit forming drugs" shall mean coca leaves, opium, cannabis indica or cannabis sativa

14 "Manufacturer" means a person who by compounding, mixing, or other process of manufacture, produces or prepares habit forming drugs for sale on written orders and does not include an apothecary who compounds habit forming drugs to be sold or dispensed on prescription

15 "Wholesaler" means a person who supplies habit forming drugs on written orders

16 "The Harrison act" means the act of Congress, entitled "An act to provide for the registration of, with collectors of internal revenue, and to impose a special tax upon all persons who produce, import, manufacture, compound, deal in, dispense, sell, distribute, or give away opium or coca leaves, their salts, derivatives or preparations and for other purposes," approved December seventeenth, nineteen hundred and fourteen, as heretofore or hereafter amended

§ 422 Acts dangerous to public health Any unauthorized possession, control over, sale, distribution, prescribing, administering or dispensing of habit forming drugs is hereby declared to be dangerous to the public health, and a menace to the public welfare

§ 423 Acts prohibited It shall be unlawful for any person to possess, have under his control, sell, distribute, administer, dispense, or prescribe any habit forming drug except as provided in this article

§ 424 Sale on written orders 1 By whom and to whom sold A manufacturer, wholesaler, or apothecary may sell or distribute habit forming drugs only to any of the following persons and upon his written order

a To a manufacturer, wholesaler or apothecary

b To a physician, dentist or veterinarian

c To a public or private hospital

d To a hospital or institution licensed for the treatment of drug addiction

e To a person in charge of a laboratory where habit forming drugs are used for scientific or medical research work, but only for use in such laboratory

f To a person in the employ of the United States or of this state or of any political sub-

division thereof purchasing or receiving the drug by reason of his official duties

g To a captain or proper officer of a ship upon which no regular physician is employed, for the actual medical needs of the officers and crew when not in port Provided, however, that both parties to the transaction in each of the above cases are registered under the Harrison act if required by such act to be so registered

2 Order blanks A written order for the supply of any habit forming drug shall be signed in duplicate by the person giving it or by his duly authorized agent, one duplicate of which shall be presented to the person who sells or distributes such habit forming drugs and in the event of his acceptance of such order, each party shall preserve his duplicate of such order for a period of two years in such a way as to be readily accessible for inspection and it shall be subject to inspection by any public officer or employee engaged in the enforcement of this article Provided, however, that it shall be deemed a compliance with this sub-section if the person giving the order shall have complied with the provisions of the Harrison act respecting the requirements governing order blanks under said act

3 Possession lawful Possession of or control over habit forming drugs, obtained as provided in this section, shall be lawful if in the regular course of business, occupation, profession, employment, or duty of the possessor and in an amount necessary therefor

4 This section shall not apply to the supply of habit forming drugs on prescription or administered or dispensed by a physician, dentist, or veterinarian

§ 425 Preparations and remedies exempted The provisions of this article shall not apply to preparations or remedies which do not contain more than two grains of opium, or more than one-fourth of a grain of morphine, or more than one-eighth of a grain of heroin or more than one grain of codeine, or any salt or derivative of any of them in one fluid ounce, or, if a solid or semi-solid preparation, in one avoirdupois ounce, or to liniments, ointments, or other preparations which are prepared for external use only, except liniments, ointments, and other preparations which contain cocaine or any of its salts or alpha or beta eucaine or any of their salts or any synthetic substitute for them, provided that such remedies and preparations are sold, distributed, dispensed, or possessed as medicines and not for the purpose of evading the intentions and provisions of this article

§ 426 Professional use of habit forming drugs 1 Veterinarians A veterinarian may prescribe, administer or dispense habit forming drugs in

## THE NARCOTIC BILL

Senate Int No 115—A bill introduced in the Senate by Senator Morton J Kennedy of New York, concurrent Assembly Int No 215, introduced in the Assembly by Assemblyman Morris Weinfeld of New York, would add new article 22, and amend section 4-b, Public Health Law, and repeals section 1746, Penal Law, relative to habit-forming drugs

Referred to Public Health Committee of both Houses

Int 215

January 15, 1925

Introduced by Mr Weinfeld—read once and referred to the Committee on Public Health—committee discharged, bill amended, ordered reprinted as amended and recommitted to said committee.

## AN ACT

To amend the public health law, in relation to habit forming drugs, to provide for the control, possession, sale, prescribing, dispensing, dealing and and distribution of such drugs

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended by inserting therein a new article, to be article twenty-two thereof, to read as follows

## ARTICLE XXII

## HABIT FORMING DRUGS

Section 420 Short title

" 421 Definitions

" 422 Acts dangerous to public health

" 423 Acts prohibited

" 424 Sale on written orders

" 425 Preparations and remedies exempted

" 426 Professional use of habit forming drugs

" 427 Prescriptions

" 428 Record to be kept

" 429 Labels

" 430 Authorized possession of drugs by individual

" 431 Physical examination required

" 432 Instruments for injection of habit forming drugs

" 433 Exemption from restrictions

" 434 Drugs delivered to the state hospital commission

" 435 Notice of conviction of professional man sent to licensing board

" 436 Records confidential

" 437 Fraud or deceit

" 438 Commitment of addicts, procedure, discharge

" 439 Exceptions and exemptions not required to be negatived

" 440 Enforcement

" 441 Possession at time article goes into effect

" 442 Penalties

" 443 Constitutionality

§ 420 Short title This article shall be known as the narcotic drug control law

§ 421 Definitions As used in this article

1 "Person" includes any corporation, association, copartnership or one or more individuals

2 "Physician" means a licensed practitioner of medicine as defined by article eight of this chapter

3 "Apothecary" means a licensed pharmacist or druggist as defined by article eleven of this chapter

4 "Dentist" means a licensed practitioner of dentistry as defined by article nine of this chapter

5 "Veterinarian" means a licensed practitioner of veterinary medicine as defined by article ten of this chapter

6 "Medicine" means a drug or preparation of drugs in suitable form for use as a remedial or curative substance

7 "Sale" includes barter, exchange or giving away, or offering therefor and each such transaction made by any person whether as principal, proprietor, agent, servant or employee

8 "Dispense" includes distribute, leave with, give away, dispose of, and deliver to a person or to his agent to be delivered to him

9 "Administer" means only administration by a person authorized to administer habit forming drugs

10 "Coca leaves" includes coca leaves, cocaine, or any compound, manufacture, salt, derivative or preparation thereof, including alpha or beta eucaine, or any of their salts or any synthetic substitute of any of them, identical in chemical composition, but shall not include decocanized coca leaves, or preparations made therefrom or other preparations of coca leaves which do not contain cocaine

11 "Opium" (includes opium, morphine, codeine, diacetyl-morphine heroin) or any compound, manufacture, salt, derivative or prepara-

magistrate, be delivered to the state hospital commission unless destroyed according to law or by regulation of the commission. The commission may receive drugs surrendered to it subject to the rights of any person lawfully entitled thereto, and all drugs in final possession of the commission may be disposed of or destroyed under its direction. The commission shall keep a record of the receipt and disposition thereof.

§ 435 Notice of conviction of professional men sent to licensing board. 1 On conviction of any physician, dentist, veterinarian or apothecary for wilful violation of any of the provisions of this article, a copy of the sentence and of the opinion of the court or magistrate if any be filed, shall be sent by the clerk of the court, or by the magistrate, to the board or officer having power to suspend or revoke the license or registration of the person convicted, for such action as the board or officer deems proper.

2 At the request of such board or officer, the clerk or magistrate shall send to such board or officer a transcript of the record or of the proceedings in a court not of record, and such portion of the evidence as may be requested.

§ 436 Records confidential. Prescriptions, orders, or records required under this article shall not be open to inspection nor shall any information contained therein be divulged except for the purpose of enforcing the laws of this state or the Harrison act, or on the direction of the Department of State Police or of the police department of any city to an officer of another state, for the purpose of enforcing the law of such state.

§ 437 Fraud or deceit. Any fraud, deceit, misrepresentation, subterfuge, concealment of a material fact or the use of a false name or the giving of a false address in obtaining treatment in the course of which habit forming drugs shall be prescribed or dispensed, or in obtaining any supply of such drugs, shall constitute a violation of the provisions of this article and shall not be deemed a privileged communication. The wilful making of any false statement in any prescription, order, report, or record required under this article shall constitute a violation of this article. No person shall for the purpose of obtaining any habit forming drug falsely assume the title or represent himself to be a manufacturer, wholesaler, apothecary, physician, dentist, veterinarian, or make or utter any false or forged order or prescription for or label for a container of or for habit forming drugs, or affix such label, or alter, detach or remove any such label.

§ 438 Commitment of addicts, procedure, discharge. 1 At request of addict. A magistrate upon the voluntary application to him of any habitual user of any habit forming drug, may commit such person to any correctional or

charitable institution maintained by the state or any political subdivision thereof.

2 Person accused of crime. Any trial court having jurisdiction of a defendant who is a prisoner in a criminal action or proceeding, if it appears that the defendant is an habitual user of any habit forming drug and is suffering as a result of such use, may likewise so commit such defendant, at any stage of such action or proceeding and direct a stay of proceedings or suspend sentence pending the period of such commitment but not exceeding sixty days without a further order of the court.

3 Discharge. Whenever the medical officer of the institution, or if there be no medical officer, the superintendent, shall certify to the committing magistrate or court that any person so committed has been sufficiently treated, or give any other reason which is deemed by the magistrate or court to be adequate and sufficient, he may in accordance with the terms of commitment discharge the person so committed, or return such person to await the further action of the court, provided, however, that when such commitment is to an institution under the jurisdiction of the Department of Correction, or other similar department in a city of the first class, where there is a parole commission established pursuant to law, such commission shall act in the place and stead of a chief medical officer for the purpose of making such a certificate.

§ 439 Exceptions and exemptions not required to be negatived. In any complaint, information, indictment, or other writ or in any action or proceeding brought for the enforcement of any of the provisions of this article, it shall not be necessary to negative an exception or exemption, and the burden of offering proof of any such exception or exemption shall be upon the defendant.

§ 440 Enforcement. This article shall be enforced by the judicial and police authorities of the state and of the political subdivisions thereof engaged in the enforcement of the law. Such authorities and their agents shall have access at all times to all orders, prescriptions or records to be kept under this article.

§ 441 Possession at time article goes into effect. Habit forming drugs lawfully in the possession or under control of any person at the time this article goes into effect, may be possessed by him with the same effect as if obtained lawfully under this article.

§ 442 Penalties. A violation of any provision of this article shall constitute a misdemeanor.

§ 443 Constitutionality. If any provision of this article is declared unconstitutional or the application thereof to any person or circum-

good faith and in the course of his professional practice only, and not for use by a human being

2 Dentists A dentist, in good faith and in the course of his professional practice only, may administer or dispense habit forming drugs to patients under his immediate treatment

3 Physicians A physician, in good faith and in the course of his professional practice only, may prescribe, administer, or dispense habit forming drugs

§ 427 Prescription Any apothecary may sell or dispense habit forming drugs to any individual upon a written prescription of a physician, or veterinarian, dated and signed on the day when issued and bearing the full name and address of the patient and the name, address and registry number of the practitioner under the Harrison act if he is required by it to be so registered. The person filling the prescription must write the date of filling and his own signature upon the face of the prescription, and the prescription must be retained on file by the apothecary filling it for two years so as to be readily accessible for inspection, and it shall be subject to inspection by any public officer or employee engaged in the enforcement of this article. The prescription shall not be refilled

§ 428 Record to be kept 1 Physicians, dentists, veterinarians Every physician, dentist and veterinarian shall keep a record of all habit forming drugs administered or dispensed by him, except such as may be administered or dispensed to a patient upon whom he shall personally attend, showing the amount administered or dispensed

2 Manufacturers and wholesalers Manufacturers and wholesalers shall keep a record of the habit forming drugs received and disposed of by them

3 Exempted preparations and remedies Every manufacturer of exempted preparations or remedies shall keep a record of the amount of habit forming drugs received and of all sales of exempted preparations or remedies and every dealer therein shall keep a record of all sales of exempted preparations and remedies

4 Form and preservation Every such record shall be kept for a period of two years from the date of the transaction recorded, and a record required by or under the Harrison act, containing substantially the same information, shall be a compliance with this section. All records required by this section shall be readily accessible for inspection and shall be open to inspection by the proper authorities

§ 429 Labels Whenever an apothecary, pursuant to a written prescription, shall sell or dispense habit forming drugs or whenever a physician, dentist or veterinarian shall dispense any

of such drugs, he shall securely affix to the container of such drug a label stating in legible English the name and address of the physician or veterinarian prescribing or dispensing and of the apothecary or dentist dispensing, the date and the name and address of the person for whom or the owner of the animal for which the drug is dispensed

§ 430 Authorized possession of drugs by individual A person to whom or for whose use any habit forming drug has been sold or dispensed by an apothecary, physician or dentist, or the owner of an animal for which any such drug has been prescribed or dispensed by a veterinarian, may lawfully possess it in the container delivered to him by the person selling or dispensing same.

§ 431 Physical examination required A physician, dentist or veterinarian shall not administer, dispense or prescribe any habit forming drugs except after a physical examination of the person for whom or the animal for which the drug is intended

§ 432 Instruments for injection of habit forming drugs No person except a manufacturer or a wholesale or retail dealer in surgical instruments, apothecary, physician, dentist, veterinarian, nurse or interne shall at any time have or possess a hypodermic syringe or needle or any instrument or implement adapted for the use of habit forming drugs by subcutaneous injections and which is possessed for the purpose of administering habit forming drugs, unless such possession be authorized by the certificate of a physician issued within the period of one year prior thereto

§ 433 Exemption from restrictions 1 Common carriers, employees, public officers The provisions of this article restricting the possessing or having under control of habit forming drugs shall not apply to common carriers or warehousemen or their employees engaged in lawful transportation or storage of such drugs, nor to public officers or employees while engaged in the performance of their official duties, nor to temporary incidental possession by employees or agents of persons lawfully entitled to possession, or by persons whose possession is for the purpose of aiding public officers in the performance of their official duties

2 Interstate commerce This article shall not apply to acts done, or to habit forming drugs possessed in the course of interstate or foreign commerce

§ 434 Drugs delivered to the state hospital commission All drugs which have been seized and judicially determined to have been unlawfully possessed or the title to which has ceased and which have come into the hands of a peace officer shall upon the direction of a court or

the institution and opportunity for it to be heard, the commission having made a record of the proceeding upon such hearing, may, if the interest of the inmates of the institution so demand, for just and reasonable cause then appearing and to be stated in its order, amend or revoke any such license by an order to take effect within such time after the service thereof upon the licensee, as the commission shall determine. Any determination of the commission in respect to the revocation of a license shall be reviewable under certiorari proceedings by the supreme court or a justice therein instituted in the judicial district in which such institution is located. Violation of the provisions of this section shall constitute a misdemeanor, punishable on conviction by a fine of not less than one hundred dollars and not more than five hun-

dred dollars or by imprisonment for not less than sixty days or more than one year or by both such fine and imprisonment. The commission shall have power and authority over all such institutions as provided in this chapter in relation to private institutions for the insane.

§ 2 This act shall go into effect on the first day of January, nineteen hundred and twenty-six, except that applications for licenses may be made to the commission and the commission may make all necessary examinations and grant such licenses from the date on which this act becomes a law.

Assembly Int No 64—Concurrent Senate Int No 11 See Senate Bill for digest

Assembly Int No 120—A bill introduced in the Assembly by Assemblyman Joseph Reich of Kings County, would add new section 213, Labor Law, requiring employers to furnish nursing and first aid service in factories, mercantile and other establishments (Same as A Int No 309 of 1924)

Referred to Labor and Industries Committee

Int 120

IN ASSEMBLY,

January 13, 1925

Introduced by Mr Reich—read once and referred to the Committee on Labor and Industries—committee discharged, bill amended, ordered reprinted as amended and recommitted to said committee.

### AN ACT

To amend the labor law, in relation to furnishing nursing and first aid service in factories and in mercantile and other establishments

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Article seven of chapter fifty of the laws of nineteen hundred and twenty-one, entitled "An act in relation to labor, constituting chapter thirty-one of the consolidated laws," is hereby amended by inserting therein a new section to follow section two hundred and twelve, to be section two hundred and thirteen to read as follows:

§ 213 Nursing and first aid service In addition to the specific requirements prescribed by any provision of this chapter or of the industrial code in relation to the safety and sanitation of factories, mercantile establishments, mines, quarries, tunnels and other places, it shall be the duty

of every employer to furnish in or near any such factory, mercantile establishment, mine, quarry, tunnel or other place in which twenty-five or more persons are employed, nursing and first aid service under medical supervision for such length of time daily as may be prescribed by rule of the board. All nurses so furnished shall be registered nurses who have demonstrated their qualifications in industrial nursing to the satisfaction of the board of health of the city or town where they are employed. As part of such service medicines, dressings, bandages and implements sufficient to render first aid in cases of injury shall be supplied. The board shall adopt rules and regulations to carry into effect the provisions of this section.

§ 2 This act shall take effect immediately.

*Comment*—Inasmuch as this bill is the same as Assembly Int No 309 of last year, we repeat the comment that the bill is impractical as it burdens the populace directly and indirectly with a large tax. The medical profession is antagonistic in that its individual members could not enter into contracts to be present for certain fixed hours at the numerous manufacturing and other establishments which the law would require.

There are not enough registered nurses in the State nor could they be furnished before a number of years to be present even part of a day in more than a small percentage of the employments specified, to say nothing of physicians being tied up for a certain number of hours each day in compulsory attendance, according to their contract with the employers, by the terms of this bill.

Emergencies in health and accident cases in such establishments are now adequately provided for throughout the State within a reasonably short time.

stances is held invalid, the validity of the remainder of the article and the application thereof to other persons and circumstances shall not be affected thereby

§ 2 Section four-b of such chapter, as added by chapter five hundred and fifty-nine of the laws of nineteen hundred and thirteen is hereby amended to read as follows

§ 4-b Duties of commissioner with respect to laboratories 1 The commissioner of health shall establish and maintain one or more laboratories with such expert assistants and such facilities as are necessary for routine examinations and analyses, and for original investigations and research in matters affecting public health He shall have authority to make, at the expense of the state, such examinations and analyses at the request of any health officer or of any physician He may enter into contracts with laboratories in localities accessible to the various portions of the state for the prompt examination of specimens received from local health officers or physicians and for the immediate report thereon, at the expense of the state, provided that all such laboratories shall conform to standards of efficiency established by the public health council, and that no obligation shall be incurred by the commissioner in excess of the sums available therefor

*2 There shall be at least one laboratory analyst who shall examine and analyze all habit-forming drugs as defined in this chapter, submitted to him by an official of the state or of any political subdivision thereof, engaged in the enforcement of the narcotic drug control law or any law of similar purpose and who shall be detailed by the commissioner to aid any such official of the state and to give evidence in any proceeding on behalf of the state in connection with such enforcement*

§ 3 Section seventeen hundred and forty-six of the penal law as added by chapter one hundred and thirty of the laws of nineteen hundred and twenty-three and any and all acts inconsistent with provisions of this article are hereby repealed

§4 Article twenty-two of the public health law is renumbered article twenty-three

§5 This act shall take effect immediately

*Comment*—This is the same bill that was introduced last year and which was then favorably received by the medical profession Comment on the part of the individual members of the Medical Society of the State of New York is invited

Senate Int No 116—A bill introduced in the Senate by Senator Morton J Kennedy of New York, concurrent Assembly Int No 216, introduced in the Assembly by Assemblyman Morris Weinfeld of New York, would add new section 177, Insanity Law, requiring the licensing of private institutions for treatment of narcotic drug addiction

Referred to General Laws Committee of both Houses

Int 216

IN ASSEMBLY,

January 15, 1925

Introduced by Mr Weinfeld—read once and referred to the Committee on Judiciary

AN ACT

To amend the insanity law, in relation to licensing private institutions for the treatment of narcotic drug addiction

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Chapter thirty-two of the laws of nineteen hundred and nine, entitled "An act in relation to the insane, constituting chapter twenty-seven of the consolidated laws," is hereby amended by adding thereto a new section, to be section one hundred and seventy-seven, to read as follows

§ 177 Private institutions for the treatment of narcotic drug addiction No person, association or corporation shall establish or keep an institution for the care, custody or treatment for compensation or otherwise of any person for the habit of taking or using any narcotic drugs, including cocaine, opium, morphine, codeine, diacetyl morphine (heroin), cannabis indica, cannabis sativa, or any compound, manufacture, salt, derivative or preparation of any of them or any synthetic substitute of any of them identical in chemical composition, unless such institution holds a license for such purposes issued by the commission Every application for such a license shall be accompanied by a plan of the premises proposed to be occupied, describing the capacity of the buildings for the uses intended, the extent and location of grounds appurtenant thereto, and the number of patients proposed to be received therein, with such other information and in such form, as the commission may require The commission shall not grant any such license without first having made an examination of the premises proposed to be licensed, and being satisfied that they are substantially as described, and are otherwise fit and suitable for the purposes for which they are designed to be used, and that such license should be granted The commission may, at any and all times, examine and ascertain how far a licensed institution is conducted in compliance with the license therefor, and after due notice to

employment [Any such board of trustees may employ one or more school nurses, who] *Nurses so employed* shall be registered trained nurses and authorized to practice as such. Such nurses when so employed shall aid the medical inspector of the district and shall perform such duties for the benefit of the public schools as may be prescribed by such inspector.

[A medical inspector or school nurse] *Such physicians, surgeons, dentists or nurses* may be employed by the trustees or boards of education of two or more school districts, and the compensation *thereof* [of such inspector], and the expenses incurred [in making inspections of pupils] as provided herein, shall be borne jointly by such districts, and be apportioned among them according to the assessed valuation of the taxable property therein.

[In cities and union free school districts having more than five thousand inhabitants, the board of education may employ such additional medical inspectors as may be necessary to properly inspect the pupils in the school in such cities and union free school districts.]

[The trustees of a common school district or the board of education of a union free school district whose boundaries are coterminous with the boundaries of an incorporated village shall, in the employment of medical inspectors, employ the health officer of the town in which such common school district is located or the health officer of such union free school district, so far as may be advantageous to the interests of such district.]

§ 2 This act shall take effect immediately.

\* EXPLANATION—Matter in *italics* is new matter in brackets [ ] is old law to be omitted.

Comment—This bill has been introduced for a

number of years and has always died in committee and we can hope that it will have no better luck this year, but the unexpected sometimes happens so therefore, let us urge that every reader of this article get busy immediately and advise his legislative representative that unless the bill be revised so as to eliminate those features which provide for "advising, directing or providing for the correction and prevention of such disease or defects and of providing treatment for the same," the physicians cannot support it. We will advise you if the bill makes any progress, but do not wait for such advice before registering your opposition to it as it is now written.

Assembly Int No 152—A bill introduced in the Assembly by Assemblyman Morris Weinfeld of New York, would amend section 13, Workmen's Compensation Law, by striking out provision that claim for medical treatment shall not be valid against employer unless physician within 20 days following first treatment furnish report of injury.

Referred to Labor and Industries Committee  
(Same as A Int No 717 of 1924)

Comment—Later

Assembly Int No 184—A bill introduced in the Assembly by Assemblyman F A Miller of Kings County, would amend section 118, Workmen's Compensation Law, by authorizing physical examinations and practical tests of claimant to determine loss of use and proportionate loss of use of a member, result and test to be part of record. (Same as Senate Int No 468 of 1924)

Referred to Labor and Industries Committee

Comment—Later

### THE MEDICAL INSPECTION IN SCHOOLS BILL

Assembly Int. No 127—A bill introduced in the Assembly by Assemblyman Joseph Reich of Kings County, would amend sections 570, 571, Education Law, by providing that boards of education and trustees shall appoint physicians and dentists and may employ nurses for service in schools

Referred to Public Education Committee

Int 127

IN ASSEMBLY

January 13, 1925

Introduced by Mr Reich—read once and referred to the Committee on Public Education

#### AN ACT

To amend the education law, in relation to medical services in the schools of the state.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Sections five hundred and seventy and five hundred and seventy-one of chapter twenty-one of the laws of nineteen hundred and nine, entitled "An act relating to education, constituting chapter sixteen of the consolidated laws," as such chapter was amended by chapter one hundred and forty of the laws of nineteen hundred and ten, and as such sections were added by chapter six hundred and twenty-seven of the laws of nineteen hundred and thirteen section five hundred and seventy-one having been amended by chapter one hundred and eighty-two of the laws of nineteen hundred and sixteen, are hereby amended to read respectively as follows

§ 570 Medical [inspection] *services* to be provided Medical [inspection] *services* shall be provided for all pupils attending the public

schools in this state, except in cities of the first class as provided in this article Medical [inspection] *services* shall include the services of [a trained registered nurse, if one is employed, and shall also include such services as may be rendered as provided herein in examining pupils for the existence of disease or physical defects and in testing the eyes and ears of such pupils] *physicians, surgeons and dentists for the purpose of ascertaining the existence of disease or physical defects, of advising, directing or providing for the correction and prevention of such disease or defects and of providing treatment for the same* The *services of trained registered nurses shall be rendered in aid of such services*

§ 571 Employment of medical inspectors The board of education in each city and union free school district, and the trustee or board of trustees of a common school district, shall [employ, at a compensation to be agreed upon by the parties, a competent physician as a medical inspector, to make inspections of pupils attending the public schools in the city or district,] *appoint at such salary as such board of education, trustee or board of trustees shall determine, such physicians, surgeons, dentists and nurses as may be required to carry out the provisions of this article* One of the *physicians* so appointed shall be known as the *medical inspector of such city or district* It appointed by a board of education of a city such physician, surgeon, dentist or nurse shall reside within the city The *physicians, surgeons and dentists* so employed shall be legally qualified to practice *as such* [medicine] in this state, and shall have so practiced for a period of at least two years immediately prior to such

For the period of six months after the appointment of the additional member of the State Board of Medical Examiners, as provided by this act, upon application made in writing and the payment of a fee of ten dollars, the regents shall issue a license, without examination by the board of examiners, to such persons who are twenty-one years of age, of good moral character, and otherwise qualified in any one of the following

(a) Graduate after a resident course of two years of six months each, or twelve months altogether, in a school teaching chiropractic, who during the last five years immediately preceding and at the time of taking effect of this act have been actually engaged in the practice of chiropractic in this state

(b) Graduates after a resident course of three years of six months each, or eighteen months altogether, in a school teaching chiropractic, who during the last three years immediately preceding and at the time of taking effect of this act have been actually engaged in the practice of chiropractic in this state, and who have had a preliminary education of three years in high school work or its equivalent

(c) Graduates after a resident course of two years of four months each, or not less than nine months altogether, if taken continuously, in a school teaching chiropractic, who during the last ten years immediately preceding, and at the time of taking effect of this act, have been actually engaged in the practice of chiropractic in this state

Proof of the course of study, age and period of practice of each applicant, under subdivisions "a," "b" and "c" of this section, shall be made by the affidavit of the applicant filed with the regents, proof of the good moral character of such applicant shall be made by the affidavit of two reputable citizens, the certificate of the chiropractic school as to such applicant's resident course of study and graduation shall be *prima facie proof thereof*

§ 6 Qualifications of applicants for examination and licenses The board shall admit to the examination for license any applicant who shall have paid to the board of examiners an examination fee of twenty-five dollars and submitted satisfactory evidence verified by oath or affirmation that he possesses the following qualifications

1 That he is more than twenty-one years of age, and

2 That he is a person of good moral character, and

3 That he has a preliminary education equivalent to graduation from a four-year high-school course registered by the regents, or an education accepted by the regents as equivalent, provided

such course shall have included elementary biology, elementary physics, elementary chemistry as taught in secondary schools, and

4 That he has actually taken a resident course and graduated from a chiropractic school which maintained, during the time of his attendance, a resident course of study extending over a period of twenty-four months, during which course at least two thousand and one hundred hours of sixty minutes each of actual instructions were given, and which included in its curriculum all of the subjects specified in the next section

§ 7 Examination of applicants All applicants for examination for license shall be required to pass a written examination conducted in the English language in the following subjects Anatomy, including histology and embryology, hygiene and sanitation, including bacteriology, physiology, biological chemistry, including dietetics, diagnosis and symptomatology, pathology, chiropractic analysis, and science and practice of chiropractic The board of examiners shall submit to the regents, as required, a list of questions for examination in the subjects enumerated From these lists the regents shall select questions for all the subjects To entitle the applicant to a license he must pass the examination with a rating of at least seventy-five per centum in each subject

§ 8 Licenses On receiving from the board of examiners an official report that an applicant has successfully passed the examination and is recommended for license, the regents may issue to him a license to practice chiropractic in this state Every license shall be issued by the regents under seal, and shall be signed by the president and secretary of the board of examiners and by an officer of the regents Before any license is issued, it shall be numbered and recorded in a book kept in the regents' office and its number shall be noted in the license This record shall be open to public inspection and in all legal proceedings shall have the same weight as evidence that is given to a record of conveyance of land Any license under this act shall entitle the holder thereof to the use of the degree D C, or doctor of chiropractic

§ 9 Waiver of examination The regents may waive the examination of any applicant for license hereunder who presents satisfactory proof that he has been duly licensed as a practitioner in any other state of the United States having licensing requirements equal to New York State, upon such waiver and the payment of the fee of twenty-five dollars the regents may issue to him a license as provided in section eight of this act

§ 10 Registry of license Every licensed practitioner shall before beginning practice under his license, cause such license to be registered in the office of the clerk of the county in which his

- " 11 Display of license and evidence of registration
- " 12 Rights of licensed practitioners
- " 13 Revocations and cancellation of licenses
- " 14 Proceeding for revocation
- " 15 Fines and penalties
- " 16 Violations

Section 1 Definitions As used in this act, "Regents" means board of regents of the University of the State of New York "Society" means New York State Chiropractic Society, Incorporated

"Board" means the state board of medical examiners of the State of New York, as provided in section one hundred and sixty-two of the public health law, as modified by this act

"Chiropractic school" means any school, college or department of a university teaching and giving instructions in the subjects required for a proper chiropractic standard as herein defined, which schools, upon making proof of giving such teaching and instruction may be registered and approved by the regents

"Proper chiropractic standard" means a course of study extending over a period of twenty-four months, during which an aggregate of at least two thousand one hundred hours of sixty minutes each of instruction is given in the following subjects Anatomy, including histology and embryology, hygiene and sanitation, including bacteriology, physiology, biological chemistry, including dietetics, diagnosis and symptomatology, pathology, chiropractic analysis, and science and practice of chiropractic

"Practitioner" means one who practices chiropractic

"License" means a license granted and issued by the board of regents of the University of the State of New York under this act to practice chiropractic within this state

"Licensed practitioner" means one who has received a license and is entitled to practice chiropractic within this state under the provisions of this act

The practice of chiropractic is defined as follows A person practices chiropractic within the meaning of this act, who holds himself out as being able to locate and to adjust by hand misaligned or displaced vertebrae of the human spine, for the purpose of relieving nerve pressure caused thereby

§ 2 The society The New York State Chiropractic Society, Incorporated, is continued, and the officers thereof shall be entitled to hold offices until the expiration of their respective terms and the elections and qualification of their successors, but the existence of said society shall in no way affect the validity of this act

§ 3 Board of examiners, organization Within twenty days after the first one hundred licenses have been issued under this act, the regents shall appoint one of such licensees as an additional member of the State Board of Medical Examiners Such appointee shall not be a medical doctor Before entering upon his term of office such examiner shall file with the Secretary of State his oath of office The terms of office shall be three years Before the day when the official term of a member of the board shall expire, the regents shall appoint his successor to serve for the term of three years Such appointment shall be made from the licensed and registered chiropractors of the state The regents in the same manner shall also fill vacancies in the board Such appointee shall not be a doctor of medicine Cause being shown before them, the regents may remove an examiner from office on proven charges of gross misconduct or neglect of duty

§ 4 Powers of the board 1 Any member of the board may administer oaths, summon witnesses and compel their attendance, and take testimony concerning any matter within the jurisdiction of the board

2 The board of examiners shall, by a majority vote of its members, subject to the approval of the regents, make such rules and regulations, not inconsistent with law, as may be necessary for the proper performance of its duties

3 The board of examiners shall have charge of the preparation and grading of examination papers required by this act, which examination shall be uniform in respect of subjects required of applicants for license to practice medicine, and shall hold examinations in at least four places in the state during each calendar year

4 The board shall, after a hearing, upon notice given, recommend to the regents the suspension or revocation of the license of a practitioner and the suspension or annulment of his registration, for any misrepresentation or false or fraudulent statement in his application or examination for a license, for his conviction of a crime involving moral turpitude or for a violation of any of the provisions of this act Upon such recommendation being made the regents may suspend or revoke such license and may suspend or annul such registration Whereupon the practitioner must surrender his license to the regents, who shall certify the facts to the county clerk of each county in which the practitioner is registered

5 The board may investigate violations of the provisions of this act and conduct hearings in respect thereto, when, in its discretion, it appears to be necessary, and to bring the same to the notice of any state or county official

§ 5 Present practitioners exempt from examination

registration has been annulled, and said clerk shall upon receipt of said certificate, file the same and forthwith mark said registration "annulled." Any person who shall practice chiropractic after his registration has been marked "Annulled" shall be deemed to have practiced without registration.

§ 15 Fees and penalties All fees, fines, penalties and other moneys derived from the operation of this act shall be paid into the state treasury and the legislature shall annually appropriate for the department an amount sufficient to pay all proper expenses incurred by them in administering this act, including the salary and expenses of the board.

§ 16 Violations Any person who shall violate any of the provisions of this act shall be guilty of a misdemeanor. Any person not duly licensed under this act who engages in the practice of chiropractic shall be guilty of a misdemeanor.

§ 17 In effect This act shall take effect January first, nineteen hundred and twenty-six.

*Comment*—This is the same bill, with a few modifications, that was introduced last year. The comment that was then made is, therefore, still forcibly applicable. In addition, however, it might be well to notice that in Section 3 it specifically states that the member of the society who is to be appointed to the examining board, *shall not be a doctor of medicine*. In Paragraph 3, under Section 4, an effort is made to represent the qualifications of the applicant for examination as equal to those of the applicant for examination for a license to practice medicine, when they use this sentence—"Which examination shall be uniform in respect of subjects required of applicants for license to practice medicine." In Section 5, three classes of persons now engaged in the practice of chiropractic are described and listed to be licensed without examination. The distinction between the classes is not clear in each instance, but the description is interesting, as is also the statement of the qualifications to be

presented by the applicant for examination as shown in the next Section.

We would also have you note the variety of subjects the applicant is to be examined in, as outlined in Section 7. Among these you will see bacteriology listed, and you may wonder how a knowledge of this subject will aid one in becoming a practitioner of chiropractic which they define as follows: "A person practices chiropractic within the meaning of this act, who holds himself out as being able to locate and to adjust, by hand, misaligned or displaced vertebræ of the human spine, for the purpose of relieving nerve pressure caused thereby."

Of course, to those succeeding in passing the examination, the bill would grant degree of "D C" or doctor of chiropractic, and to continue their semblance of regularity, in Section 10 it is provided that "Chiropractors shall annually register under the provisions of the amendment to the medical act requiring all licensed physicians to annually register." But finally, after having so diligently outlined the course of study that applicants for a degree must take, in anatomy, including histology and embryology, hygiene and sanitation, including bacteriology, physiology, biological chemistry, including dietetics, diagnosis and symptomatology, in Section 13, paragraph "C," they state that "The regents may revoke the license of a practitioner, or annul his registration, or both, *who prescribes or administers drugs or practices surgery or obstetrics*."

It now behooves every practitioner who reads this comment, to get in touch immediately with his legislative representatives and impress upon them the necessity of killing a bill that would thus admit most inadequately prepared persons to engage in a form of medical practice, even though it may be limited to manipulation of bony protuberances.

---

## THE NARCOTIC BILL

Assembly Int No 215—Concurrent Senate Int No 115 See Senate bill for digest and comment

Assembly Int No 216—See concurrent Senate Bill Int No 116 for digest and comment

practice is to be principally carried on, in a book to be provided by the clerk for such purpose, in which shall be entered the name, residence, place and date of birth, number and date of license and an affidavit signed by such licensed practitioner verified before such clerk to the effect that he is the person named in the license, and has complied with all of the provisions of this act. The clerk shall indorse upon such certificate the date and his name, preceded by the words "registered to practice chiropractic, in the clerk's office of \_\_\_\_\_ County".

The clerk shall thereupon give to the licensed practitioner so registered a certified transcript under his official seal of the entries in the register. The county clerk shall be paid a fee of one dollar for registration, affidavit and certificate. If the registration of the practitioner be suspended or annulled by the regents, upon receipt of a certificate to that effect the clerk shall stamp upon the record of registry "registration suspended" or "registration annulled" as the case may be, with the date of suspension or annulment. If such registration be thereafter reinstated the clerk shall note that fact on the registration record. If a registered practitioner remove his office or maintain an office in another county he shall register also in such county and notify the board of such fact. He shall present a transcript of registration and pay a fee of twenty-five cents, whereupon the clerk shall indorse thereon "registered also in \_\_\_\_\_ county". "Chiropractors shall annually register under the provisions of the amendment to the Medical Act requiring all licensed physicians to annually register."

§ 11 Display of license and evidence of registration. Each licensed practitioner must at all times keep conspicuously displayed in his principal business office his license and registration certificate and in any office in which he practices chiropractic his county registration certificate. Every unrevoked license with indorsement of registry thereon shall be presumptive evidence in all courts and places that the person named therein is legally licensed and registered under the provisions of this act.

§ 12 Rights of licensed practitioners. Each duly licensed practitioner who shall have fully complied with all provisions of this act, shall have the right to practice chiropractic within this state and shall be subject to all the disabilities, limitations and restrictions and entitled to the civil rights, privileges and immunities imposed upon and granted to all professional persons by the civil practice act and the judiciary law.

§ 13 Revocation and cancellation of license. The regents may revoke the license of a practitioner or annul his registration, or both, in any of the following cases:

(a) A practitioner who is guilty of any fraud

or deceit in his practice, or who is guilty of any fraud or deceit by which he was admitted to practice, or

(b) To an habitual drunkard or habitually addicted to the use of morphine, opium, cocaine, or other drugs having similar effect, or

(c) Who prescribes or administers drugs, or practices surgery or obstetrics, or

(d) Who undertakes to engage in any manner or by any ways or means whatsoever, to procure or perform any criminal abortion as the same is defined by section eighty of the penal law, or

(e) Who offers or undertakes by any manner or means to violate any of the provisions of section eleven hundred and forty-two of the penal law.

§ 14 Proceeding for revocation. Proceedings for revocation of a license or the annulment of registration shall be begun by filing a written charge or charges against the accused. Those charges may be preferred by any person or corporation, or the regents may on their own motion direct a member of the board of examiners to prefer said charges. Said charges shall be filed with the secretary of the board of examiners. The board of examiners shall hear and determine said charges. A time and place for the hearing of said charges shall be fixed by said board as soon as convenient, and a copy of the charges, together with a notice of the time and place when they will be heard and determined, shall be personally served upon the accused or his counsel, at least ten days before the date actually fixed for said hearing. Where personal service upon counsel cannot be effected, and such fact is certified on oath by any person duly authorized to make legal service, the board shall cause to be published, in the manner prescribed for the service by publication of a summons, a notice to the effect that at a definite time and place a hearing will be had for the purpose of hearing charges against the practitioner upon an application to revoke his license. At said hearing the accused shall have the right to cross-examine the witnesses against him and to produce witnesses in his defense, and to appear personally or by counsel. The said board shall make a written report of its findings and recommendations and the same shall be forthwith transmitted to the executive officer of the board of regents. If the said board shall find that said charges, or any of them are sustained, and shall recommend that the license of the accused be revoked or his registration be annulled, the regents may thereupon, in their discretion, revoke said license or annul said registration, or do both. If the regents annul such registration they shall forthwith transmit to the clerk of the county or counties in which said accused is registered as a practitioner, a certificate, under their seal, certifying that such

## PERIODIC HEALTH EXAMINATIONS IN NEW YORK COUNTY

Lectures in a symposium on Periodic Health Examinations are held in the Academy of Medicine, New York City, on Tuesday and Thursday afternoons at four o'clock, as announced on page 34 of the last week's JOURNAL.

Eight lectures have already been given, with an average attendance of over two hundred. We printed the first lecture in last week's issue, and are now printing the seventh one of the series. F O

## PRE-CLINIC SIGNS OF DISEASE OF THE GENITO-URINARY SYSTEM

By EDWARD L. KEYES, M.D.,

Abstract of the seventh lecture in the symposium on Periodic Health Examinations given in the New York Academy of Medicine on January 15, 1925, under the auspices of the Medical Society of the County of New York.

The term "Pre-clinical" as applied to signs of disease is somewhat contradictory, unless we mean the recognition of a disease before it reaches a state that sends the patient to bed. What we mean by the term "Pre-clinical Signs" is the earliest possible signs by which we can recognize approaching disease. In one sense a sign that is present at all is already a sign of clinical disease. What we try to do is to recognize the disease while it is in the curable stage.

Why are so many diagnostic mistakes made? The answer is *insufficient examinations*.

Two time-honored diagnostic procedures are now often omitted, first, a rectal examination, and second, what the old physicians called uromancy, or the inspection of the urine.

Dr. Osler insisted that a general physical examination always includes an exploration of the rectum with the finger. This procedure is of special importance in making a genito-urinary examination. Not only will it reveal conditions in the prostate, but a bimanual examination made after the manner of that in gynecology will reveal tumors of the bladder.

The appearance of the urine is often overlooked as the physician receives a sample that is camouflaged in a pretty wrapper, and is viewed by the laboratory technician through various glasses. Looking carefully at the urine is of the first importance in making a genito-urinary examination.

A successful examiner has a gift for choosing those examinations which will reveal the essential facts of the case. For example, a man recently had what appeared to be grippe, but his urine had a bad odor and a muddy appearance. After a week of treatment he was referred to the specialist for a cystoscopic examination. There were 300 c. c. of

residual urine, but nothing special was found in the bladder, and the ureters were not catheterized. A diagnosis of cystitis was made, and bladder washings were advised. On the insistence of the family physician the ureters were afterward catheterized, and very little wrong was found. The urine was then cultured, and paratyphoid bacilli in pure culture were found. In this case the clinical conclusion was right, although the diagnosis was wrong. This is an illustration of wabbling judgment until the right key to the condition is found.

A skilled examiner will get at a diagnosis by seeing the striking symptoms of a condition. Take tuberculosis, for example. Twenty years ago a demonstrator would have had to put up a long argument to convince even a specialist that painful and frequent urination, long continued, pointed directly to tuberculosis of the kidney, but now that fact is so well known that few cases of kidney tuberculosis reach the genito-urinary specialist, because the general surgeons recognize the symptoms and get the cases. These signs would have been called pre-clinical signs twenty years ago, but they are now recognized as those of a fully developed disease.

Hematuria that is transient and brief, and occurs in an adult, may be classed as a pre-clinical sign that suggests a malignant tumor of the kidney or bladder. Our knowledge of urinary tumors is now in the same stage that our knowledge of tuberculosis of the kidney was twenty years ago. A malignant growth of the genito-urinary tract diagnosed early can be cured by surgical means. There is no need that a patient who passes blood should run away from the doctor in a deadly fear.

While casts are of great importance in the diagnosis of toxic nephritis, they are of little

# State Department of Health

## INFECTIOUS JAUNDICE

District State Health Officer Sayer reports an investigation of a small outbreak of infectious jaundice in the town of Denmark, Lewis County. Five cases were called to his attention, all in children of 5 to 14 years. Three of the children attended a single school and the two other cases were in the family of one of the three school children. None were very sick. All had the characteristic symptoms—nausea, vomiting, abdominal pain and jaundice. One had hiccough lasting several hours.

This outbreak is of interest, as Dr. Sayer states that there have been cases in the locality for the past two or three years.

## "PTOMAININE POISONING" AGAIN USED INCLUSIVELY

On questioning a death reported as due to "ptomaine poisoning," the Division of Communicable Diseases learned that the patient, a boy of 16, on returning from a Boy Scout Camp and finding nobody at home, ate a large dish of yellow beans which had turned sour. That night and the following day he vomited frequently and had cramps. The next day, bile, mucus, water and particles of food (beans) were vomited. Abdomen was tender, but not distended. In the evening of the following day there was an "offensive bowel movement." On the next afternoon he was able to retain a little fluid, and became more cheerful. At 11 P. M. he had severe intermittent cramp-like pains in his abdomen and was suffering with shock. He died a few hours later. Autopsy revealed volvulus of small intestine close to caecum, causing obstruction. The volvulus was stated to have been caused by a diverticulum of the ileum 60 cm above the caecum. In spite of these findings the death was certified as being due to "ptomaine poisoning."

## DEATH REPORTED FROM MUSHROOM POISONING

An unusual type of mushroom poisoning has been reported by the Grasslands Hospital, Valhalla.

The patient, an Italian, age 29, ate mushrooms at dinner on August 31. The next morning, at 6 A. M., he began to cough, then had pain in epigastrium (left upper quadrant) and vomited. On September 5 he entered the hospital and reported that he had been short of breath and very thirsty since the onset, had been continually nauseated and had vomited a few times.

Physical examination showed an intense jaun-

dice. The patient complained of a good deal of pain and nausea on pressure over the mid-epigastrium. The liver was felt 2 cm below the costal border, but not tender. Knee jerks were absent. On September 7 he became weaker. Blood was present in the stools and bile in the urine. Red cell count was 4,500,000. He was treated by hypodermoclysis of normal salt solution and 5 per cent glucose. Blood was typed and a donor secured for transfusion. The patient died before the operation could be undertaken.

Autopsy showed diffuse and coalescent liver necrosis, multiple punctiform subserous hemorrhages of peritoneum, pleura, epicardium and endocardium, hemorrhage into rectus muscle, cloudy swelling of kidney, congestion of viscera and icterus.

According to Ford's classification, the picture presented in this case most nearly fits the rare variety of mushroom poisoning known as *Mycetismus Sanguinarius*. The only mushroom producing this type of poisoning is said to be the "*helvella esculenta*" (*gyromyza esculenta*) which contains a heat resistant hemolytic poison, "helvellic acid."

\* Transactions of Assn. of Am. Phys., Vol. XXVIII, 1923 p. 225

## AN UNUSUAL CASE OF ANAPHYLAXIS

The following instance of anaphylaxis, reported by a city health official, is of unusual interest because of the length of time intervening since the previous administration of antitoxin.

"Last Wednesday, about 9 P. M., I was called by a physician to see a girl of 13 that he had just been called to see, and that he thought might have diphtheria. I gave a clinical confirmation and took cultures and smears, both of which were positive the following morning. As the doctor was unprepared, he asked me to proceed with the administration of antitoxin. On taking a brief history, I learned that the child had had an immunizing dose of antitoxin about ten years previously. Accordingly, I did an intracutaneous test first with a drop or two of antitoxin. In fifteen minutes, there was an area of marked erythema about five centimeters in diameter around the point of injection. I therefore proceeded to desensitize her and administered 6,000 units subcutaneously in about two hours. Because of the presence of membrane on both tonsils, I wanted to give her 12,000 units and, it being near midnight, and having had no trouble with the first 6,000, I thought it would be safe to give her the remaining 6,000 at one time. I injected it slowly, intramuscularly, in the usual way. I had no more than gotten to the bathroom to wash out my syringe when I heard the girl cry to her father that her face felt 'funny.' By the time I reached her bedside in the front room, she was as red as a broiled lobster from head to foot, was dyspneic, and nauseated, and the pulse was slow and intermittent. Luckily, I had some epinephrin solution in my bag and I immediately injected 1 cc. of a 1-10,000 solution. In about five minutes, everything was calm again."

## MEDICAL SOCIETY OF THE COUNTY OF MONTGOMERY

The annual meeting was held at the Elks' Building, Amsterdam, N Y, on the evening of December 10, 1924

Present Drs Phillips, Ormsby, Hicks, Qua, Bing, Timmerman, Tomlinson, Homrighouse, Canna, Pierce, LaPorte, Simpson, FitzGibbons, Stover, Walton, Wilson, Bouton, Seward, Lombardi, Schiller, Collier, Sherburne, of Amsterdam, N Y, and Dr Howard of Minaville, Dr Fox of Canajoharie, Drs James N Vander Veer and Joseph S Lawrence, of Albany

Dr C F Timmerman, who had been treasurer for some number of years, had an extensive report showing that all members of the County Society had paid up in full, and a splendid balance was in the treasury On motion of Dr R R Canna of Amsterdam, N Y, a rising vote of thanks was given Dr Timmerman for the able manner in which he had conducted the office of treasurer

Dr Bing, the chairman of the Censors, reported the following names for applications for membership Dr Baron Shults, of St Johnsville, N Y, and Dr Douw S Myers, of Tribes Hill, N Y They were acted upon favorably by the Censors and a motion made by Dr Julius Schiller, of Amsterdam, N Y, that Dr Myers and Dr Shults be made members of the Medical Society of the County of Montgomery

On motion of Dr E Harrison Ormsby, of Amsterdam, N Y, a motion was made and seconded that we dispense with the regular order of business and proceed with the scientific program, which consisted of an informal talk on the "Opportunity of the County Society," by Joseph S Lawrence, M D, executive officer of the Medical Society of the State of New York, "Function of the Legislative Committee," by James N Vander Veer, M D, chairman of the Legislative Committee of the Medical Society of the State of New York

The report of the committee on Periodical Examination was quite an exhaustive report The committee was composed of Drs Stover, LaPorte, Collier and Simpson, of Amsterdam, N Y, and Dr Howard of Minaville, N Y

On motion of Dr H M Hicks, which was duly accepted, a vote of thanks was extended to the committee for the excellent report presented to the Society

The following officers were elected for 1925 James S Walton, president, E Harrison Ormsby, vice-president, William R Pierce, secretary, Seymour L Homrighouse, treasurer, Censors, Drs Timmerman, LaPorte and Bing, of Amsterdam, N Y

---

## OTSEGO COUNTY MEDICAL SOCIETY

The annual meeting of the Otsego County Medical Society was held in the Elk's Home, Oneonta, N Y, on Tuesday, December 9, 1924

In the absence of both president and vice-president, Dr J C Smith was made chairman of the meeting

The following officers were elected for 1925 President, John Walter Swanson, M D, Springfield Center, vice-president, Rupert W Ford, M D, Otego, secretary, Arthur H Brownell, M D, Oneonta, treasurer, Frank L Winsor, M D, Laurens, delegate to State Society meeting, Addison H Bissell, of Cooperstown

An important change was made in the time and number of meetings Four meetings will be held each year, the second Tuesday of March, June, September and December The hour to be at 4 30 P M, in place of the morning and afternoon meetings as heretofore The first two meetings of the year to be in Cooperstown, and the second two in Oneonta

Drs Marv, Parish and Bissell submitted the following resolution in regard to the death of Dr Cutler

"The Otsego County Medical Society desires to record permanently its sense of great loss in the death of Dr

Arthur W Cutler The Society feels his death affects not only the Society and the medical profession, but the community at large, and offers this tribute to his memory"

Dr J C Smith gave a report of the Sixth District Convention Dr J S Lawrence, executive officer of the State Medical Society, addressed the meeting in behalf of better co-operation between the State and County societies

Lunch was served in the Palm Room, with twenty-four men present

In the scientific session, Dr M E Brownell presented the subject of "Herpes in Relation to the Face and Eyes," showing that there has been in and about Oneonta an epidemic of this condition for some months A general discussion followed, as many physicians had met with a similar condition

Dr Bissell gave a paper on "The More Common Symptoms of Urological Conditions"

Dr Herman F Senftner, of the State Health Department, gave a very helpful talk on "Prophylactic Immunization," showing the great advance that is being made along the lines of preventive medicine

Dr L W Hubbard, of the State Department of Health, was a guest of the Society

importance in surgical nephritis. A kidney in which bacilli grow does not seem to form casts, but the toxic substances may cause nephritis with casts in the other kidney.

It is important to recognize cancer of the prostate early, for it can be cured by surgery in its early stages. An accidental symptom may lead to an examination and a correct diagnosis. For example, several years ago a man 60 years of age complained of painful, frequent urination, but an examination, including a rectal one, revealed nothing. Recently he returned with the same symptoms, and a finger in the rectum felt a small lump. The cystoscope showed a slight old granulation of the verumontanum, which was harmless, and yet had caused all the symptoms which impelled the patient to go to his doctor, and which led to a cure of his cancer.

There is need that all available means of diagnosis be used. A diagnosis of cancer of the prostate was made on a prominent patient as the result of a rectal examination, but the relations with the patient were such that the physician feared to tell the patient, and so he suggested a further examination with the X-ray. This revealed several stones in the prostate, and their removal resulted in a complete cure.

Stones or concretions in the prostate are nearly always composed of lime, and so cast clear-cut X-ray shadows.

A general rule in the interpretation of the results of rectal examinations is that hard lumps that are felt are not located in the prostate, but are around it, while soft spots are likely to be located in the prostate itself.

## BRONX COUNTY MEDICAL SOCIETY

The annual meeting of the Bronx County Medical Society, held at Concourse Plaza, on December 17, 1924, was called to order at 9 P M, the President, Dr Podvin, in the chair.

The minutes of the last regular meeting and of the annual meeting of the Comitia Minora were read for the information of the society.

The following applicants for membership were elected: Louis Breinin, Charles E Haynes, C Austin Kosik, Michael J Lynch, Solomon Just Rosenberg, Philip Sacks, Abraham B Tamis, Dorean D Wyser.

It was moved and carried that Dr Allen K Krause, of Johns Hopkins University, be elected honorary member.

Election of officers, censors and delegates for the year 1925 being in order, the president declared the polls open at 9 15 P M. Drs Landy, Hayward, Burstan and Keller were appointed as tellers.

A ten minute recess was ordered.

The reports for the year 1924 of the following officers and committees were presented:

Treasurer, Dr Keller

Committee on Audit, Dr Bookman

Secretary, Dr Landsman

Board of Censors, Dr Leimer

Counsel, Mr McChristie

Committee on Membership, Dr Nisselson

Committee on Public Health, Dr Friedman

Committee on Medical Economics, Dr Lukin

Milk Commission, Dr Rost

Committee on Legislation, Dr Cunniffe  
Special Committee on New Members, Dr Smiley

Bulletin Committee, Dr Eichler

It was moved and carried that a vote of thanks be extended to our counsel, Mr McChristie, for his work on behalf of the society.

The president declared the polls closed at 10 30 P M. The tellers reported, and the following candidates were then declared elected: President, Simon M Jacobs, First Vice-President, Edward R Cunniffe, Second Vice-President, I H Goldberger, Secretary, I J Landsman, Corresponding Secretary, Samuel F Weitzner, Treasurer, J Adlai Keller, Board of Censors, Harry Aranow, Joseph H Gettinger, Delegates, J Lewis Amster, William Meddaugh Dunning, Cornelius J Egan, Edmund E Specht, Alternates, Vincent S Hayward, J Adlai Keller, Nicholas Lukin, Irving Smiley, Alternate (1 year), William Klein.

The scientific program then proceeded as follows:

1 "Cutaneous Tuberculosis" (with lantern slides demonstration), Adolph Rostenberg. Discussion by Drs Feldman and Horwitt.

2 "Local Anæsthesia" (with lantern slides), William Klein. Discussion by Drs Amster, Diem and Solkow.

3 "Ocular Headaches," David A Newman. Discussion by Drs Jaffe and Rosenbluth.

The meeting adjourned at midnight.

## RICHMOND COUNTY MEDICAL SOCIETY

A regular meeting of the Richmond County Medical Society was held at the Staten Island Academy on Wednesday, November 12, 1924. The meeting was called to order at 9 p m with Dr Presley in the chair. Those present were Drs Presley, Catalano, Walsh, O'Reilly, Hetzel, Lucy, Smith, Jessup, Rieger, Pearson, Washington, Kingsley, Kreuger, Freidel, Craig, McGowan, Mord, Coonley, Reigi, Klauber, Timpone, Harwood, Law, Halbert, Buntin, Walrath.

Dr Pearson spoke on the inconvenience of attending meetings of the Compensation Commission, from the standpoint of the patient and physician. A motion was made that a committee be formed to petition in proper form that the Compensation Commission hold meetings periodically in this Borough. Dr Pearson, Chairman, assisted by Drs Hetzel and Lucy.

Dr Lavender, of the Public Health Service, spoke on the plans for the enlargement of the Marine Hospital from three hundred to five hundred beds. A motion was made that the Richmond County Medical Society go on record as approving the plans of the Public Health Service for enlarging the Marine Hospital at Stapleton.

James Alexander Miller, M D, spoke on the "Treatment of Pulmonary Tuberculosis by Artificial Pneumothorax and Surgical Collapse." Dr Miller laid marked emphasis on the fact that one must not forget the patient is being treated primarily for tuberculosis, therefore the treatment is rest, adding to that the immobilization of the lung. Pneumothorax is used in selective cases, particularly extensive active unilateral tuberculosis, but it may also be used for the control of hæmorrhage, acute unilateral pneumonic phthisis (where it gives the only hope), and unilateral cases which do not respond to bed rest. It may also be used early for short periods to

get rid of constitutional symptoms. An active lesion below the level of the second rib contraindicates pneumothorax of the opposite side.

Among the accidents attending pneumothorax mentioned by Dr Miller are puncture of the lung, collections of fluids going to tuberculous empyema, which, except in a few cases, does no harm, secondary infection of the fluid, which is serious, sudden death in a few cases, probably due to shock.

Adhesions in chronic cases of tuberculosis constitute a great difficulty as it prevents the full collapse of the lung. In these cases the adhesions may be cut by cautery under a cystoscopic-like instrument or the paralysis of half of the diaphragm may be brought about by cutting the phrenic nerve, or a more radical operation may be done.

Dr Miller showed a series of lantern slides illustrating some of his cases and the methods of treatment. Discussion was opened by Dr Timpone. A vote of thanks was tendered to Dr Miller for his interesting and instructive paper.

Dr Kingsley and Dr Harwood gave case reports of patients treated by artificial pneumothorax. Dr Kremer, superintendent of Seaview Hospital, spoke of his experience with pneumothorax at that hospital. Dr Patton spoke on the use of heliotherapy at Seaview Hospital.

The following officers were nominated for the year 1925: President, E W Presley, Vice-President, Wm R Janeway, Secretary, Charles Rieger, Treasurer, E D Wisely, Censors, Wm Bryan, Frederick Schwerd, George Walrath, Delegates, E W Presley, Charles R Kingsley, Alternate Delegates, Charles Nichols, D V Catalano.

The meeting adjourned at 10 45 to the Staten Island Club.

---

## CHENANGO COUNTY MEDICAL SOCIETY

The 120th annual meeting of the Chenango County Medical Society was held at Guernsey Memorial Library, Norwich, on Tuesday, December 9, 1924.

The following officers were elected for 1925: President, James B Noyes, M D, New Berlin, vice-president, Thomas F Manley, M D, Norwich, secretary-treasurer, John H Stewart, Norwich.

President's address: William E Hartigan, M D, Norwich.

"Relation of Hospital to Community," Miss Frances Higgins, Superintendent, Norwich Memorial Hospital.

"Sepsis," Thomas Manley, M D, Norwich.

"Diphtheria Prevention," F O Rinehard Oneonta.

## THE MEDICAL SOCIETY OF THE COUNTY OF QUEENS

At the annual meeting of the Medical Society of the County of Queens, held November 25, 1924, the following officers were elected for 1925: Henry C. Courten, president, Dennis Edward McMahon, vice-president, Joseph S. Thomas, secretary-treasurer, Edward Albert Flemming, Thomas Clark Chalmers, and Henry W. Kemp, censors, J. Howard Morse, Henry C. Courten, and Thomas C. Chalmers, delegates to the State Society, Ernest E. Smith, James Risley Reuling, Jr., Charles W. Martin, and George J. J. Lawrence, alternate delegates, Carl Boettiger, trustee, and Duncan Macpherson, historian.

The following members were elected: Otto Gitlin, M.D., Jamaica, and E. J. Carey, M.D., Flushing.

Dr. H. C. Courten, for the Comitia Minora, offered a resolution intended to put the Society on record as opposed to the exhibition, in connection with physicians' signs, of the specialty in the practice of which they may be engaged. This resolution aroused an active discussion, and the final decision was postponed until the next meeting, and the secretary was instructed to print

the resolution in the notices of the next meeting. The secretary-treasurer read his annual report, which showed 242 members. The trustees reported that owing to delay in grading of the Boulevard, it is impossible to form definite plans for the new building.

At the scientific session, the first paper, entitled "Topographic Changes in the Thorax of the New-born," by G. J. Noback, M.D., Assistant Professor of Anatomy at the New York University and Bellevue Hospital Medical College, was an analytical study of 65 cadavers of fetuses and new-born with special reference to the anatomy of the Thymus gland. The second paper, by John Van Doren Young, M.D., entitled "The Present Status of Retroversion," was an able and thorough exposition of the author's views on the subject. He emphasized the importance of careful study of patients and in the matter of operative technique attached great importance to the utero-sacral ligaments, in shortening the round ligaments preferred one of modifications of Gillian's operation, and advised the preliminary treatment of the cervix, where indicated, by means of intermittent hyperemia or by means of the cautery.

## ROCKLAND MEDICAL SOCIETY

The annual meeting and dinner of the Rockland County Medical Society was held in The Elms at New City, the County Seat, on Wednesday afternoon, December 3, 1924, with practically every member present. The total number of those who sat at the tables was forty-seven, including guests. The meeting was enlivened by two song leaders and entertainers from New York City.

Dr. Ralph O. Clock, in his presidential address, suggested that the annual dues be raised from two dollars, as at present, to five dollars, in order to provide funds for an extension of the work of the Society, especially publicity and education of the people. The meeting unanimously adopted the raise in dues.

Dr. E. A. Whitney, of Suffern, was duly elected to membership.

The former officers were re-elected, as follows: President, Dr. R. O. Clock, vice-president, Dr. Royal Sengstacken, secretary, Dr. R. R. Felter, treasurer, Dr. Dean Miltemore.

The following chairmen of standing committees were also elected: Membership, Dr. G. F. Blanvelt, legislation, Dr. C. D. Kline, civic policy, Dr. J. C. Dingman.

The principal address was given by Dr. S. Dana Hubbard, Director of the Bureau of Public Health Education of the Department of Health of New York City, who told of the constant work of the department in the control of vendors of proprietary and patent medicines, and in the detection and exposure of illegal practitioners and quacks. He emphasized the necessity that the health department and the prosecuting attorney should have the backing of a people who are educated by the physicians to know quackery when they see it.

Dr. Frank Overton, executive editor of the NEW YORK STATE JOURNAL OF MEDICINE, gave some suggestions for the education of the people in medical subjects.

F O

## RICHMOND COUNTY MEDICAL SOCIETY

A regular meeting of the Richmond County Medical Society was held at the Staten Island Academy on Wednesday, November 12, 1924. The meeting was called to order at 9 p m with Dr Presley in the chair. Those present were Drs Presley, Catalano, Walsh, O'Reilly, Hetzel, Lucy, Smith, Jessup, Rieger, Pearson, Washington, Kingsley, Kreuger, Freidel, Craig, McGowan, Mord, Coonley, Reigt, Klauber, Timpone, Harwood, Law, Halbert, Buntin, Walrath.

Dr Pearson spoke on the inconvenience of attending meetings of the Compensation Commission, from the standpoint of the patient and physician. A motion was made that a committee be formed to petition in proper form that the Compensation Commission hold meetings periodically in this Borough. Dr Pearson, Chairman, assisted by Drs Hetzel and Lucy.

Dr Lavender, of the Public Health Service, spoke on the plans for the enlargement of the Marine Hospital from three hundred to five hundred beds. A motion was made that the Richmond County Medical Society go on record as approving the plans of the Public Health Service for enlarging the Marine Hospital at Stapleton.

James Alexander Miller, M D, spoke on the "Treatment of Pulmonary Tuberculosis by Artificial Pneumothorax and Surgical Collapse." Dr Miller laid marked emphasis on the fact that one must not forget the patient is being treated primarily for tuberculosis, therefore the treatment is rest, adding to that the immobilization of the lung. Pneumothorax is used in selective cases, particularly extensive active unilateral tuberculosis, but it may also be used for the control of hæmorrhage, acute unilateral pneumonic phthisis (where it gives the only hope), and unilateral cases which do not respond to bed rest. It may also be used early for short periods to

get rid of constitutional symptoms. An active lesion below the level of the second rib contraindicates pneumothorax of the opposite side.

Among the accidents attending pneumothorax mentioned by Dr Miller are puncture of the lung, collections of fluids going to tuberculous empyema, which, except in a few cases, does no harm, secondary infection of the fluid, which is serious, sudden death in a few cases, probably due to shock.

Adhesions in chronic cases of tuberculosis constitute a great difficulty as it prevents the full collapse of the lung. In these cases the adhesions may be cut by cautery under a cystoscopic-like instrument or the paralysis of half of the diaphragm may be brought about by cutting the phrenic nerve, or a more radical operation may be done.

Dr Miller showed a series of lantern slides illustrating some of his cases and the methods of treatment. Discussion was opened by Dr Timpone. A vote of thanks was tendered to Dr Miller for his interesting and instructive paper.

Dr Kingsley and Dr Harwood gave case reports of patients treated by artificial pneumothorax. Dr Kremer, superintendent of Seaview Hospital, spoke of his experience with pneumothorax at that hospital. Dr Patton spoke on the use of heliotherapy at Seaview Hospital.

The meeting adjourned at 10 45 to the Staten Island Club.

---

## CHENANGO COUNTY MEDICAL SOCIETY

The 120th annual meeting of the Chenango County Medical Society was held at Guernsey Memorial Library, Norwich, on Tuesday, December 9, 1924.

The following officers were elected for 1925: President, James B Noyes, M D, New Berlin, vice-president, Thomas F Manley, M D, Norwich, secretary-treasurer, John H Stewart, Norwich.

President's address: William E Hartigan, M D, Norwich.

"Relation of Hospital to Community," Miss Frances Higgins, Superintendent, Norwich Memorial Hospital.

"Sepsis," Thomas Manley, M D, Norwich.

"Diphtheria Prevention," F O Rinehard, Oneonta.

## MEDICAL SOCIETY OF THE COUNTY OF SULLIVAN

The Medical Society of the County of Sullivan held its regular meeting at the Hall House, Liberty, on Wednesday evening, January 7th.

The newly elected President, Dr Charles Rayevsky, appointed the following committees to serve during 1925: Scientific Program A J Peters, Chairman, J P Dworetzky and J C Gain, Public Health E Singer, Chairman, C Duggan and J W Davis, Law and Legislation L C Payne, Chairman, S W Wells and J B Amberson, Publicity J B Amberson, Chairman, H C Van Keuren, V C Bourke, J R Kuhn, and L C Payne.

At the suggestion of the President, the Society intends this year to interest itself in the dissemination of knowledge of health matters through the newspapers of the county, and especially to urge upon the public the advisability of periodic health examinations.

In line with this program, Dr Frederick W Sears of Syracuse was present and read a paper on the subject of "Periodic Medical Examinations—the method of making them and their importance as a health measure." By tables of vital statistics Dr Sears showed that, while the

average length of life is now greater than ever before, deaths from diseases of middle and later life is now increasing at a rather alarming rate. These include heart and kidney disease, cancer, hardening of the arteries and diabetes. Most of these start and advance without causing definite symptoms, and usually it is only in a routine examination once a year or oftener that the maladies can be discovered in their early stages. Early diagnosis enables the physician to advise the patient regarding the proper mode of life and consequently much suffering may be avoided and the life of the patient lengthened.

The subject was discussed also by Dr Joseph S Lawrence, Executive Officer of the Medical Society of the State of New York, and proper committees of the local society were instructed to study further the mode of procedure.

Dr J A Miller of Roscoe, read a paper on "The Operative Treatment of Carcinoma of the Breast" and presented patients who had been cured of cancer by surgical treatment.

The meeting was well attended by physicians from various sections of the county.

## THE MEDICAL SOCIETY OF THE COUNTY OF TIOGA

At the annual meeting of the Medical Society on December 2nd, the following officers were elected for 1925: President, Guy S Carpenter, M D, Waverly, Vice-President, Edward S Beck, M D, Owego, Secretary-Treasurer, W A Moulton, M D, Candor, Censors, L S Betowski, M D, of Waverly, L J Osborne, M D, of Nichols, F A Carpenter, M D, of Waverly.

The President appointed the following com-

mittees: Public Health—E E Bauer, M D, of Owego, L S Betowski, M D, of Waverly, Eugene D Holly, M D, of Candor, Legislation—M B Dean, M D, of Candor, R D Eastman, M D, Berkshire, L J Osborne, M D, of Nichols.

Dr Willard M Hilton, of Waverly, was elected to membership.

## DR GRANT C MADILL, GUEST OF HONOR.

Dr David E Hoag, president of the St Lawrence County Society, of New York City, announces that Dr Grant C Madill, of Ogdensburg, former president of the Medical Society of the State of New York, is to be the guest of honor at the twentieth annual banquet of the St Lawrence County Society, of New York, to be held Thursday evening, February 19, 1925, at the Hotel Astor, New York City.

The after dinner speakers will be Rev Dr S Parkes Cadman, Dr George D Stewart, and Hon George W Sisson. The society has nearly 1,000 members made up of former residents of

St Lawrence County. The membership lists contain the names of Irving Bacheller, Wallace Butrick, of the Rockefeller Foundation, Hon Frank B Kellogg, Ambassador to the Court of St James, Hon Owen D Young, chairman, Dawes Reparations Commission, Herbert F Gunnison, Stanley E Gunnison, Dr Wendell C Phillips, Dr Roger H Dennett, Dr Victor C Pedersen, Dr David R Rodger, and many others. Physicians may secure tickets at \$5.00 each by making application to Dr David E Hoag, president, 15 East 48th Street, New York City.

# THE DAILY PRESS

While half of our clippings during December were on the Christmas Seal campaign, only half a dozen were on that subject since the holidays. It would seem that the expenditure of the money would interest those who give it. People have a hazy idea about the fight against tuberculosis. Articles on the local work, scattered throughout the year, would arouse the interest of the donors to the anti-tuberculosis fund. Publicity is welcomed by both the newspapers and the public.

By far the leading subjects of the clippings this week are the outbreaks of typhoid fever and of the chicken plague in Greater New York. There are also a number of clippings about an outbreak of para-typhoid fever that apparently started in a bakery.

It is difficult to follow the course of the typhoid outbreak from the newspaper reports. The cause of the outbreak that is featured prominently is alleged to be raw oysters from New York harbor. This publicity regarding oysters has resulted in the almost total destruction of the oyster industry on Long Island. The warnings sent out by the Departments of Health of New York State and New York City were directed against *raw* oysters only, but the result has been that people do not buy oysters at all, and the oyster men have had to close their establishments. This has resulted in great financial loss. The *Sayville News* of January 2nd comments on the situation as follows:

"Some of our oystermen, whose business is being seriously hurt and their employees, scores of whom have been thrown out of employment in mid-winter, are asking some very pertinent questions. They are indignantly inquiring why it is necessary to employ a man to make this inspection. They want to know just what we pay a health officer for anyhow? Why are not the health authorities of the town of Islip, ready now or at any time to answer promptly and positively, any questions which may be put to them by the State or New York City health boards?"

"The shell fish industry of the Great South Bay is a great deal bigger than any one man and is of vastly more importance than any one man's job. In this Year of Our Lord 1925, the business of this great and rapidly growing township which has within its boundaries State institutions of vast importance, cannot be handled as it was in grandad's day.

"It needs a man who is able at any time to declare that the law which has been framed to absolutely protect the shellfish industry of our bay is being rigidly enforced. He must be able to prove to any State or City health officer by his records that frequent and careful inspections are being made."

The inference is that the shellfish from the Great South Bay, on which Sayville is situated, have been permitted to become polluted with sewage because of the inefficiency of the Board of Health.

Oysters from the Great South Bay, or Blue Points, as they are called, have not been condemned by the Health Departments. Some sewage has been allowed into the Great South Bay, but the Board of Health has discouraged action and publicity on the ground that the oyster industry might be injured. But now, since the oyster industry is almost ruined by publicity in the Metropolitan papers, and the oystermen are complaining, the Board of Health is acting vigorously on economic grounds. Still, the final result will be good, for all sewage will be removed from the waters, and the Blue Point oysters will be approved.

The oyster industry is probably the most sensitive of all industries to criticism. Milk supply may be condemned, but the people change dairymen. But when oysters are mentioned, the people simply stop eating oysters regardless of where they come from. The oyster dealers, therefore, have objected to a campaign of education at any time, and above all they have censored attempts to promote a control of sewage. A campaign of education carried on through the year would probably go far to remove the senseless fear of the people when typhoid fever and oysters are mentioned on the same page.

The chicken plague has come in for a vast amount of publicity in the daily papers during the past few weeks. The newspapers say that the cause of the disease is unknown, but one poultry dealer has ascribed it to feeding pepper to the fowl after they have been exhausted by a trip of several days in a poultry car. It is alleged that the pepper is given to increase the appetite and weight, and their engorgement with food is credited with producing a sort of food poisoning.

We have taken pains to learn just what the disease is. It is called "fowl plague," and is

caused by a filterable virus. It is exceedingly deadly and rapid in its course. Outbreaks have occurred on Long Island, and have been studied by the New York State Institute of Agriculture in Farmingdale. It is a rare disease, and has been reported only a few times in Europe, and not at all in this country previous to the present outbreak.

When fowl plague attacks a large flock, a few birds escape, and these are immune to virus injections that are invariably fatal to non-immune fowl. Studies are being made to develop a strain of immune birds, and also to discover a protective serum. In the meantime few chickens come to Greater New York, but the demand keeps up, and the people have no such fear of diseased fowl as they have of infected oysters.

---

The New York City papers reported about twenty families ill with so-called ptomaine poisoning as the result of eating cream puffs that were bought at a Brooklyn bakery. The reports state that a paratyphoid organism was found in the pastry, but no details were given in any of our clippings.

We recall a similar outbreak two years ago which was traced to an organism of the paratyphoid group that was peculiar to mice and rats. The same kind of organism, if not the identical one, was found in the droppings of mice in the bakery. We looked up the reports of similar outbreaks at that time, and found that very little definite work had been done on these organisms, but it is an accepted fact that several strains are toxic to human beings, and that human beings are in danger from the toxins of the organisms that have grown in food. There is great need that intensive research be made into the relation of mice and rats to food poisoning.

---

The Brooklyn *Times* of December 29th contains the following account of red worms that have appeared in the city water:

"Brooklynites today are watching their faucets for the bloodworm, a new species of animal life that has made its appearance in the Catskill water supply.

"Tie a piece of cloth over your faucet to trap the visitor, for the red worm can slide through the ordinary filter.

"There is no cause for worry, according to Dr. Frank Hale, chief chemist of the Department of Water Supply, except that you may experience the disagreeable sensation of swallowing a worm.

"The bloodworms are absolutely harmless, and, if swallowed, are readily digested, Dr. Hale asserts.

"When alive the worms squirm perceptibly and are easily visible in a glass of water. The worm is called the chironomus, and is the larva of a small fly of the ditтера family.

"The worm was first noticed in Manhattan, then it passed through Brooklyn, and today several complaints come in from Queens. This, Dr. Hale says, indicates the worm is passing right through the water system and will soon be eliminated. A similar appearance of worms was found in the water system a year ago, appearing more numerous in Staten Island than elsewhere.

"It may be a little unpleasant to see a red worm squirming in your glass of water, but no one would drink water in which animal life is noticed. If the worm is swallowed, however, it will not hurt you."

---

A new form of publicity is reported in the New York *Sun* of December 24th:

"Under the auspices of the East Harlem Health Shop of the New York Tuberculosis Association a Christmas carol party consisting of twenty boys from the Public School 39 Glee Club and five boys from that school's orchestra are traveling through Harlem on a bus this afternoon calling attention to the need of a 'Healthy New Year' and singing and playing holiday carols at various points. The bus is decorated with American flags and a large placard around the top rail with the message, 'A Merry Christmas and a Healthy New Year'.

"Free health examination coupons were distributed by Boy Scouts throughout Harlem, inviting the community to avail itself of the offer of a free medical examination at the East Harlem Health Shop."

# BOOK REVIEWS

**MANAGEMENT OF DIABETES, TREATMENT BY DIETARY REGULATIONS AND THE USE OF INSULIN, MANUAL FOR PHYSICIANS AND NURSES BASED ON THE COURSE OF INSTRUCTION GIVEN AT THE PRESBYTERIAN HOSPITAL, NEW YORK** By GEORGE A HARROP JR., M.D., Associate in Medicine, College Physicians and Surgeons Introduction by Walter W Palmer, M.D., Bard Professor Medicine, College Physicians and Surgeons Paul B Hoeber, Inc, New York. 1924 \$2.00 net

This book is a very well-written and easily readable treatise on the treatment of diabetes containing information valuable to any physician treating such cases.

The chapter on food recipes is excellent, giving a great variety of foods that may be used and also the caloric value and chemical constitution of each.

It also contains tables of food values and a chapter on the blood and urine examinations of the diabetic patient.

It well repays reading and careful study.

C. E. HAMILTON

**EAT YOUR WAY TO HEALTH A SCIENTIFIC SYSTEM OF WEIGHT CONTROL** By ROBERT HUGH ROSE, A.B., M.D., Instructor, Post-Graduate Medical School, New York. Thoroughly revised and enlarged Funk & Wagnalls Co, New York, 1924

The motto of the author in his text is "Right eating, normal weight, normal blood pressure and the prolongation of youth," and while it is impossible always to attain this Utopian ideal there is a great deal of common sense in the methods advised for use in its quest. The style is so simple and non-technical that it must have been intended mainly for the lay reader, although the long list of diets and menus with caloric values and vitamin content cannot fail to be of service to the physician or trained nurse. Stress is laid on the vital importance of protein in the diet, a point which was not generally known, or at least not often heeded, by the gastro-enterologists a few years ago when it was quite the style to put patients with intestinal toxemia on almost a protein free diet. Insurance companies have for years been impressed by the evil influence of overweight in the production of disease and the shortening of life and any source of spreading knowledge of how to control weight without undermining strength should be welcomed.

WM. HENRY DONNELLY

**MODERN METHODS OF TREATMENT** By LOGAN CLENDENING M.D., Assistant Professor Medicine, Medical Department University of Kansas With Chapters on Special Subjects by H. C. ANDERSON M.D., J. B. COWHERD M.D., CARL O RICATER M.D., F. C. NEFF M.D., E. H. SKINNER M.D., and E. R. DEWESSE M.D. Illustrated C. V. Mosby Co. St. Louis 1924 Price, \$9.00

The author has given us a careful survey of the present use and indications for drugs and other therapeutic measures. The volume is divided into two parts, the first on general therapeutics with methods used in treatment the second on special therapeutics including the application of therapeutics to particular diseases. The book is well written and embodies the writer's experience in teaching and in the care of the sick.

Part I contains not only a description of the commoner drugs used, but a careful resume of the use of sera and vaccines of gland therapy with its indications and contra-indications. Food values and the principles of dietetics are carefully reviewed and we have presented a complete set of tables of food values. Hydrotherapy, medical gymnastics, massage, exercise, electro-

therapeutics, radiotherapy and psychotherapy are discussed in the first part. The chapter on miscellaneous procedures describes many useful measures used in the care of patients which are not clearly understood during our early years and is a valuable chapter.

In Part II the author gives his methods of treatment of diseased conditions in the different systems or the body. The subject matter is presented in a concise, clear, rational manner and will be useful to one who studies this author's methods.

The volume is one which is much needed to make clear in the minds of many, some of the modern procedures and theories. It is instructive. The book is printed on excellent paper, in large type and the illustrations are excellent.

H. M. MOSES

**DIABETES, ITS TREATMENT BY INSULIN AND DIET** A Handbook for the Patient By ORLANDO H. PETTY, B.S., A.M., M.D., F.A.C.P., Professor Diseases Metabolism, Graduate School Medicine, University Pennsylvania, Physician in Charge of Department of Metabolism, Philadelphia General Hospital. Illustrations F. A. Davis Co, Phila., 1924 Price, \$1.50 net.

This book of 111 pages is, as the author states, a handbook for the patient. It contains the simplest statements concerning the disease and its cause. Instructions are carefully given concerning the abuse of foods, and the proper foods to be eaten, upon the examination by the patient of the urine and upon the technique of hyperdermic administration of insulin. Excellent tables upon food values are given and many diabetic meals are outlined. While instructive, this book is almost too much of a short cut to proper treatment to be of great value. It has been presented most attractively by large print with good illustrations upon the best quality of paper.

HENRY M. MOSES

**CALORIMETRY IN MEDICINE** By WILLIAM S. MCCANN, M.D. Octavo of 98 pages Baltimore, Williams & Wilkins Co, 1924 Cloth, \$2.25

Basing his views upon a comprehensive review of the recent literature, the author has attempted to evaluate the importance of the contributions of calorimetry to medicine and of the clinical use of the basal metabolism determination. He points out the broader fields of usefulness of calorimetry in medicine, in the belief that such studies have added to a better understanding of the mechanism of symptoms and of the action of therapeutic agents. However the review of the extensive literature of the basal metabolism in health and disease indicates that, except for its sphere of usefulness in disease of the thyroid gland, the diagnostic value of the basal metabolism test, as clinically used, is slight.

HENRY M. FEINBLATT

**COLLECTED PAPERS OF THE MAYO CLINIC AND THE MAYO FOUNDATION** Vol. XV, 1923 Octavo of 1377 pages with 410 illustrations Phila. and London, W. B. Saunders Co, 1924 Cloth, \$13.00

As in all previous editions, there is hardly a topic on surgery and the related sciences that is not touched upon in this well-known, yearly publication. A radical change however has been introduced in the present volume owing to the unusually large number of papers published from the Clinic last year. The material has been selected so that only those articles which are of practical interest to the general physician or general surgeon are published in full, while those contributions which are of a purely technical nature or relate to research work only are abbreviated, abstracted, or referred to by title.

## THE OCULAR SIGNS OF SOME BRAIN TUMORS ~

By ARTHUR J BEDELL, M.D., F.A.C.S.,

ALBANY N Y

**T**UMORS of the brain have been recognized for many years. The more exact routine ophthalmoscopic study has opened many a dark symptom complex to the bright light of neurological examination, so that no case of suspected intracranial growth is thoroughly examined until the ophthalmoscope has been skillfully used, X-ray carefully applied and the profound knowledge of the neurologist brought into action. The subject has been so widely heralded that there is little excuse for some of our late diagnoses. In the last twenty-five years, the literature has been teeming with case histories. Many extremely valuable monographs dealing with several features of a general problem have also added much to our knowledge. In this clinical paper, it is impossible to even mention them by title. For the purpose of this it seems unwise to enter the correlation to the cause of optic nerve atrophy. The work in this country of Cushing, E. D. Cushing, Bordley, Frazier, Heuer, Parker and others is so recent and so familiar to you that it would be a waste of your time to listen to a summary.

The cases that are here reported have been proven by operation or autopsy and are, therefore, removed from the realm of conjecture.

### TEMPORAL LOBE GLIOMAS

By comparing the fields of vision you will note their similarity. The fundi even in the presence of very large tumor masses showed no gross deviation from normal.

Through the kindness of Dr. LaSalle Archambault I am able to give the following history of J. M., a man 23 years old.

"First seen December 10, 1920, for peculiar attacks lasting only a few seconds during which he gets up, becomes intensely pallid, walks around the room uneasily with an anxious expression and dilated pupils. Such attacks may come on several times a day or he may go several days without

any. I saw two such attacks and they were characteristic of 'le petit mal.' The objective findings at this time were absolutely negative throughout, including eyegrounds. He was given a combination of bromide and luminal and returned for examination January 5, 1921, but stated that no improvement had taken place and, although urged to faithfully continue under observation, decided January 18th to stop the medication."

My examination September 17, 1923, showed vision of the right eye 20/20 and Type 1 with moderate degree of hyperopic astigmatism. Pupil 4 mm regular, active, media clear. Fundus negative except venous engorgement. The right eyeball was 15 mm more prominent than the left. The left eye 20/20 Type 1. Pupil reactions and fundus appearance similar to the right. Because

enlargement of the sella turcica with erosion of the posterior clinoids. The patient was told that "there was something inside of his head that should be investigated," and was advised, therefore, to enter the hospital for observation. His physician would not consent to such a detailed examination.

FIG 8

FIG 9

FIG 10

Dr Archambault saw the patient February 22, 1924, and found that the right frontal headache was less severe than formerly but that he was having attacks of somnolence, was increasing in weight and had a voracious appetite. The right pupil did not react to light but did respond to consensual stimulation. He had a marked grayish-white atrophy of the right disc, the left was normal. The other cranial nerves were negative and the extremities aside from the generally hyperactive tendon jerks exhibited no functional disturbance. The diagnosis was hypophyseal tumor or Rathke pouch cyst. The similarity be-

tween this and the next proven case is so striking that I think there can be no question as to the diagnosis.

A V F, a 13 year old girl, was first seen on November 11, 1922. Two years before she had complained of pain in her right ear and right side of her neck, which was said to be a symptom of nervousness. Four weeks before her visit she had been successfully vaccinated and four days after the "take," it was noticed that her writing was not on a straight line. This was followed by severe headache which became so intense that she was taken from school and an eye physician seen. Her vision steadily failed. She frequently complained of feeling as though she were going to be sick to her stomach. These attacks were followed by trembling and were ascribed to nervousness, particularly as they lasted only a short time, and as it was especially noted that they increased in severity as soon as she returned to school.

Vision of the right eye fingers at one foot. Pupil 5 mm regular, active, media clear, disc distinctly outlined, definitely pale without loss of substance. The left eye was divergent without fixation and fingers were seen at one foot. Pupil 5 mm regular, active, media clear, disc distinctly outlined, definitely pale without loss of substance. She had no spells of unconsciousness, no polyuria, polydipsia or appreciable change in weight.

Dr Archambault examined her on the 14th of November and reported that all of his findings except ocular were negative. She had no motor, sensory or co-ordination deficit in the extremities. The provisional diagnosis was tumor of the retrochiasmatal region either hypophyseal or floor of third ventricle.

Her field of vision showed contraction for form, in the right, with a large ring scotoma. In the left an isolated area for form in the lower nasal side. X-ray examination disclosed an immense cauliflower-like tumor in the hypophyseal

FIG 11

region. The parents were advised to take her to Dr Cushing. The following is a summary of his report.

"The child has an unusually distinct and extensive suprasellar shadow caused by calcareous depositions in a Rathke's pouch cyst. Operation

performed December 11, 1922, consisted of the osteoplastic procedure, evacuation of the cyst, and extirpation of large portions of calcareous pharyngeal duct tumor. Immediately beneath the dura there was a large cyst containing a slightly milky fluid with an abundance of cholesterol crystals, 70 cc of this fluid was collected. A soft tumor mass with gritty material lay between the right and left optic nerves in the region of the sella. A large mass of tumor and cyst wall was removed from the region of the carotid and middle cerebral arteries. After an extensive dissection the cavity was filled with salt solution, the flap replaced and the wound closed in layers without a drain.

"Following operation she was very well with great improvement in vision. Three or four days later, however, she developed a left-sided hemiplegia and died February 26, 1923."

The analysis of these two cases supports the view held by many that the seeming atrophy of optic nerve resulting from pressure is frequently a pallor and not a destruction of nerve fibers. This point has been discussed by several and is of considerable prognostic importance. It is certain that cases of this type tumor often show very marked improvement following operation, which could not result if the nerve fibers had been destroyed.

#### ACOUSTIC TUMORS

Acoustic tumors have, according to Cushing, probably been accurately diagnosed since 1777. Most of you have read the enlightening work by Cushing on "Tumors of the Nervus Acusticus" and in this short communication it would be unwise to even attempt the review of the development of this particular phase of brain diagnosis and operative relief. The subject can best be summarized in the words of Dr. Cushing: "That the acoustic tumors, owing to the characteristic chronology of their symptoms may as a rule be sharply distinguished from all other tumors of the cerebellopontile angle." The case here detailed is typical.

Mrs. L. J., 44 years of age, seen on January 14, 1924, said she had been well until October 1922, with the exception of an attack of influenza in 1918. During the winter of 1922 she had severe left frontal headaches which were worse in the afternoon. With this pain she had noises in her ears. These discomforts, however, lasted for only two months. She seemed perfectly well until October, 1923, when she had difficulty in seeing at a distance especially with the right eye. She also noticed that she could not hear well with her right ear and that the noises had returned on that side of her head. These symptoms were accompanied with intense epigastric pain referred to the back, extending into the occiput and along the spine, usually with nausea. The pain steadily increased in severity and at times she was given

morphin. In November, 1923, she had an attack of weakness of her right arm and right leg with the drawing up of the right side of her mouth and twitching of the right facial muscles. Her vision had steadily decreased.

I saw her in consultation in the Albany Hospital with her attending physician, Dr. Arthur H. Stein, and Dr. LaSalle Archambault. At that time, the right eye was blind, no light perception, pupil 4.5 mm reacting consensually, media clear, the papilla extremely swollen 7 diopters with rounded margin, few blood vessels, no hemorrhage or exudate, a classical choked disc. Tension Schiötz instrument 15.

FIG 12

The left eye, pupil 4 mm regular, active, media clear, disc swollen 7.5 diopters, with several flecks of exudate and faint striae of blood extravasation. Schiötz tension 13. Field showed an inferior nasal contraction.

It is particularly noteworthy that she was absolutely deaf in her right ear, whereas her left ear showed no change in function. Both drum membranes were retracted, thin, without scar or vascularization. Because of the intense involvement of both papillas, the blind right eye and the loss of hearing in the right ear, a diagnosis of acoustic tumor was made. Through a T-shaped occipital

FIG. 13

## THE PEDIATRICIAN AND PREVENTIVE PEDIATRICS \*

By HENRY L K SHAW, M.D

ALBANY, N Y

SIR JAMES MacKENZIE in his illuminating book on *The Future of Medicine*, pictures disease as consisting of four stages. First, the predisposing stage, where the individual is free from disease, but is liable to be attacked either from some inherent weakness or from an outside source.

Second, the early stage, when the disease has entered the human system but has not produced any objective signs, and the symptoms are chiefly subjective. The third and fourth stages are respectively the advanced stage and the final stage.

Preventive medicine is concerned with the first two stages. Curative medicine with the third and fourth. MacKenzie argues that physicians in their zeal to relieve suffering have overlooked and neglected the first two stages. Medical science has revealed much knowledge on many factors involved in the third and fourth stages. Now we have reached a point when attention must be focused on the problem of understanding the factors involved in the first and second stages. The problems, therefore, of preventive medicine.

The objects of preventive medicine as outlined by Sir George Newman are

- 1 To develop and fortify the physique of the individual and thus to increase the capacity and powers of resistance of the individual and the community

- 2 To prevent or remove the causes and conditions of disease or of its propagation

- 3 To postpone the event of death and thus prolong the span of life

He feels that the correlation of preventive and curative medicine should be realized in the well-equipped and trained physician of today, and that the physician should concern himself with measures for the maintenance of health as well as the cure of disease.

There is no reason why preventive and curative medicine cannot be brought together and practiced in perfect harmony.

One of the direct results of the recent advances in medical science is that preventive medicine now plays a very important part in the daily practice of the physician.

There is no branch of medicine in which the preventive side has been so fully developed and practiced as in pediatrics. Garrison in his *History of Pediatrics* in Abt's System says that pediatrics was elevated in the 20th

century from its ancillary status as a dependent dwarf of ordinary medical practice, into the larger atmosphere of social or preventive medicine, of which it is now one of the most important independent branches.

In this connection permit me to quote at some length from a paper read by Escherich of honored and revered memory, over twenty years ago. He spoke with the vision of a prophet.

"The greatest difference between the therapeutic problems of the pediatricist and those of the internist lies in the overwhelming importance and development of prophylaxis. The word prophylaxis in this sense is to some extent synonymous with care, inasmuch as in the education of the child on account of its lacking self determination, experience, and regulating methods, care must not only satisfy its bodily needs, but also guard it from all threatening dangers. To bring this about the experience of adults and the general rules of hygiene, however, do not suffice.

"It requires special individual instruction which can only be given by a pediatrician cognizant of the laws of child development and carried out by persons trained in them. Clinical experience and medical statistics show that nothing influences the mortality and liability to disease in children as much as a carefully conducted management by experts, and in this way, most if not all sicknesses may be kept away, at least in young children. Pediatricians have always known the great importance of protecting care and prevention even if only the magnificent acquisitions of the last few decades have shown them the proper way. The main point is the constant and careful watching over the course of the child life as a whole, but especially during the first period of growth, the care and furthering of normal development, the taking care of those backward in development, improvement of the already developed functions, special attention of the rapidly growing organs, prevention of the tendencies to acquired or inherited diseases, protection from injurious agencies, especially infections.

"Disease with which the medical care generally begins is here to a certain extent a failure of preventive care, an interruption disturbing the normal process of development. But why," he asks, "should we hesitate to place individual prophylaxis, based on raising the power of resistance and avoidance of disease, as the ideal aim of our efforts?"

\* Read at the Annual Meeting of the Medical Society of the State of New York at Rochester April 23 1924

Dr Holt in his presidential address before the American Pediatric Society last May discussed the pediatrician of the future, and described three distinct types that would be needed

"First, a research man who is likely to be a full-time head of a department in a university medical school

"Second, the man who applies our best science in the treatment of sick children in the home or in the hospital or dispensary, and third, the public health pediatrician who organizes and directs this special department in the state, city or county" He considers them all equally essential, but that at this present time the public health or preventive pediatrician is in most demand

This same thought was brought out by Veeder in his address on the "Trend of Pediatrics" last October before the American Child Health Association and the Central States Pediatric Society He claims, and rightly, that the problem of the future is how best to correlate these three types, all of which are so important to the health of the child, so that we can go ahead with a unity of purpose which is necessary in order to obtain the best results The tendencies of each type of pediatric activities have in the past been to diverge from each other, but it is hoped that in the near future they will converge or at least run in parallel lines

The clinician has looked with distrust and sometimes with *ridicule on the child hygienist* He feels that curative medicine and remedial measures are of the utmost importance, and pays but scant attention to the claims of preventive medicine The child hygienist on his part feels that prevention is of greater importance than the treatment of disease Both are concerned with the health of the child and their aims are identical It is the old story of the shield The clinicians see only the silver side, while the child hygienists see the gold side

It is no doubt unnecessary for me to make a plea to the members of this Section to combine the remedial and preventive branches of pediatrics The successful pediatrician is a counselor of health as well as a purveyor of pills An increasing number of mothers consult him on matters of diet, management and general hygiene of her child Such advice can only be given intelligently after a careful examination of the well child, and some knowledge of the conditions surrounding the child at home It requires skill, patience and special experience to make a thorough examination of a well child, and be able to detect signs of potential disease in the first stages, and to

give simple and scientific advice concerning health habits and diet which will correct any abnormal tendencies or incipient physical and psychical defects

Medical colleges in the past neglected the teaching of preventive measures and the study of the well child Medical students were quizzed and drilled on pathologic conditions and were taught almost exclusively in hospitals and dispensaries Today there is beginning to dawn a new era in the teaching of pediatrics The student is given practical work in child hygiene at the Welfare Stations, Schools and Health Centers He is taught the physical and mental development of the child as well as its care and nutrition Decided progress has now been made along these lines, both in the medical colleges and post graduate courses that the physicians as well as pediatricians of the near future will be trained as practitioners of preventive medicine

As a result of the indifference of the average pediatrician to child welfare work his domain has been encroached upon by outsiders, not trained in medicine, but keenly alive to the necessity and opportunity for this line of work. The social worker, the nutrition expert and the public health nurse have entered in and in some instances monopolized the field One result has been to show the public that the physician is not the only one to whom they may turn for advice in health matters On account of lack of training and lack of interest a pediatrician skilled in curative and diagnostic measures, may show up at a great disadvantage when asked questions regarding health habits, mental development, etc., by parents who have read the popular literature on these subjects and want more specific and detailed information

There is a feeling of distrust and perhaps jealousy on the part of some pediatricians toward the child welfare clinics They learn that one of their little patients has been taken to a child welfare conference That the visiting nurse has followed the case in the home and that the mother has become a regular attendant The family physician feels and justly so, that he has lost a patient It is true that if the child becomes ill he will be referred back to him, but the advice given and the better care received will prevent illness, and therefore the need of his services

We are only on the threshold of preventive medicine and in the enthusiasm of those interested in child hygiene great efforts are made to popularize maternity, infancy and child hygiene clinics and little or no restriction is made of the social and financial condition of the patients The children of the poor should and must receive the best possible care and

attention and no restriction or curtailment of this service is desired. The work with this class of patients should be extended and improved. The same legal requirements, however, should apply to child hygiene clinics as to dispensaries. The parents should be obliged to sign a card giving the amount of their income and stating they cannot afford to pay for the services of a physician. A clever satire on this situation was written by Dr. Bryant, Secretary of the Maine State Medical Association which he calls *The Free Road to Health*.

"The prenatal clinic cares for the child in its mother's womb and guides it into a hostile world. It is received into the motherly lap of the baby welfare clinic and tenderly cared for. It receives its nourishment from a warm and hygienic bottle, prepared in the baby milk laboratory. Its tottering steps are guided by the helping hand of the child welfare society. In due time the child enters school, where he is welcomed on the threshold by the school nurse and introduced to the school physician. He is vaccinated against smallpox, inoculated against typhoid, is given the Schick test and made immune to diphtheria. His teeth are looked over at the dental clinics, and his tonsils and adenoids are removed at some hospital out-patient department. His eyes are examined and possibly fitted to glasses. Thus equipped and prepared he at once starts to do his health chores. Found underweight he enjoys for a time the luxury of an open air school under the supervision of the nurse and physician of the Anti-Tuberculosis Association. Thus he is guided through school and may take a chance at college. If he escapes here for a moment from his guardians and falls to evil ways there are free clinics provided for even these emergencies.

"Safely passing his health inspection and eugenic society examination, wedlock is entered. In due time his wife becomes an attendant of the maternal welfare clinic. His health is guarded by his periodic health examinations. He is looked after at his work by the industrial nurse and then is prescribed for by the industrial physician. It sick at home he has the care of the visiting nurse and the social worker. His future is provided for by his industrial insurance and old age pension. In his declining years he enters some rest home for the aged. His dying pillow is smoothed by the institution nurse and his room brightened by the home visitor. Some burial society looks after his funeral. At last he lies at rest after a long and pleasant journey along the free health road. A high ideal to strive for, and a pleasant journey—we wish him well."

It behooves the medical profession to offset

and hold back a rising tide of popular demand and sentiment for free examinations and advice. Dr. Eugene Kelley, State Commissioner of Health of Massachusetts, says that we must take the letter R out of free and place hygienic work on a fee basis.

No pediatrician can support himself and his family without receiving adequate compensation for the examination of a healthy child and for advice regarding his diet, habits, exercise, play, sleep, and matters concerning the preservation and betterment of health and prevention of disease.

Unfortunately our medical brethren are in a large measure responsible for the situation. They give advice along health lines and regarding health measures gratuitously in their offices and on the street corners. The public must be educated to an understanding that the service and advice rendered by the physician in regard to health betterment and prevention of disease is just as important and just as valuable as that rendered in restoring the sick to health, and should be paid accordingly. It is an inherent human trait to get something for nothing and this is not confined to any one creed or race.

As an illustration of the attitude of the medical profession let me quote from a letter sent recently to each of the parents of over 200 boys attending a well-known private day school:

"No expense will be incurred in having this work (the Schick test and T.A.T. injections) done, as two physicians, Drs. Blank and Blank have generously offered their services. Both these gentlemen have had much experience in performing this test and in reading the arm, and in giving the toxin-antitoxin injections. The material will be furnished by the State Department of Health."

The object of this letter was most desirable and commendable as the Head Master and Trustees desired to have all the boys immunized against diphtheria. The part played by the physicians is open to criticism, as the parents of these boys are abundantly able to pay for such service.

Dr. Howe, Director of Medical Inspection of Public Schools in the State Department of Education, told me the other day that it was not the policy of the Department of Education to have medical and preventive work performed in the schools. They strongly oppose it and advise against it. The function of the schools is education in health and health matters, and all vaccinations, immunizations, corrective work, etc., should be done outside the school by the family physician, or at a dispensary.

Preventive pediatrics is advancing by leaps and bounds. Popular health propaganda and education is showing results by the increasing demands of parents to have complete periodic physical and mental examinations made of their children, and they should be made to pay well for such services. The difficulty today is that many pediatricians are not fitted or interested in making such examinations. A thorough physical examination should include at least hearing and visual tests, relation of weight to height and age, examination of teeth, nose, ears, throat, heart, lungs, spine, posture, feet, nervous system, mental and emotional state and general tone. Analysis of the urine and blood should be made. It should also include inquiry and advice as to diet, clothing, exercise, sleep, habits and training. These examinations should be made at least twice a year and careful records and charts made. The physician's office should be more of a service station than repair shop.

These examinations should be made by the family pediatrician, who should also be the family health counselor. He knows better than a clinic pediatrician the intimate relation between the physical condition and the home environment. He is acquainted with the parents and their shortcomings. He is familiar with the child in sickness as well as in

health. He is the one to vaccinate and immunize the child against smallpox, typhoid and diphtheria. For this and much other health service he should receive financial compensation much greater than in the ordinary treatment of diseases as it occasionally develops.

The dental profession has shown with what ease and success the public can be educated to have an examination made of the teeth once or twice a year. Dentists will tell you as they have me that their work has been increased and has been made more pleasant on account of this dental prophylaxis.

Dr. Forbush, an eminent doctor of divinity, in an article published in a recent number of the *Journal of the American Medical Association* on "How the Doctor Looks to the Layman," says that the doctor's "greatest duty today is to educate us. With a popularization of medicine we shall learn to call the doctor more often when we are well, so that we shall less often be sick. We shall engage him to teach us the regime of living and how to prolong life joyously instead of to eke it out. We shall then understand the peril of substituting the soda fountain clerk for the physician in dealing with human lives. And we shall learn the difference between St. Luke, the good physician, and St. Vitus, the back-bone manipulator."

## ATROPHIC RHINITIS\*

By CHESTER C. COTT, M.D.,

BUFFALO, N. Y.

**A**TROPHIC rhinitis is a disease characterized by abnormally broad nasal passages and the presence of purulent secretion and crusts. It is usually first noticed at puberty, seldom appearing later than twenty-five years of age.<sup>1</sup> When the disease has the additional symptom of fetid odor it is called *ozena*.

There is no single cause of atrophic rhinitis. Syphilis as a cause has never been proven, neither has tuberculosis, although both classes of cases occasionally develop the disease. Opinion seems settled upon the fact that the basic cause is an interference with the blood supply of the nose. This may be due to a chronic inflammation or suppuration or chronic venous congestion.

That there is an actual trophic disturbance is evident upon gross and microscopic examination of the diseased area. The nasal chambers are broadened by an actual absorption of the mucous membrane and turbinates. They

often appear one-third the normal size. The membrane is no longer erectile in type, but hugs the bone closely. The microscope reveals a rarefaction of the nasal bones and sclerosis of the blood vessels (2).

The bacterial infection is usually mixed, with staphylococcus predominating. Many attempts have been made to isolate the causative bacteria and some claims have been made that certain ones have caused the disease. In tuberculosis cases, who have atrophic rhinitis, the TB bacillus is frequently present, although Linthicum after exhaustive examinations concludes that the acid fast bacillus found in these cases is not identical with the tuberculosis bacillus (3). Perez *ozena bacillus* is stated to be an etiological factor in at least fifty per cent of cases by Hofer and Sternberg (4). The fact remains that there is no specific bacterial cause present in every case.

Chronic suppurative sinusitis appears to me to be the cause in most cases which have come under my notice. When we realize that

\*Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, April 23, 1924.

infants and young children have this disease (5) and that many go without care for years, it can easily be understood what damage this purulent discharge can do to the nasal mucosa and then the underlying bone. Many such cases are cured of their sinusitis by the removal of tonsils and adenoids, some heal spontaneously, but that many are affected in this manner was proven by White, who examined fifty children as they presented themselves for tonsillectomy at the clinic and found evidences of pathological sinuses in forty-one of the fifty (6).

The symptoms of atrophic rhinitis are quite characteristic. Persistent dull headache, nasal discharge, profuse and heavy, occasional removal of scabs, post-nasal catarrh, and fetid odor are the usual complaints. Upon examination the nasal fossae are broad, due to the absorption of the ethmoid and inferior turbinated bones which has occurred. Pus lies in the hollows of the bones and scabs adhere to the membranes, occasionally forming a cast of the passage. Upon removal slight bleeding may occur. When the pus has been cleansed away, more may be seen coming from the visible sinus openings. Upon suction, more pus may be obtained, although occasionally cases may have no sinus involvement, at least none seem to be involved. It seems probable that such cases had suppurative sinusitis, but due to the better drainage secured by the bone absorption, the individual sinuses healed, leaving only the external evidences of the disease. I have found that the antrum is rarely involved, the sphenoid occasionally and the ethmoid most frequently. Examination should be complete until one has definitely learned which if any sinus is affected, for these will need drainage before a cure will be obtained.

Since atrophic rhinitis is such a persistent disease and has been well recognized for many years, many types of treatment have been employed. These may be classed as surgical, non-surgical and treatment with vaccine.

The nasal chambers are too broad in this disease. Therefore attempts at cleaning the nose are unsuccessful, because the air expelled does not pass through with enough force. Narrowing of the passages has been attempted by various means, the simplest of which has been the injection of paraffin. This has been placed under the perichondrium of the septum or periosteum of the turbinate. In recent years, many of these cases developed paraffinoma of the face, a fatal disease which occurs several years after injection, so that this method is now seldom used. Botey advised the use of white vaseline 10 gm and sulphate of baryta 20 gm in place of the paraffin (7). The lateral nasal wall has been severed from its attach-

ments and moved bodily toward the septum. Several men have described methods for this purpose. Hinsberg (8) after moving the maxillary walls toward the septum, holds them in place with metal plates, which should be removed in several months. With somewhat different technique Max Halle (9) accomplishes the same result, retaining the wall in position by packing within the antrum. These operations so narrow the nasal passages that the purulent secretion may be expelled by the patient, thus eliminating the odor, which they say is checked immediately. However, G. Liebault (10) calls attention to the fact that such procedures do not take into account the trophic disturbance present in this disease, and that they correct only the lower part of the nose, leaving untouched the posterior group of cells, which must not be neglected if a permanent cure is to be obtained.

Under surgical treatment must be mentioned the drainage of all suppurating sinuses. The antrum may be attacked as radically as desired or as necessary and also the sphenoid, as the openings made into these two sinuses in time become very much smaller and the nasal chambers are not increased in width by radical operations upon them. The ethmoid, however, should be treated gently. No more bone than absolutely necessary to obtain drainage should be removed. The middle turbinate, which is very much reduced in size, should never be removed. All necessary operative work can be done external to this bone. A case of atrophic rhinitis with frontal sinus suppuration has not come to my attention.

Non-surgical treatment consists in careful and frequent nasal cleansing. This should be done as often as necessary to keep the secretion from drying upon the membrane and causing an odor. For office treatment the suction apparatus run by an electric motor is efficient. The suction tube is led to a bottle from which another tube goes to the patient's nostril. A second tube leads from the other nostril to an irrigating can containing an alkaline solution. With the patient's head well forward and the alkaline solution a little lower than his head, the motor is turned on and the solution sucked into one and out of the other side of his nose carrying with it most of the secretion. Glass tips are used for insertion into the nose. Patients need a little practice to do the irrigating correctly, but I have an eight-year-old girl who does very well. Some will have to swallow or say "k" to start the suction. Scabs may be blown out or easily picked out with forceps after such treatment. Iodine 5% in glycerine or ichthyol 10% in glycerine and water should be applied when the nose is clean. Of course,

the postnasal space and pharynx should be inspected and treated the same if required

Home treatment is absolutely necessary. I have never seen an atomizer or nasal douche type of treatment do any good whatever. They do not get out the crusts or thick pus. After the patients have seen the office suction apparatus at work, they should be instructed to make a similar one at home. This can be accomplished by two methods. A water tap suction pump may be used instead of the office motor or the suction may be obtained by the weight of the irrigating solution passing out of the nose through a long tube. In using the latter method a douche bag containing the irrigating solution is hung at the level of the head. The hose with nasal tip is put into one nostril and another tip with hose attached is held in the second nostril. With the patient in a standing position, the head is lowered slightly to start the flow. As it runs into and out of the nose, it fills the long tube and the weight of water in this hose is sufficient in most cases to obtain good results. Irrigation should be done twice daily at home. Some cases may be taught to apply medication to themselves, after washing.

Sugar has been used both by intravenous injection and locally to the nasal membranes. Wiethe (11) injected a 20% solution intravenously, 40 cc every other day during a week and then a few days rest when 50 to 60 cc were injected repeatedly. He claimed rapid relief of symptoms. Tarneaud (12) uses glucose in two strengths, the weaker to be used in an atomizer and the stronger to be poured into the nostril with a spoon. He believes the glucose allows the growth of common bacteria in the nasal fossae, thus interfering with the growth of the pus-producing organisms, and by their hypertonicity, producing greater serous nasal secretion which is desirable in these cases.

Vaccine treatment has been tried by many with various results, perhaps because of the variety of bacteria present. When a particular

one predominates, good results may be expected. For instance Linthicum (3) used tuberculin in a series of cases with excellent results, although he was quite satisfied that the bacillus obtained from the nose, although closely resembling the tubercle bacillus was in fact not the same. Clinically, the nasal disease in these cases responded to the treatment. In his series of 126 cases definite tuberculosis was found in 52.

You will gather from the foregoing varieties of treatment, that just as there is no single cause of atrophic rhinitis, so there is no sure cure. Still, it is not very difficult to keep our patients comfortable and inoffensive to their associates. The principles of treatment are definite: make the nasal fossae as narrow as possible, clean up all localized sinus infection, keep the nose as free of pus as possible by frequent, thorough cleansings.

#### ACUTE ETHMOIDITIS\*

By FRANK M. SULZMAN, M.D.,

TROY, N. Y.

IT seems to be a general rule in papers of this character to begin with a general description of the anatomic parts under consideration. For the sake of brevity you will allow me to omit a great part of this description which would become a tiresome repetition. Instead, I shall emphasize certain points which a review of the

literature shows to be of special value in the study of the anatomy of this very important part of the nose.

The great complexity of the adult ethmoid labyrinth and the variations in size, shape and disposition of the individual cells composing it are in accord with the early anatomy and development. For example, The table given by Loeb of the size of this ethmoid labyrinth will range in the

\* Read at the Annual Meeting of the Medical Society of the State of New York at Rochester, April 23, 1924.

anterior posterior diameter from 22 to 55 mils, the superior inferior from 17 to 59, and the lateral from 19 to 28, according to Pratt, the anterior cells will vary from 2 to 8 in number and the posterior from 1 to 7

With such a wide variation as these tables show it is easy to see why many difficulties are encountered when we attempt a description and why many more are met when surgical measures are being taken to eradicate diseased conditions in these cells

It is common to describe these cells as belonging to an anterior and a posterior group but if you will study the work of different men who have gone over hundreds of these skulls you will become impressed with the theory that a posterior cell may be anterior and an anterior cell may be posterior. It is impossible in very many instances to judge merely from its position whether a cell belongs to the anterior or posterior ethmoidal group. The location of the ostium in the body of the cell determines the cell's classification

The anterior group drains into the middle meatus and the posterior group into the superior meatus or along the posterior border of the middle turbinate. These cells may encroach upon the lumen of the frontal, sphenoidal and maxillary sinuses, changing their size and lumen. The cells will also encroach upon the orbital wall and when infected add grave danger to the sense of sight and to an infection within the orbit itself.

Those of you who have had the good fortune to hear Professor Schaeffer of Philadelphia and to see his wonderful collection of slides describing the embryology and development of these cells must have been impressed with the enormous amount of work he has done.

In connection with this work it would only be fair to mention the names of two distinguished members of this section, Doctors Phillips and Coakley of New York, Mosher of Boston, Skilern of Philadelphia and the studies of Sluder, men who have done much to enrich our knowledge of the physiology and anatomy of these parts.

With the aid of a few slides I shall later try to show you why we sometimes have failure even after the most careful operative work in the ethmoid labyrinth, why we should not be discouraged if, after several attempts, we fail to attain the result we desire, and why it is not by direct injury alone that we have a possible extension and cause of meningitis, which is one of the dangers to be feared and always respected in operating in this region.

In the acute type of infection of these cells, the subject of this paper, we have the classification of the catarrhal type and the suppurative

type. In the acute stages the mucous membrane presents the ordinary symptoms of acute inflammation. Any acute cold in the head is accompanied by infection of these cells which disappears because drainage is not interfered with and with the subsidence of the primary trouble no further work is necessary. But when the cells are not properly drained, accompanying any acute condition in the nose or general condition causing infection in these cells, we have symptoms which are quite characteristic and which need attention at our earliest possible moment.

Two fairly constant symptoms always accompany an infection of the ethmoid. First, a feeling of stuffiness in the nose itself, second, pain either in the nose frontal or occipital regions, made worse by change in posture or any attempt to clear the nose.

Pressure over the region of the ethmoid usually elicits pain and an examination will show the swollen condition of the mucosa of the entire nose as most of our sinus troubles are caused by repeated colds which cause the mucous membrane to become oedematous and hyper-plastic.

When the patient is lying down the blood pressure is higher in this locality with consequent swelling and temporary occlusion of the ostium. The sinus mucosa in the meantime is absorbing the oxygen which is contained in the sinuses but as no more can enter there results within a condition of negative pressure with swelling and transudation through the mucous membrane, after a time, however, the ostium again becomes patulous but the membrane does not have time to fully regenerate before the ostium again becomes occluded through the same causes. This irritation and swelling produce inflammatory tissue changes that make it a suitable culture medium for bacteria the first time the patient contracts a severe cold.

A discharge seen in the middle meatus would aid us in locating our trouble in either the anterior, ethmoidal or frontal sinus. A discharge along the posterior portion of the middle turbinate or in the superior meatus would be from the posterior cells but I should not entirely base my diagnosis on the presence or absence of discharge insofar as I could see it. You must take into consideration the other symptoms found on examination before excluding ethmoiditis. A large majority of the acute type of ethmoidal infections subside without much difficulty by treating the primary trouble. To a certain percentage, however, this does not apply and it is necessary to do more, opening and draining as conditions warrant.

The X-ray is of much greater value than transillumination in the diagnosis of these conditions.

Trans-illumination is not always very satisfactory

Certain symptoms, I should like to bring to your attention, of these the most prominent, headache

Headaches resulting from sinus infection are among the most frequent and at the same time the least understood of all the symptoms of the disease. Many cases of sinus disease with slight nasal symptoms go through their entire life with chronic headaches taking all manner of cures without it occurring to the doctor that headache might be caused by disease in the accessory sinuses. Headaches of this type are intensified by constipation, sudden jarring, stooping, use of the eyes, mental work and loss of sleep. In ethmoiditis the patient speaks of dull pain between the eyes usually accompanied by a sense of weight over the vertex. Dizziness and vertigo are also frequent symptoms.

Extension of the infection from the ethmoid condition to the tissues of the orbit causing orbital cellulitis is a second symptom. When the optic nerve is involved in these cases there follows loss of vision in varying degrees.

Third in the list of symptoms, a possible meningitis by extension through normal opening or by breaking down nature's barrier and causing it by either direct trauma or an extension of an infection.

This was clearly shown by two speakers at the meeting of the Academy of Ophthalmology and Oto-Laryngology held in Washington last fall. It is the neglect of many of these acute cases with subsequent reinfection that lead to the chronic type and with this condition present our problems are many and require the utmost patience to carry us through to a satisfactory result.

A treatment of the general cold together with the shrinking of the nasal mucous membrane and use of the suction pump with any of the ordinary nasal oils usually gives great comfort and may be all that is necessary. Some cases require operative work and we should not wait too long before giving relief if the ordinary measures already spoken of do not relieve. Have in mind that you are dealing with an infection.

A review of the literature regarding operative procedure shows the difference of opinion. Some will tell you not to touch the middle turbinate, keeping external to this. Others will advise opening and removing portions of or the entire middle turbinate. Here again we must remember our anatomical relations and the finding of those who have studied and examined many skulls. If

ethmoid cells are sometimes found in the middle turbinate and this view is substantiated by competent observers, they must be opened when infected—whether it is turbinate or not must be forgotten.

### CONCLUSION

Age does not exempt from this infection.

Expect to find wide variation in the size and position of the cells. Many of the conclusions as given by Davis I feel I should emphasize as they are in accord with most of our findings. "Ethmoiditis is far more frequent than has been generally recognized, the milder forms, particularly those of childhood, being the class most frequently overlooked and its importance greatly underestimated."

"The apparent greater frequency in adult years and the greater severity of effects are largely due to neglected acute attacks in childhood, which, with each recurrence leaves an added predisposing factor toward other attacks or toward the perpetuation of a process already begun."

"So-called bronchial asthma is principally a result of ethmoidal disease, particularly the type productive of polyp formation."

"More headaches and various neuralgic pains are due to processes developed from chronic ethmoiditis than from all other sources combined—the majority of which can be relieved by surgical treatment."

"A large percentage of ocular pains owe their origin to ethmoidal disease and must be relieved by treatment directed to the intranasal causal factor."

"Ethmoidal infections are frequent sources of both catarrhal and purulent aural disease, and in every aural infection careful treatment directed to the accessory sinuses is of equal importance to treatment of the ear itself."

"Radical operations on the sinuses should be employed only where conservative measures faithfully applied prove inadequate."

The advice of Skillern should always be before us: "Better to do too little than too much."

## COMPLETE ECTOPIA LENTIS—REPORT OF CASE \*

By E W KENNEDY, M.D.,

ROCHESTER N Y

**E**CTOPIA lentis is of infrequent occurrence and is a congenital malposition of the crystalline lens, as distinguished from luxatio lentis or traumatic dislocation. The condition is invariably bilateral, and usually displacement is symmetrical, and said never to be directly downward. The upward tendency of the displacement suggests some relationship to the closure of the secondary optic vesicle. There exists a marked tendency toward transmission and frequent association with other defects as coloboma of iris, lens, choroid, etc.

Most observers unite in the belief that ectopia lentis is due to defect in development of the suspensory ligament, occasioned by failure or late closure of the ocular cleft in the ciliary region. In considering the development of this suspensory ligament or Zonule of Zinn, we recall that the primitive lens remains in contact at its sides with the portion of the secondary ocular vesicle destined subsequently to become the ciliary body. The lens becomes encircled by what is termed its fibro-vascular sheath, which forms adhesions from contact with portion of secondary optic vesicle and as the eyeball enlarges, it does so at a greater rate than the lens, so that a portion of the ciliary body which was in contact with the lens grows away from it and adhesions which have formed between them become stretched, leaving only the delicate fibres of the suspensory ligament as seen in the adult eye.

The absence of the fibres in the Zonule of Zinn in the inferior region allows the lens to be drawn in an upward direction, rather than directly downward. Displacement might also be occasioned by the adhesions between the ciliary body and the margins of the lens being denser on one side and less elastic than normal, so that they expand less readily than those on opposite side, this would account for those cases in which fibres of the suspensory ligament can be seen stretching across the aphakic area. Traction of the hyaloid artery and bands in the vitreous have been offered as causes.

In reviewing the causes of developmental defects permitting ectopia lentis to ensue, one is interested in the work in biology and notes the work of Guyer, Stockard and others. It is during the second week of embryonic life that the primary optic vesicles become visibly differentiated and appear as offshoots of one of the primary brain vesicles, the fore-brain. While there are different beliefs as to

the manner in which it comes about, we find the theory of Stockard quite well substantiated by experimental work. He considers that the cells or elements entering into the formation of the eyes have their origin in the median portion of the developing nervous system. He was able to excise portion of the median plate and prevent the formation of eyes, and the early removal of a lateral portion did not prevent development of two eyes, while if done later indicated that the optic vesicles were situated laterally.

In subjecting young fish eggs to exposure to heat, cold, chemicals, fumes, etc., he was able to arrest the development of the optic vesicles at various stages and obtain defects of many degrees, ranging from cyclopia through defects of varying degrees to practically normal eyes. Probably the effect of the various agents is much the same—acting upon the embryonic structure to inhibit its development. The type of anomaly depends upon the period of development at which the inhibiting agent is applied and the development arrested or retarded.

Guyer has injected pulverized rabbits' lenses into fowls and then injected this fowl serum sensitized to the crystalline lens into rabbits pregnant about ten days.

In the offspring he has observed abnormalities, such as lenticular opacities, coloboma of iris, choroid, displacement of lenses, variation in size and position of globe, etc. By mating these rabbits he has observed the defects appearing in the progeny, and noted that the defects tend to increase and appear in proportionally greater numbers in successive generations. He has been able to carry a defect through as many as nine generations, and feels that it can be transmitted indefinitely, once secured.

Wm N, age 47, laborer, presented October 5, 1919, stating that his eyes had always been poor, but that for about six months he had noted periods in which the vision of left eye had been greatly disturbed. He states that his father's eyes were "affected from birth," and his grandfather had "poor eyes all his life," finally blind when he died in old age. On mother's side were many children—none known to have any eye defects. Patient had one brother, age 50 at death, whose eyes were good, one brother, died at age of 8, had "poor eyes," and a sister died in infancy. Patient has four boys and one girl. In the eldest, age 14, crystalline lenses are displaced outward,

\* Read at the Annual Meeting of the Medical Society of the State of New York at Rochester April 22 1924

the next three appear normal as to structures and vision. In the youngest, the girl of 5, the lenses are displaced outward.

Patient shows external structures normal, the corneas being 11 mm in diameter, deep anterior chambers, irides tremulous, pupils equal and active to light. No colobomata. Vitreous clear, fundus details very small and best seen with +10 D. In the center of each disc is a small greyish tag extending into vitreous for about 5 D, probably remains of hyaloid sheath. In the bottom of each vitreous chamber is a grayish lenticular-shaped body, with faint lines of segmentation converging toward center. No coloboma seen. Tension O D

15 mm, O S 52 mm (Schiotz). Vision (with glasses) O D = 20/50, O S = L P. Upon movements of eyeballs, we have been unable to detect any motion of the lenses lying upon the floor of the vitreous chambers. Through several years and by several observers, the lenses appear to be firmly situated in their positions.

Many cases of lenses floating about in the vitreous chamber are reported, invariably thought to be associated with trauma, but so far as I have reviewed the literature of 20 years I have not found a recorded case of completely displaced lenses in this position, which could be considered of congenital origin.

## DO ELDERLY PEOPLE HAVE INFANTILE PARALYSIS?\*

By A L HALL, M D,

FULTON, N Y

**A** PROPOS to this question, a brief history of a case occurring recently in a male patient eighty years of age is offered for your consideration.

On July 17th, 1924, P Q, of Fulton, N Y, an active workman of good habits and previous good health, was taken with severe headache and some nausea accompanied with chilliness, fever, sore throat, stiffness of the neck and upper dorsal region, difficulty in swallowing and systemic weakness, being unable to stand. Was ailing for about three days before taking to bed.

The following day, I was called to attend him and noted the following symptoms in addition to those given:

Temperature 103.5°, pulse 116, respiration 30. Was very nervous and apprehensive, eyes glassy and staring, unable to swallow food or liquids, extreme rigidity of the neck and upper dorsal spine with marked tenderness over these regions, sore throat, the mucous membrane being moderately congested and slightly swollen and indicative of a relaxed state of the throat structures rather than of acute inflammatory action, numerous small swollen glands of the cervical region, muscular tremor of face and upper extremities, erect in bed owing to a sense of suffocation and fear he would choke to death, patellar reflexes diminished, throat reflexes not easily excited, obstinately constipated for several days. For the next three days, these symptoms persisted and he could not be induced to take any food or

swallow liquids. The temperature slowly dropped and on the fifth day became normal, although the pulse and respiration rates were higher than usual.

Recovery was slow, being confined to the bed for three weeks. He has gradually improved in general strength, the tonicity of the lower extremities is increased, the patellar reflexes being now normal, but some leg weakness is evident. Throat reflexes are nearly normal and he can swallow solid food easily, but liquids are still swallowed with some difficulty. He has never presented any evidences of any organic paralysis—recent or remote, nor is there any history of previous motor impairment and, apparently, his difficulty in swallowing and other related symptoms were due to an acute systemic infection which I was unable to satisfactorily diagnose. However, several times, while in attendance, I remarked to the patient and members of his family that if he were not so old, I would unhesitatingly say that he had infantile paralysis. Within the past month, I have, several times, had my attention called to other cases having many symptoms similar to those of the case recited, occurring in elderly people, but lacking the severity of this one.

In the locality where I reside, there appears to be a growing popular belief that many cases of poliomyelitis of a very mild character do occur in elderly people, which are usually unrecognized and which may account for the mysterious spread of the disease.

Very recently, two physicians have mentioned seeing poliomyelitic symptoms in elderly persons.

\* Remarks introduced as a part of the discussion on poliomyelitis at a meeting of the Fifth District Branch of the Medical Society of the State of New York, at Oneida, N Y, October 2, 1924.

## REPORTING COUNTY SOCIETY MEETINGS

We have frequently appealed to presidents and secretaries of county medical societies to send us reports of their meetings for publication in the JOURNAL. The response is progressively gratifying. It is with real pleasure and gratification that we received the following letter

"I have noted for some time that the proceedings of some County Societies are reported quite regularly while those of other counties are never seen printed in the STATE JOURNAL. Is the reporting of its proceedings a matter of option with each Society?"

"From your remarks before the Clinton County Medical Society reported on page 1021 of the December JOURNAL I deduce that you really like to see the County Society proceedings in print, so I shall take the matter up with our County Society. To the best of my recollection it has been a long time since our County

Society proceedings were seen in the JOURNAL reports"

To this we replied as follows

"We certainly want to publish a description of every meeting of every county medical society. The only reason why we do not publish more accounts is that the secretaries do not send us the reports of the meetings. We have published every item that has been sent to us. We have often gone to the meetings and written the reports ourselves.

"We will continue to publish the proceedings until we get so many that they crowd one another off the pages.

"It is up to your Secretary to send us the accounts of your meetings, but you or anybody else can do it."

It occurs to us that this makes a good editorial if we stop right here

## OYSTERS AND TYPHOID FEVER

The newspapers continue to discuss the relation of oysters to typhoid fever, and are carrying reports of investigations by Department of Health and legislative committees. The reports are that one state requires a person ordering raw oysters in a restaurant to sign a paper releasing the restaurant and the Department of Health from all responsibility if the patron comes down with typhoid fever. Another state requires every buyer of oysters to sign a statement that the oysters will not be eaten raw. This wide discussion of danger from shell fish has nearly destroyed the oyster industry. The use of the word shell-fish has also led many people to refuse to buy fish of any kind, and the newspaper reports from New York City indicate that the consumption of fish has been reduced to half the normal amount.

There seems to have been an excess of typhoid fever cases in many of the larger cities in eastern United States, and the incriminating evidence against oysters is that from forty to sixty per cent of the patients have eaten raw oysters within the period of incubation of typhoid fever. Publication of the suspicion against oysters was sufficient to deter people from buying any kind of oysters, regardless of where they were grown.

The Department of Health of New York City has long kept close watch on all the oysters which were brought into the city, and have regularly had bacteriological examinations made on samples taken at random. Colon bacilli are permissible in the liquor of the oysters, the standard relates to the number that are allowed.

Oysters grow in shallow, muddy water, along the coast, their food consists of bacteria, diatoms and other microscopic organisms which they strain out from the water. Sewage acts upon

oysters in the same manner that fertilizer acts on wheat or other crop. Some of the best oyster grounds are in estuaries containing sewage.

Tests have been made to determine how long colon bacteria will remain alive in oysters, and the opinion is that they will disappear after lying about a week in water which is free from colon bacilli. On the contrary, the oysters will take up colon bacilli almost at once when they are put into polluted water, as they often were in years gone by, when the practice was to store them beside opening houses which were located in villages which sewered into the water.

An oyster closes its shell and keeps it closed in the fall when the temperature of the water falls to 40 degrees Fahrenheit. The oyster will then digest the colon bacilli and will be safe for eating even if it was taken from polluted water.

Many attempts have been made to prevent the discharge of sewage into waters in which oysters were grown, but the oystermen have discouraged all publicity along this line, on the ground that their industry would be threatened. Now they are crying loudly for the construction of sewers and the promotion of the purity of the water over the oyster grounds. No department of health can certify the freedom of oysters from pollution so long as sewage is discharged into the water in which they grew. The danger may be remote, but no one can truthfully say there is no danger at all so long as sewage is permitted in the water. Colon bacilli are likely to be found in the oyster liquor, for the drainage from roads and cultivated fields will enter the water, but colon bacilli of human origin can be excluded.

Panics and fear of sickness from eating oysters, and the ruination of the oyster industry will cease when the oystermen and boards of health get together to preserve the purity of the water over the oyster grounds.

---

## DR W DEWEY ELSEVER, AN APPRECIATION

Few men in our community have entered the medical profession with so many of the attributes which go to make up the ideal physician as did Dr W D Elsever. He was equipped with a lovable nature and imbued with the highest ideals. He possessed a noble character and a pleasing personality which he carried with a dignity that inspired affection and confidence among all of those with whom he became associated. He not only inspired his patients with confidence, but he gained their strongest friendship.

His counsel was sought by civic organizations engaged in public welfare work. He was a citizen of the highest type, interested in everything that pertained to the welfare of his fellow-man.

His professional vision was clear, and his judgment sound. Among his medical associates he was regarded as an able consultant and a genial associate. He was a conscientious student and an able teacher.

His untimely death was a great shock to his friends and a distinct loss to the entire community.

F W SEARS.

By GEORGE W. WHITESIDE, Esq  
Counsel, Medical Society of the State of New York

## RETAINED PLACENTA—PUERPERAL SEPTICAEMIA—DEATH

In a recent case tried by your counsel the doctor sued was called upon to treat and care for a young married woman in her early twenties in the birth of her child. The child as born in a little farm house where there were no sanitary facilities of any kind to assist the doctor in his obstetrical procedure. A normal child was born and the two first stages of labor passed off satisfactorily. In the third stage, however, the placenta did not present itself. The doctor, after trying Crede's method for a considerable time, decided to adopt the expectant method rather than to exercise any surgical intervention. All aseptic precautions were adopted in the delivery of the child and before the child was born, and during the second stage of labor a  $1\frac{1}{2}$  ampule of pituitrin was administered by the physician by hypodermic. The woman was delivered of a normal girl child who is now living.

Despite the doctor's repeated and long-continued efforts to expel the placenta by means of Crede's method, he was not successful. The temperature and pulse of the patient continued normal. On the second and third days after the birth of the child, the placenta not having been removed, the doctor again resorted to Crede's method, without success. During this period hot stupes were administered. On the fifth day after the birth of the child the placenta had been expelled from the uterus and lay in the external opening of the vagina, and when found in this position was removed by another doctor who was called in to assist—such removal taking place without the use of any instruments. The woman continued normal for another day, and then her temperature went up. Eight days after the birth of the child the patient died, the cause of death being stated in the death certificate as puerperal septicaemia. The defendant doctor, however, was discharged five days after the birth of the child and did not attend the patient during the last three days of her life.

The theory of the plaintiff's case was that instead of adopting the expectant method, it was the duty of the doctor to have invaded the uterus either by hand or with instruments and to have brought about thereby a manual expulsion of the placenta. Four doctors testified in behalf of the

plaintiff (the husband of the deceased patient), that it was not proper and approved practice to have adopted the expectant method, but that manual intervention should have been employed. Twenty-year-old text-books were cited in support of these opinions. In behalf of the defendant-doctor some four or five physicians were called one of whom was perhaps the leading obstetrician of this State, and the author of many books and articles on the subject of obstetrics. These doctors all testified that the expectant method was the proper procedure and that inasmuch as the lochia, pulse and temperature were normal between the second stage of labor and the final expulsion of the placenta five days after the birth of the child, it not only was not the defendant-doctor's duty to invade the uterus, but that it was his duty not to invade it, that the modern proper and approved practice—a practice which has been definitely recognized during only the last ten or fifteen years, however—is to leave the placenta alone and permit it to be expelled by natural means rather than to attempt manual extraction, provided there was no hemorrhage and all the other conditions of the patient were normal. There was no hemorrhage in this case.

The case attracted wide attention and doctors for many miles distant from the seat of the trial came to the court house in order to hear the evidence. On several days all of the nurses of the local hospital were brought to the court room for the purpose of instruction. In behalf of the defendant's theory numerous textbooks were cited, particularly that of Dr. John Osborn Polak and of Williams on Obstetrics. The case, as will be seen, involved an extremely interesting question of medicine. It emphasized the importance of keeping abreast of the times and at the same time it illustrated the law hazards of medical practice. On the one hand the doctor was condemned for not resorting to a practice which fifteen or twenty years ago unquestionably was the recognized practice, and on the other hand he was commended for not following the old practice, but for adopting the new procedure now thoroughly recognized and approved. The trial lasted for nine days and resulted in a verdict for the defendant doctor.

## ALLEGED FAILURE TO HAVE X-RAY TAKEN AND DIAGNOSE FRACTURE

A woman of advanced years, while crossing the street, was struck by an automobile sustaining an injury to her left arm and shoulder. On August 16th, she consulted a physician with respect to her injuries who, upon examination, found the patient to be extremely nervous and who refused to permit manipulation of the parts to determine the extent of the injury. There was swelling of the arm and shoulder and several abrasions of the skin. Hot boric packs were ordered by the physician. This physician, intending to be absent from the city for several days, requested another physician to visit the patient. The second physician saw the patient on the 17th, 22nd, 23rd and 25th days of August. During all of this time the patient still refused to co-operate with the physician and refused to permit him to make a proper examination to determine the extent of her injury. She also refused the advice of the physician to have X-rays taken. The swelling had partly subsided and the abrasions had healed while under the treatment of the second physician, though the patient still refused to permit the physician to make a proper examination. The first physician returning to the city saw the patient on the 27th of August and the 9th, 17th and 24th days of September. On August 27th, the first physician found that the patient still held her arm rigid and close to her body, the swelling was reduced but the patient still complained of pain. Request for permission to make an extensive examination was refused and the patient also refused to have X-rays taken. During this time the first physician dressed the patient's arm and did whatever was possible in his attempt to heal the patient's injury. He advised the patient that he believed there was a fracture and that in order to determine the same it would be necessary to have an X-ray taken and that the taking of an X-ray was not an operation and was painless. However, the patient refused to have the X-ray taken. After much persuasion the patient finally consented to permit the first physician to take an X-ray and an appointment was made, but the patient failed to keep the appointment, telephoning the physician that she had changed her mind.

On September 24th, a third physician was called in who, in consultation with the first physician, again advised the patient of the necessity of having an X-ray taken, to which the patient finally consented and an X-ray was taken on September 24th. The X-ray disclosed an impacted fracture of the head of the humerus with good apposition and good result.

The patient was last seen by the first physician on the 24th day of September, when she left this

physician and went under the care of another physician.

The patient subsequently instituted an action against the first and second physicians who had attended and treated her, charging them with failure to make a diagnosis of the fracture and having failed to have an X-ray taken and being otherwise generally negligent and careless in their examination, treatment and prescribing for the patient. In her complaint the plaintiff charged that she suffered a subglenoid dislocation and a fracture of the left clavicle at the acromion articulation and a fracture of the scapula, together with a fracture of the upper or rounder end of the humerus where it enters the glenoid cavity, together with other injuries in or about the shoulder joint. She claimed that by reason of the carelessness of the defendants in failing to discover the fracture, the same did not properly knit and there was an impairment of function in her arm and shoulder, and that she was required to expend moneys for medical, nursing and hospital care and attention.

On behalf of the defendants a motion was made requiring the plaintiff to serve separate complaints as against each of the defendants, on the ground that there was a misjoinder of the parties defendant in that each of the physicians attended and treated the plaintiff independent of one another and that they were independent contractors and if liable at all were liable only for their own individual negligence and not for the negligence or carelessness of one another. This motion was granted by the court. The granting of the same was of advantage to the defendants as it required separate trials for each of them and in each of which trials there could only be introduced evidence of what the particular physician did. One of the actions came on for trial, the plaintiff testifying in her own behalf and also introducing medical testimony that what the particular defendant did was not in accordance with the proper and approved practice and that the failure to have an X-ray taken to discover the fracture sustained by the plaintiff resulted in an impairment of the plaintiff's arm. The defendant testified in his own behalf as to his treatment and advice to the plaintiff and the numerous attempts made to have the plaintiff consent to the taking of an X-ray. He also introduced expert medical testimony approving of the treatment and advice given to the plaintiff. At the close of all the evidence the case was submitted to the jury which rendered a verdict in favor of the defendant. After the successful termination of this action, the action against the other physician was discontinued by the plaintiff.

# LEGISLATION

By JAMES N VANDER VEER, M.D.  
*Chairman, Committee on Legislation*

## IN SENATE

Senate Int No 11—A bill introduced in the Senate by Senator Seabury C Mastick of Westchester County, concurrent Assembly Int No 64, introduced in the Assembly by Assemblyman Herbert R. Shonk, of Westchester County, would amend sections 172, 181, Labor Law, by prohibiting employment of females over 16 years of age more than 48 hours a week in factories and mercantile establishments, except that for

not exceeding eight weeks in any year, divided into not more than two periods, females may be employed not more than six days or 54 hours a week, or nine hours a day, provided notice of such extension of working hours be sent to Industrial Commissioner at least three days before

Referred to Labor and Industries Committee of both Houses

*Comment* No progress as yet

## THE NARCOTIC BILL

Senate Int No 115—A bill introduced in the Senate by Senator Morton J Kennedy of New York, concurrent Assembly Int No 215, introduced in the Assembly by Assemblyman Morris Weinfield, of New York, would add new article 22, and amend section 4-b, Public Health Law, and repeals section 1746, Penal Law, relative to habit forming drugs

Referred to Public Health Committee of both Houses

*Comment* No progress as yet

Senate Int No 116—A bill introduced in the Senate by Senator Morton J Kennedy of New York, concurrent Assembly Int No 216, introduced in the Assembly by Assemblyman Morris Weinfield, of New York, would add new section 177, Insanity Law, requiring the licensing of private institutions for treatment of narcotic drug addiction

Referred to General Laws Committee of both Houses

*Comment* No progress as yet

## MEDICAL PRACTICE ACT

A bill introduced in the Senate by Senator John L. Karle, of Queens County, concurrent Assembly Int No 307, introduced by Assemblyman Russell Dunmore, of Oneida County, would amend sections 164, 169, 170, 173, 174, and repeal section 171, Public Health Law, relative to practice of medicine, by providing among other things for the registration and licensing of physicians. Referred to Public Health Committee

Int 211      January 20, 1925  
AN ACT

Introduced by Mr. Karle, read twice and ordered printed  
—and when printed referred to the Committee on Public Health

To amend the public health law, in relation to the practice of medicine

*The People of the State of New York, represented in Senate and Assembly, do enact as follows:*

Section 1 Section one hundred and sixty-four of chapter forty-nine of the laws of nineteen hundred and nine, entitled, "An act in relation to the public health, constituting chapter forty-five

of the consolidated laws," is hereby amended to read as follows

§ 164 *Expenses* The fees derived from the operation of this article, *except as otherwise provided in section one hundred and seventy-three, subdivision five*, shall be paid into the state treasury, and the Legislature shall annually appropriate therefrom for the Education Department an amount sufficient to pay all proper expenses incurred pursuant to this article

Section 2 Section one hundred and sixty-nine is hereby amended to read as follows

§ 169 *Licenses* On receiving from the state board an official report that an applicant has successfully passed the examinations and is recommended for license, the regents shall issue to him a license to practice according to the qualifications of the applicant. Every license shall be issued by the university under seal and shall be signed by the president and secretary of the board and by the officer of the university who approved the credential which admitted the candidate to

examination, and shall state that the licensee has given satisfactory evidence of fitness as to age, character, preliminary and medical education and all other matters required by law, and that after full examination he has been found properly qualified to practice. Applicants examined and licensed in accordance with the provisions of this act, who, when admitted to the licensing examination, were citizens of a foreign country, and who had declared intention of becoming citizens of the United States, shall, upon passing the examination, be issued a license valid for six years from the date of such declaration of intention and upon failure of such licensee to furnish evidence of his having actually become a citizen his license shall become invalid and automatically become revoked and his registration shall be annulled. Applicants examined and licensed by other state examining boards registered by the regents as maintaining standards not lower than those provided by this article and applicants who matriculated in a New York State medical school before June fifth, eighteen hundred and ninety, and who received the degree of doctor of medicine from a registered medical school before August first, eighteen hundred and ninety-five, may without further examination, on payment of twenty-five dollars to the regents and on submitting such evidence as they may require, receive from them an indorsement of their licenses or diplomas conferring all rights and privileges of a regents' license issued after examination. The commissioner of education may in his discretion on the approval of the board of regents indorse a license or diploma of a physician from another state, provided the applicant has met all the preliminary and professional qualifications required for earning a license on examination in this state, has been in reputable practice for a period of ten years, and has reached a position of conceded eminence and authority in his profession. Any physician, who was actually engaged in the practice of medicine in this state prior to September first, eighteen hundred and ninety-one, and who failed to register, although eligible to do so at the time, or any physician, whose registration is not legal because of some error, misunderstanding or unintentional omission, may on the unanimous recommendation of the state board of medical examiners that he has submitted satisfactory proof of having complied with all the requirements prescribed by law at the time of his failure to register, or his incomplete registration, receive from the regents under seal a certificate of the facts which may be registered *in accordance with this act*, [by any county clerk and shall make valid his registration] Before any license is issued it shall be numbered and recorded in a book kept in the regents' office, and its number shall be noted in the license, and a photograph of the licensee filed with the records. This rec-

ord shall be open to public inspection, and in all legal proceedings shall have the same weight as evidence that is given to a record of conveyance of land.

Section 3 Section one hundred and seventy of such chapter is hereby amended to read as follows

§ 170 *Registration* [Registry, revocation of license, annulment of registry. Every license to practice medicine shall, before the licensee begins practice thereunder, be registered in a book kept in the clerk's office of the county where such practice is to be carried on, with name, residence, place and date of birth, and source, number and date of his license to practice. Before registering, each licensee shall file, to be kept in a bound volume in a county clerk's office, an affidavit of the above facts, and also that he is the person named in such license, and had, before receiving the same, complied, with all requirements as to attendance, terms and amount of study and examinations required by law and the rules of the university as preliminary to the conferment thereof, that no money was paid for such license, except the regular fees paid by all applicants therefor, that no fraud, misrepresentation or mistake in any material regard was employed by any one or occurred in order that such license should be conferred. Every license, or if lost a copy thereof legally certified so as to be admissible as evidence, or a duly attested transcript of the record of its conferment, shall before registering, be exhibited to the county clerk, who, only in case it was issued or indorsed as a license under seal by the regents, shall indorse or stamp on it the date and has name preceded by the words "registered as authority to practice medicine in the clerk's office of

county." The clerk shall thereupon give to every physician so registered a transcript of the entries in the register with a certificate, under seal that he has filed the prescribed affidavit. The licensee shall pay to the county clerk a total fee of one dollar for registration, affidavit and certificate. The regents shall have power at any and all times to inquire into the identity of any person claiming to be a licensed or registered physician and after due service of notice in writing, require him to make reasonable proof, satisfactory to them, that he is the person licensed to practice medicine under the license by virtue of which he claims the privilege of this article. When the regents find that a person claiming to be a physician, licensed under this article, is not in fact the person to whom the license was issued, they shall reduce their findings to writing and file them in the office of the clerk of the county in which said person resides or practices medicine. Said certificate shall be prima facie evidence that the person mentioned therein is falsely impersonating a practitioner or a former practitioner of a like or different name

The regents may revoke the license of a practitioner of medicine, or annul his registration, or do both, in any of the following cases

(a) A practitioner of medicine who is guilty of any fraud or deceit in his practice, or who is guilty of a crime or misdemeanor, or who is guilty of any fraud or deceit by which he was admitted to practice, or

(b) Is an habitual drunkard or habitually addicted to the use of morphine, opium, cocaine, or other drugs having a similar effect, or

(c) Who undertakes or engages in any manner or by any ways or means whatsoever, to procure or perform any criminal abortion as the same is defined by section eighty of the penal law, or

(d) Who offers or undertakes by any manner or means to violate any of the provisions of section eleven hundred and forty-two of the penal law

Proceedings for revocation of a license or the annulment of registration shall be begun by filing a written charge or charges against the accused. These charges may be preferred by any person or corporation, or the regents may on their own motion direct the executive officer of the board of regents to prefer said charges. Said charges shall be filed with the executive officer of the board of regents, and a copy thereof filed with the secretary of the board of medical examiners. The board of medical examiners, when charges are preferred, shall designate three of their number as a committee to hear and determine said charges. A time and place for the hearing of said charges shall be fixed by said committee as soon as convenient, and a copy of the charges, together with a notice of the time and place when they will be heard and determined, shall be served upon the accused or his counsel, at least ten days before the date actually fixed for said hearing. Where personal service or service upon counsel can not be effected, and such fact is certified on oath by any person duly authorized to make legal service, the regents shall cause to be published for at least seven times, for at least twenty days prior to the hearing, in two daily papers in the county in which the physician was last known to practice, a notice to the effect that at a definite time and place a hearing will be had for the purpose of hearing charges against the physician upon an application to revoke his license. At said hearing the accused shall have the right to cross-examine the witnesses against him and produce witnesses in his defense, and to appear personally or by counsel. The said committee shall make a written report of its findings and recommendations, to be signed by all its members, and the same shall be forthwith transmitted to the executive officer of the board of regents. If the said committee shall unanimously find that said charges, or any of them are sustained, and shall unanimously recom-

mend that the license of the accused be revoked or his registration be annulled, the regents may thereupon in their discretion, revoke said license or annul said registration, or do both. If the regents shall annul such registration, they shall forthwith transmit to the clerk of the county or counties in which said accused is registered as a physician, a certificate under their seal certifying that such registration has been annulled, and said clerk, shall, upon receipt of said certificate, file the name and forthwith mark said registration "annulled". Any person who shall practice medicine after his registration has been marked "annulled" shall be deemed to have practiced medicine without registration. Where the license of any person has been revoked, or his registration has been annulled as herein provided, the regents may, after the expiration of one year, entertain an application for a new license in like manner as original application for licenses are entertained, and upon such new application they may in their discretion, exempt the applicant from the necessity of undergoing any examination.]

1 Every person now lawfully engaged in the practice of medicine within the state and every person hereafter duly authorized to practice medicine, shall, on or before January first of each year, apply to the secretary of the board of medical examiners for a certificate of registration with the regents of the university upon a blank form which shall be furnished by said secretary and shall pay at such time to said secretary a fee of two dollars, provided that any physician who has registered for five consecutive years hereunder shall register annually without the payment of fee and be so registered during the time he shall thereafter continuously practice medicine in this state

2 A physician in making his first registration hereunder shall write or cause to be written upon the application blank so furnished by said secretary, his full name, post-office and residence address, the date and number of his license and such other facts for the identification of the applicant as a licensed practitioner of medicine as the regents may deem necessary and shall duly execute and verify the same before an officer empowered to take acknowledgments of deeds and deliver the same to said secretary by mail or in person. Subsequent registrations after the first registration need not be upon a sworn application by the applicant unless in a particular case the regents, for reasons satisfactory to them, may require that the application be under oath, such subsequent registration shall be made with as little inconvenience to duly licensed practitioners of medicine as possible and to that end the secretary of the board may employ and use in obtaining such subsequent registration, the assistance of the secretary of duly incorporated medical societies who shall be empowered as a representa-

five of the secretary of the board to receive and transmit such application blanks from physicians after the physicians' first registration, together with the license fees payable upon such applications

3 The secretary of the board, on or before October first of each year, after the first registration, shall mail or cause to be mailed to every physician registered in his office, a blank form of application for registration addressed to the last known post-office address of such physician or may cause such blank form of application to be sent to such physician through the secretary of any duly incorporated medical society. The form of application shall be such as to contain proper spaces for the insertion by the applicant of the information required under paragraph 2 of this section

4 The secretary of the board shall issue to any duly licensed physician in this state, upon his application therefor, in accordance with the provisions hereof, a certificate of registration under the seal of the University for the year ensuing and ending December thirty-first

Upon the first of March in each year, or within ten days thereafter, the secretary of the board shall publish and cause to be mailed to each physician registered hereunder in this state, a printed list of the duly registered physicians in this state and each such published list shall contain at the beginning thereof these words

"Each registered physician receiving this list is requested to report to the secretary of the board and to the secretary of any duly incorporated county medical society existing in the county of his residence or to the secretary of any incorporated state medical society in which said county medical society is represented, the name and address of any person known to be practicing medicine whose name does not appear in this registry. The names of persons giving such information will not be divulged"

The names of physicians which shall in any year be added to said list after the same shall have been so printed and distributed as aforesaid, shall be reported quarterly to the secretary of any duly incorporated state medical society of which county medical societies are components

5 Any licensed physician who having failed or neglected to register by January first of any year as required by the provisions of this section shall be required to pay upon registration, in addition to the fee of two dollars, a further fee of one dollar for each thirty days or part thereof, that he is in default, and any licensed physician who engaged in practice and wilfully refuses or omits to register hereunder, shall be subject to a civil penalty of one dollar for each day that such wilful refusal or omission shall continue, provided that if the same continues for more than thirty days the penalty thereafter shall be five dollars per day so long as the said wilful

refusal or omission shall continue, said penalty shall be recoverable in an action by the attorney-general of the state maintained in the name of the people of the State of New York

6 The penalties provided in this section for failure, neglect or omission of a duly licensed physician to register under this article shall be the only penalties that may be imposed therefor, and the legality of his license shall not be affected thereby, and such penalties may for good cause shown, in the discretion of the regents, upon the recommendation of the board of medical examiners, be remitted or compromised

7 Each licensed physician shall conspicuously display his proper registration certificate in his office at all times

Section 4 Section one hundred and seventy-one of such chapter amended by chapter fifty-three of the laws of nineteen hundred and fifteen, is hereby repealed

Section 5 Section one hundred and seventy-two of such chapter is hereby renumbered section one hundred and seventy-one

Section 6 Section one hundred and seventy-three of such chapter as amended by chapter two hundred and eighty-two of the laws of nineteen hundred and twenty-four is hereby renumbered section one hundred and seventy-two and amended to read as follows

[173] 172 *Construction of this article*  
[This article shall not be construed to affect commissioned medical officers serving in the United States army, navy or marine hospital service, while so commissioned, or any one while actually serving on the resident medical staff of any legally incorporated hospital, or any one while actually serving as an interne in a state hospital or other state institution in which medical service is provided, or any legally registered dentist exclusively engaged in practicing dentistry, or any person or manufacturer who mechanically fits or sells lenses, artificial eyes, limbs, or other apparatus or appliances, or is engaged in the mechanical examination of eyes, for the purpose of constructing or adjusting spectacles, eye-glasses and lenses, or any lawfully qualified physician in other states or countries meeting legally registered physicians in this state in consultation, or any physician residing on a border of a neighboring state and duly licensed under the laws thereof to practice medicine therein whose practice extends into this state and who does not open an office or appoint a place to meet patients or receive calls within this state, or any physician duly registered in one county called to attend isolated cases in another county, but not residing or habitually practicing therein, or the furnishing of medical assistance in case of emergency, or the domestic administration of family remedies, or the practice of chiropody, or the practice of the religious tenets of any church. This article shall be construed to repeal all acts

or parts of acts authorizing conferment of any degree in medicine *causa honoris* or *ad eundem* or otherwise than on students duly graduated after satisfactory completion of a preliminary medical course not less than that required by this article as a condition of license ]

1 *This article shall not be construed so as to prevent the following* (1) *The practice of medicine in this state in obedience with the requirements of the laws of the United States, of any commissioned medical officer serving in the United States army, navy or public health service while engaged in the performance of the actual duties prescribed for him under the United States statutes, or* (2) *the practice of medicine in a duly incorporated hospital operating pursuant to the state charities law, of a duly appointed member of the resident medical staff or of an interne, or* (3) *the practice of medicine by any physician duly licensed to practice medicine in a bordering state, who resides on a border of such neighboring state, whose practice extends into this state and who does not open an office or appoint a place to meet patients or receive calls within this state, or* (4) *any lawfully qualified physician in other states or countries meeting legally registered physicians in this state in consultation, or* (5) *the furnishing of medical assistance in case of emergency, or* (6) *the domestic administration of family remedies, or* (7) *the practice of chiropody, dentistry or veterinary medicine, provided those practicing are legally authorized and licensed under the laws of this state so to do, or* (8) *the practice of the religious tenets of any church, or* (9) *the fitting or selling of lenses, artificial eyes, limbs or other apparatus or appliances by any person or manufacturer of the same or the engaging in the mechanical examination of eyes for the purpose of constructing or adjusting spectacles, eyeglasses and lenses*

II *This article shall be construed to repeal all acts or parts of acts authorizing conferment of any degree in medicine causa honoris or ad eundem or otherwise than on students duly graduated after satisfactory completion of a preliminary medical course not less than that required by this article as a condition of license*

It is further provided that any person who shall be actively engaged in the practice of osteopathy in the State of New York on the thirteenth day of May, nineteen hundred and seven, and who shall present to the board of regents satisfactory evidence that he is a graduate in good standing of a regularly conducted school or college of osteopathy within the United States which at the time of his or her graduation required a course of study of two years or longer, including the subjects of anatomy, physiology, pathology, hygiene, chemistry, obstetrics, diagnosis and the theory and practice of osteopathy, with actual attendance of not less than twenty months, which

facts shall be shown by his or her diploma and affidavit, shall upon application and payment of ten dollars be granted, without examination, a license to practice osteopathy, provided application for such license be made within six months after the thirteenth day of May, nineteen hundred and seven. A license to practice osteopathy shall not permit the holder thereof to administer drugs or perform surgery with the use of instruments. Licenses to practice osteopathy shall be registered in accordance with the provisions of this article, and the word osteopath be included in such registration, and such license shall entitle the holder thereof to the use of the degree D O, or doctor of osteopathy.

Section 7 Section one hundred and seventy-four of such chapter is hereby renumbered section one hundred and seventy-three and amended to read as follows

[174 Penalties and their collection] 173 Penalties [Any person who, not being then lawfully authorized to practice medicine within this state and so registered according to law, shall practice within this state without lawful registration or in violation of any provisions of this article, and any person who shall buy, sell or fraudulently obtain any medical diploma, license, record or registration, or who shall aid or abet such buying, selling or fraudulently obtaining, or who shall practice medicine under cover of any medical diploma, license, record or registration illegally obtained, or signed or issued unlawfully or under fraudulent representations or mistake of fact in a material regard, or who, after conviction of a felony, shall attempt to practice medicine, or shall so practice, and any person who shall in connection with his name use any designation tending to imply or designate him as a practitioner of medicine within the meaning of this article without having registered in accordance therewith, or any person who shall practice medicine or advertise to practice medicine under a name other than his own, or any person not a registered physician who shall advertise to practice medicine, shall be guilty of a misdemeanor. Any person who shall practice medicine under a false or assumed name, or who shall falsely personate another practitioner or former practitioner of a like or different name, shall be guilty of a felony. When any prosecution under this article, or under section eleven hundred and forty-seven of the penal law, and any amendments thereto, is made on the complaint of any incorporated medical society of the state, or any county medical society entitled to representation in a state society, any fines collected shall be paid to the society making the complaint, and any excess of the amount of fines so paid over the expense incurred by the said society in enforcing the medical laws of this state, shall be paid at the end of the year to the county treasurer.]

1 *Any person who shall,*

(a) Sell or fraudulently obtain or furnish any medical or osteopathic diploma, license, record or registration, or aid or abet in the same, or

(b) Practice medicine under cover of any diploma, license, record or registration illegally or fraudulently obtained or signed or issued unlawfully or under fraudulent representation or mistake of fact in a material regard, or

(c) Advertise to practice medicine under a name other than his own or under a false or assumed name, and

2 Any person, who, not being then lawfully licensed and authorized to practice medicine within this state and so registered according to law, shall

(a) Practice or advertise to practice medicine

(b) Use in connection with his name any designation tending to imply or designate as a practitioner of medicine

(c) Use the title "doctor" or any abbreviation thereof in connection with his name or with any trade name in the conduct of any occupation or profession involving or pertaining to the public health, unless duly authorized by law to use the same, and

3 Any person, who during the time his license to practice medicine shall be suspended or revoked shall practice medicine, shall be guilty of a misdemeanor and shall also be subjected to the recovery of civil penalties

Such misdemeanor shall be punishable by imprisonment for not more than one year or a fine of not more than five hundred dollars or by both such fine and imprisonment for each separate violation

4 All courts of special sessions within their respective territorial jurisdictions are hereby empowered to hear, try and determine such crimes without indictment and to impose in full the punishments of fines and imprisonments herein prescribed

Such misdemeanors shall be prosecuted upon the private information of any person by the district attorney of the county wherein the same are committed and at any time the attorney-general may, without further authority or direction, supersede the district attorney in the prosecution of such misdemeanors

5 In addition to the criminal punishments of imprisonment and fine as above provided, a civil penalty is hereby prescribed and imposed which shall be one hundred dollars for each such violation, to be recovered by the attorney general in an action against the party or parties guilty of such violation, which action shall be maintained in the name of the People of the State of New York. Such civil penalties shall be cumulative, a separate penalty being recoverable for each separate violation, and each separate day's violation shall constitute a separate violation for which recovery may be had as above provided. The attorney

general, with the consent of the state commissioner of education may compromise claims for such penalties and accept less than the amount claimed or due before or after an action has been begun. No compromise may be made, however, after decision has been made or a verdict rendered, except pursuant to section thirty-four of the State finance law. Notwithstanding the provisions of any other general, local or special law, all fees, fines, penalties and other moneys derived from the operation of this article shall be paid to the regents of the university and shall be available, together with the appropriations made from time to time by the legislature, for the payment of all proper expenses of the regents, for the administration and enforcement of this act only, including the salary of any deputy attorney general assigned for the purpose of enforcing the provisions of this article. The unexpended balance of all such fees, fines, penalties and other moneys derived from the operation of this article remaining on June thirtieth of each year shall be paid to the state treasury.

After this act shall take effect, the regents shall report to the state comptroller on the fifth day of every month the amounts received by them under this article and remaining in their hands, with all expenditures made by them for the preceding month.

6 Judgments for civil penalties recovered under this article may be enforced by execution against the person as provided in the civil practice act. A person taken into custody under such an execution shall not be admitted to the liberties of the jails and shall be confined, Sundays and legal holidays included, for not less than one day and at the rate of one day for each dollar of the amount of the judgment recovered for civil penalties and costs and remaining unpaid. No person shall be imprisoned more than once or for more than six months on the same judgment. The provisions of this article relative to imprisonment for such debts shall be exclusive and the provisions of the debtor and creditor law and of section seventy-two of the civil rights law shall have no application and prosecutions for a crime under this article shall not bar prosecutions for civil penalties.

7 The display of a sign or an advertisement bearing a person's name as a practitioner of medicine in any manner or by implication or containing any other matter forbidden by law shall be presumptive evidence in any prosecution or hearing that the person whose name is so borne is responsible for the display of such sign or advertisement and of a holding out and of the practice of medicine by such person for each separate day such sign or advertisement is anywhere displayed by anyone, but such presumptions are rebuttable by the defense. It shall be necessary to prove in any prosecution or hearing under this article only a single act prohibited by law or a

single holding out or an attempt, without proving a general course of conduct, in order to constitute a violation

8 In any action for damages for personal injuries or death against a person not licensed hereunder for any act or acts constituting the practice of medicine as herein defined, where such injuries or death were contributed to by such act or acts, the fact that such person practiced medicine as herein defined without being duly licensed shall be deemed *prima facie* evidence of negligence

9 All violations of this act when reported to the regents and duly substantiated by affidavits or other satisfactory evidence, shall be investigated and if the report is found to be true and the complaint substantiated, the regents shall report such violation to the attorney-general or district attorney and request prompt prosecution. The regents may appoint such inspectors as are necessary to be paid from the funds received under this act at such salaries as the regents may determine and it shall be the duty of such inspectors under the direction of the regents, to investigate promptly and thoroughly such violations and to procure where possible legal evidence of the same for prosecution of the offenders

Section 8 Article eight of such chapter is hereby amended by adding thereto a new section to be known as section one hundred and seventy-four to read as follows

§174 Revocation of certificates and annulment of registrations

1 Whenever any practitioner of medicine shall be convicted of a felony, there may be presented to the regents a certified or exemplified copy of the judgment of such conviction and thereupon the registration of the person so convicted shall be annulled and his license revoked

Upon reversal of the conviction of such practitioner the regents shall upon receipt of a certified copy of the judgment or order of reversal vacate their order of revocation and annulment of registration but nothing herein contained shall divest the regents of power to proceed against such practitioner under the next subdivision

2 The regents may revoke or suspend the license of a practitioner of medicine and annul his registration or reprimand or discipline as in their discretion they may deem best for the public interest in any of the following cases

Upon finding after due hearing

a That a physician is guilty of fraud or deceit in the practice of medicine or in his admission to the practice of medicine or in his procuring registration, or

b That a physician has been convicted in a court of competent jurisdiction, either within or without this state, of a crime involving moral turpitude, or

c That a physician is a habitual drunkard, or addicted to the use of morphine, cocaine or

other drugs having a similar effect, or has become insane, or

d That a physician is guilty of untrue, fraudulent, misleading or deceptive advertising; or advertising that he can cure diseases which are recognized by the medical profession as incurable, or advertising that he can cure or treat disease by a secret method, procedure, treatment or medicine, or that he can treat, operate or prescribe for any human condition by a method, means or procedure which he refuses to divulge upon demand to the regents, or

e Who undertakes or engages in any manner or by any ways or means whatsoever to procure or perform any criminal abortion as same is defined by the Penal Law

3 Proceedings for revocation of a license, suspension of a practitioner from practice or the annulment of registration under subdivision two of this section shall be begun by filing a written charge or charges against the accused. These charges may be preferred by any person, corporation of public officer, or by the executive officer of the board of regents. Any charges shall be filed with the commissioner of education and a copy thereof filed with the secretary of the board of medical examiners. The president of the board of medical examiners, when charges are preferred, shall designate three of its members as a committee to hear and determine said charges and such committee shall contain at least one member who represents the same school of practice as the physician against whom the charges are preferred. A time and place for the hearing of said charges shall be fixed by said committee as soon as convenient, and a copy of the charges, together with a notice of the time and place when they will be heard and determined, shall be served upon the accused or his counsel at least ten days before the date actually fixed for said hearing. Where personal service or service upon counsel cannot be effected, and such fact is certified on oath by any person duly authorized to make legal service, the secretary of the board of medical examiners shall cause to be published for at least four times, at least thirty days prior to the hearing, a notice of hearing, in a newspaper published in the county in which the physician was last known to practice, and a copy of such notice shall also be mailed to the accused at his last known address. All such notices of charges shall contain a plain and concise statement of the material facts, without unnecessary repetition, but not the evidence by which the charges are to be proven, with a notification that a stenographic record of such proceedings will be kept and that the accused will have opportunity to appear either personally or by counsel at the hearing, with the right to produce witnesses and evidence upon his own behalf, to cross-examine such witnesses, to

examine such evidence as may be produced against him and to have subpoenas issued by the board. The said committee shall make a written report of its findings and recommendations, to be signed by all its members, and the same shall be forthwith transmitted to the board of regents with the entire record and evidence. If the said committee shall unanimously find that said charges, or any of them, are sustained, and shall unanimously recommend that the license of the accused be revoked or the practitioner suspended from practice, and his registration annulled, or that he be otherwise reprimanded or disciplined, the regents may thereupon in their absolute discretion, revoke or suspend said license and annul said registration or otherwise reprimand or discipline as in their absolute discretion they may deem best for the public interest, provided that no greater penalty than that recommended by said committee be imposed. Where the license of any person has been revoked, or his registration has been annulled as herein provided, the regents may, after the expiration of one year, entertain an application for a restoration of license and registration, in like manner as original applications for licenses are entertained, and upon such new application they may in their discretion, exempt the applicant from the necessity of undergoing any examination. The regents may in their discretion restore to good standing any physician who has been suspended from practice.

4 Any licensed practitioner found guilty under the provisions of this section on charges or whose license is otherwise revoked or suspended or registration annulled, or who has been refused registration, or who is otherwise reprimanded or disciplined by the board of regents under this article shall have an order of certiorari for the purpose of reviewing such determination returnable before the appellate division of the

judicial department where the board of regents made the determination complained of, but no such determination of the board of regents shall be stayed or enjoined except upon application to such appellate division, after notice to the state commissioner of education, and upon a showing that the determination of the board of regents was clearly wrong, that the constitutional rights of the applicant have been violated or that the board of regents made its determination without jurisdiction. The board of medical examiners or the board of regents may issue subpoenas and administer oaths pursuant to section sixty-one of the public officers law in connection with any hearing or investigation under this article and it shall be the duty of such boards to issue subpoenas at the request of and upon behalf of the defense.

§ 7 This act shall take effect July first, nineteen hundred and twenty-five

Senate Int No 228—A bill introduced in the Senate by Senator J Griswold Webb, Clinton Corners, N Y, concurrent Assembly Int No 236, introduced by Assemblyman T C Moore, of Westchester County, would add new section 16-a, empowering State Charities Board among other things, to visit and inspect all institutions in which children are received or cared for, and to establish rules therefor.

Referred to General Laws Committee

Comment None as yet

Senate Int No 266—A bill introduced in the Senate by Senator James S Truman, of Owego, N Y, would amend subdivision 9, section 15, Workmen's Compensation Law, by providing for expenses for rehabilitating injured employees, not more than \$10 per week to be spent for maintenance.

Referred to Labor and Industries Committee.

Comment None as yet

## IN ASSEMBLY

Assembly Int No 64—Concurrent Senate Int No 11 See Senate Bill for digest and comment

Comment None as yet

Assembly Int No 120—A bill introduced in the Assembly by Assemblyman Joseph Reich of Kings County, would add new section 213, Labor Law, requiring employers to furnish nursing and first aid service in factories, mercantile and other establishments.

(Same as Int No 309 of 1924)

Referred to Labor and Industries Committee.

Comment

Assembly Int No 125—A bill introduced in the Assembly by Assemblyman Joseph Reich, of Kings County, would add new subdivision 10-a, Section 360, Tax Law, by permitting deductions from income for tax purposes of all expenses paid during the year for medical, surgical or dental services. (Same as A. Int 65 of 1924)

Referred to Taxation and Retrenchment Committee.

Comment No progress as yet.

## SCHOOLS BILL

would amend section 10, by providing that b

are necessary to consider this law or a

cation and trustees shall appoint physicians and dentists and may employ nurses for service in schools

Referred to Public Education Committee

*Comment* No progress as yet

Assembly Int No 152—A bill introduced in the Assembly by Assemblyman Morris Weinfeld, of New York, would amend section 13, Workmen's Compensation Law, by striking out provision that claim for medical treatment shall not be valid against employer unless physician within 20 days following first treatment furnish report of injury

(Same as A Int 717 of 1924)

Referred to Labor and Industries Committee

*Comment* No progress as yet

Assembly Int No 184—A bill introduced in the Assembly by Assemblyman F A Miller, of Kings County, would amend section 118, Workmen's Compensation Law, by authorizing physical examinations and practical tests of claimant to determine loss of use and proportionate loss of use of a member, result and test to be part of record

(Same as Senate Int 468 of 1924)

Referred to Labor and Industries Committee

*Comment* No progress as yet

### THE CHIROPRACTIC BILL

Assembly Int No 185—A bill introduced in the Assembly by Assemblyman William M Nicoll of Schenectady, to define and regulate the

practice of chiropractic

Referred to Public Health Committee

*Comment* No progress as yet

### THE NARCOTIC BILL

Assembly Int No 215—Concurrent Senate Int. No 115

See Senate Bill for digest and comment

Assembly Int No 216—See concurrent Senate Bill Int No 116 for digest and comment

Assembly Int No 229—A bill introduced in the Assembly by Assemblyman A Spencer Feld of New York City, would add new section 579-b, Education Law, providing for county supervisors to supervise education of children with retarded mental development

Referred to Public Education Committee

*Comment* Deferred until later

Assembly Int No 233—A bill introduced in the Assembly by Assemblyman Paul Kammerer of New York City, it would amend section 28, Workmen's Compensation Law, by authorizing industrial board to permit claim for compensation to be filed within two years after accident or death

(Same as A Int 48 of 1924)

Referred to Labor and Industries Committee

*Comment* Deferred until later

Assembly Int No 236—Concurrent Senate Int No 228 See Senate Bill for digest and comment

Assembly Int No 237—A bill introduced in the Assembly by Assemblyman T C Moore, of Westchester County, would add new section 16-b, State Charities Law, empowering State Charities Board to visit and inspect places where children, for appearance in court, are held, and to publish rules therefor

Referred to Judiciary Committee

*Comment* Deferred until later

Assembly Int No 301—A bill introduced in the Assembly by Assemblyman C P Miller, of Genesee County, would add new article 4-a, Workmen's Compensation Law, relative to fibroid phthisis (silicosis)

the Assembly by Assemblyman Frank Lattin, of Orleans County, would amend section 13, Workmen's Compensation Law, by permitting injured employees, at employer's expense, to engage medical or other attendance

(Same as A Int No 1508 of 1924)

Referred to Labor and Industries Committee

*Comment* Deferred until later

Assembly Int No 302—A bill introduced in the Assembly by Assemblyman Lewis Stapley of Livingston County, would add new section 151, Labor Law, permitting employment of females at night in any occupation in which it is lawful for males to work at night

(Same as A Int 571 of 1924)

Referred to Labor and Industries Committee

*Comment* None as yet

Assembly Int No 307—Concurrent Senate Int No 211 See Senate Bill for digest and comment

Assembly Int No 384—A bill introduced in the Assembly by Assemblyman Sam Mandlebaum of New York City, would add new section 1097-a, Greater New York Charter, requiring education board to furnish free eye glasses to school children unable to pay therefor

Referred to Cities Committee

*Comment* None as yet

Assembly Int No 396—A bill introduced in the Assembly by Assemblyman C P Miller, of Genesee County, would add new article 4-a, Workmen's Compensation Law, relative to fibroid phthisis (silicosis)

Referred to Labor and Industries Committee

## WORKMEN'S COMPENSATION

IN ASSEMBLY  
AN ACT

January 22, 1925

To amend the workmen's compensation law, in relation to fibroid phthisis (Silicosis)

Section 1 Chapter eight hundred and sixteen of the laws of nineteen hundred and thirteen, entitled "An act in relation to assuring compensation for injuries or death of certain employees in the course of their employment, and repealing certain sections of the labor law relating thereto, constituting chapter sixty-seven of the consolidated laws," as re-enacted by chapter forty-one of the laws of nineteen hundred and fourteen, and further re-enacted and amended by chapter six hundred and fifteen of the laws of nineteen hundred and twenty-two, is hereby amended by the insertion therein of a new article, to be article four-a, to read as follows

## ARTICLE 4-A

*Fibroid Phthisis (Silicosis)*

## Section 60 Definitions

- " 61 Fibroid phthisis (silicosis) treated as accident
- " 62 Limitation of employments
- " 63 Right to compensation
- " 64 Duties of employers
- " 65 Duties of employees
- " 66 Medical examinations
- " 67 Board of Examining Physicians
- " 68 Date of disablement
- " 69 Compensation, how payable
- " 70 Compensation, when not payable
- " 71 Diseases which are accidents

§ 60 Definitions Whenever used in this article

1 "Fibroid phthisis" means an inelastic fibrous condition of the lung tissue caused by the inhalation of particles of free crystalline silica, which shall be referred to as "silicosis"

2 "Ante-primary stage" means that physical signs of damage to the lungs, short of definite physical signs of silicosis, have become evident and that such damage has supervened during and in consequence of employment in any of the employments enumerated herein,

3 "Primary stage" means that definite and specific physical signs of silicosis are or have been present and that capacity for work is or has been impaired by that disease in consequence of employment in any of the employments enumerated herein, though not seriously and permanently,

4 "Secondary stage" means that definite and specific physical signs of silicosis are or have been present and that capacity for work is

seriously and permanently partially impaired by the disease in consequence of employment in any of the employments enumerated herein, but that the employee is not totally permanently disabled and can engage in other employment,

5 "Final stage" means that definite and specific physical signs of silicosis are or have been present and that capacity for work has been totally and permanently impaired by the disease in consequence of employment in any of the employments enumerated herein, and that employee cannot engage in any employment

6 "Suspended" means that an employee, or an applicant for employment, in one of the employments enumerated herein has been examined by a physician and his physical condition has been found to be such that he should not engage in any of the employments enumerated herein, and that such employee has been apprised of his physical condition and advised not to engage in such employments

§ 61 Fibroid phthisis (silicosis) treated as accident The disablement of an employee engaged in any of the employments enumerated in section sixty-two resulting in fibroid phthisis (silicosis) as herein defined shall be treated as the happening of an accident within the meaning of this chapter, and the practice and procedure provided in this chapter shall apply to all proceedings under this article, except where specifically otherwise provided herein

§ 62 Limitation of employments Notwithstanding the provisions of any other section of this chapter, the application of this article shall be limited to the following occupations or employments Miners, quarrymen, and tunnel workers, stone masons' work and granite cutting, pottery workers, and persons employed in the manufacture of refractory silica bricks and flint knapping

§ 63 Right to compensation If an employee is disabled or dies and his disability or death is caused by silicosis as defined herein, and the disease is due to the nature of the employment as herein described, he or his dependants shall be entitled to compensation in accordance with the provisions of this article

§ 64 Duties of employers It shall be the duty of every employer in any of the employments enumerated herein

1 To cause to have made a medical examination of every person in his employ who is exposed to silica dusts, within three months after this article takes effect, to cause to have made a medical examination of every applicant for employment in any process where silica dusts exist, to cause to have made a biennial medical examination of every person in his employ who is

exposed to silica dusts, at such time and in such manner as the commissioner shall determine. If such medical examination shall disclose evidence of silicosis in any stage the employee or the applicant for employment shall be suspended.

2 To refuse employment to any person in any process wherein silica dusts exist if the medical examination discloses (a) that the chest is not of average development with satisfactory expansion, (b) that there is a deformity or obstruction of the upper air passages or elsewhere which interferes with respiration, (c) that there are signs of present or past disease of the lungs or heart, (d) that there are signs of present or past tuberculosis of any region.

3 To use every reasonable means to exhaust or so dispose of silica dusts as to minimize the hazard.

4 Violation of this section shall constitute a misdemeanor punishable for the first offense, by a fine of fifty dollars, for the second offense by a fine of one hundred dollars, and for the third offense by a fine of one thousand dollars or one year in jail, or both.

The industrial board shall prescribe forms or make rules for carrying into effect the provisions of this section.

§ 65 Duties of employees. It shall be the duty of every employee or applicant for employment in any of the employments enumerated herein.

1 To submit himself to medical examination as herein provided,

2 To furnish true information to his employer or prospective employer regarding his past employment in the employments enumerated herein.

The industrial board shall, if necessary, make rules for carrying into effect the provisions of this section.

§ 66 Medical examinations. There shall be a written report for every medical examination made under the provisions of this article, in which the physician shall definitely certify to what degree, if any, the general physical capacity of the employee or the applicant for employment is impaired by silicosis. The employer or the employee, as a matter of right, may demand and shall receive a re-examination and a further report from the Board of Examining Physicians. All medical examinations and reports shall be made in accordance with rules prescribed by the industrial board.

§ 67 Board of Examining Physicians. The industrial board shall name a board of examining physicians, to consist of three physicians, graduates of a recognized medical college and with at least five years actual practice, who shall specialize in the diagnosis and treatment of silicosis, and to whom shall be referred only cases involving controversies in relation to the medical aspects of claims arising under this article, unless otherwise herein provided. The industrial board shall fix the fees of members of the Board of

Examining Physicians and shall prescribe their duties within the limitations of this section.

§ 68 Date of disablement. For the purposes of this article the date of disablement shall be such date as the industrial board may determine on the hearing on the claim.

§ 69 Compensation, how payable. Compensation shall be payable under this article either in a lump sum or in weekly payments as the industrial board shall determine in accordance with the following schedule.

1 For an employee whose disability has been diagnosed as the ante-primary stage of silicosis, twenty-six weeks compensation,

2 For an employee whose disability has been diagnosed as the primary stage of silicosis, fifty-two weeks compensation,

3 For an employee whose disability has been diagnosed as the secondary stage of silicosis, one hundred and four weeks compensation,

4 For an employee whose disability has been diagnosed as the final stage of silicosis, five hundred and twenty weeks compensation.

§ 70 Compensation, when not payable. No compensation shall be paid for the death or disablement of any employee who re-engages in any of the employments enumerated herein after he has been suspended, nor to any applicant for employment whose application has been refused but who engages in any of the employments enumerated herein.

Neither the employee nor his dependents shall be entitled to compensation for death or disability resulting from silicosis unless the disease is due to the nature of the employment and unless he shall have been employed continuously for five years in any of the employments enumerated in this article.

It being the policy and intent of this article to debar from employment in any of the employments enumerated herein for the protection of their health and the conservation of their capacity for work, any persons found to be physically unfit, an award of compensation hereunder shall be deemed to be final and no claim for compensation for death or disability from silicosis thereafter shall be valid and no further compensation shall be paid, provided, however, that nothing herein stated shall affect the rights of an employee to recover compensation in respect to an accidental injury or death arising out of and in the course of his employment in any other occupation than those enumerated in this article.

§ 71 Diseases which are accidents. Nothing in this article shall affect the rights of an employee to recover compensation in respect to a disease to which this article does not apply if the disease is an accidental personal injury within the meaning of subdivision seven of section two of this chapter.

§ 2 This act shall take effect January 1, 1926.

# State Department of Health

## SALE OF TETRAETHYL LEAD RESTRICTED

At a meeting of the Public Health Council of the State, held on January 20th, Chapter VII of the Sanitary Code was amended by adding thereto a new regulation to be known as Regulation 16, to take effect March 1st, 1925, and to read as follows

"The sale or distribution of tetraethyl lead in concentrated form, except in refineries, bulk stations or filling stations, is hereby prohibited. Such sale or distribution shall be made in safe, sealed containers

"Nothing herein contained shall be construed to prevent the sale or distribution of tetraethyl lead in concentrated form for experimental and research purposes or for use under special circumstances to persons whose applications therefor have been approved by the Commissioner of Health of the State of New York."

## SOME LOST OPPORTUNITIES

According to a report received recently a surgeon, by advising against a gall-bladder operation on a known typhoid carrier, neglected a splendid opportunity to serve the interests of public health

In the summer of 1924, this carrier, a woman, who had typhoid fever in 1921, suffered a severe attack of gallstone colic, and agreed to have an operation. On her arrival at the hospital she came under the care of the surgeon in question. In spite of the fact that the woman was a known carrier, the surgeon had two fecal specimens from the patient examined at the hospital laboratory. A third specimen was sent to the State Laboratory. All three specimens were reported negative. He failed, however, to elicit the history of typhoid cases following in her wake which was in possession of the local and state health authorities and advised against operation on the basis of the negative laboratory findings. His advice was accepted, and the woman left the hospital.

A month later another fecal specimen was obtained and an examination at the State Laboratory showed that it contained *B typhosus*. In view of the large proportion of cases in which removal of the gall-bladder and appendix results in terminating the carrier condition, it is greatly to be regretted that the operation was not performed on this carrier on the chance of bringing

to an end the path of devastation that she has left. It is hoped that she may again consent to an operation as it is known that since 1921 she has been the cause of eight, possibly nine, cases of typhoid fever, with two deaths.

Among other lost opportunities in connection with this carrier may be mentioned the fact that at least three of the typhoid patients among her relatives had refused to be vaccinated against the disease.

This case is illustrative of the fallacy of concluding that a chronic typhoid carrier is no longer a carrier, even if a number of negative specimens are obtained. It serves further to justify the policy of the State Department of Health in refusing to consider a chronic carrier to be free from infection until the gall-bladder has been removed, and a series of negative specimens subsequently has been obtained.

## PROPHYLAXIS FOR VENEREAL INFECTION

Medical Prophylaxis was the topic most discussed at the recent conference of Venereal Disease Control Officers held at Hot Springs, Arkansas.

While the so-called American plan for venereal disease control has progressed steadily, is practical and has secured public support, most of the officials who attended the meeting apparently believe that earlier treatment and a disinfection of those exposed, in order to limit the number of new infections, should be encouraged. All agreed that there was convincing evidence that early disinfection *under the supervision of a physician* within an hour of exposure will reduce infection to a negligible degree and that promiscuity will not be increased thereby.

Twenty-five states were represented at the conference and amongst the specialists who were present as consultants were Dr William Allen Pussy, President of the American Medical Association, Dr John H Stokes of the University of Pennsylvania, late of the Mayo Institute, Dr George W Walker, Johns Hopkins University, Dr William F Snow, President of the American Social Hygiene Association and Dr Mark J White, representing the Surgeon General of the Public Health Service, who was the permanent Chairman.

# NEWS NOTES

## PERIODIC HEALTH EXAMINATIONS

A radio talk by Orrin Sage Wightman, M.D., Chairman of the Periodic Examination Committee of the Medical Society of the County of New York, broadcasted from Station W.E.A.F. on January 20, 1925

### *Ladies and Gentlemen of the Radio Audience*

In coming before you as the representative of the Committee on Periodic Health Examination of the Medical Society of the County of New York, I feel deeply responsible as the representative of 3,200 physicians who belong to that Society. It is the largest County Society in the State of New York, and contains about one-third of the State membership.

The County Society is a part of the State Society, which in turn is a part of our National organization known as the American Medical Association. We are thus welded by County, State and Nation into a serious-minded profession which is conservative and at the same time takes seriously the responsibility of our civic and professional duty toward City, State and Nation. The present idea of our County Society is to offer our united thought on Periodic Health Examination, and of so organizing this work that it will admit of greater distribution in both State and Nation.

You all know that it is the aim of every municipality and state to conserve the health of the community. We have been enabled through the painstaking work, and the organization of well known foundations and institutions of research, like the Rockefeller, Carnegie, Milbank, New York Tuberculosis and others, to make a careful study of the causes of disease. An immense amount of money has been invested by our great philanthropists in this way—and I would say well invested, as countless lives have been saved as a result. As its personal contribution to this task, the Medical Profession has given unselfish devotion, and even life itself, in an attempt to discover the causes of disease. But a few short years ago, one of our number, by allowing himself to be bitten by a mosquito infected with yellow fever, told humanity how others could escape the plague of this dread disease. Both here and abroad medical men have been willing to devote their lives for a comparatively small monetary return, in their enthusiastic desire to discover the cause of a baffling disorder.

How is it possible to compute the value of typhoid vaccine as a prophylactic measure, in the prevention of this disease? Do you know that in the Spanish-American War, more men died of typhoid than under fire? And yet in the recent World War, where proper prophylactic measures were taken, there is little or no mention of this

terrible scourge, in spite of the millions of men who were mobilized all over the world.

This is a simple instance of the possibilities of preventive medicine.

We all know that fresh air and sunlight, and proper living quarters make for happiness and longer life. The Department of Health in this great city of ours, under an able leadership, has for years by constant watchfulness been a bulwark of strength in combating the destructive forces of ill health. It is constantly awake to the dangers of the water and milk supplies. It has all food inspected most rigidly, sends its agents and inspectors at the slightest suspicion or alarm, and in the event of an epidemic, is soon master of the situation.

Again, this is preventative medicine.

Whenever a new cure is brought to the attention of the community, everyone becomes interested. Here in particular the medical profession is true to its trust. They are often criticized severely when they will not accept many indigestible frauds which charlatans deal out to a gullible following. They are accused of prejudice, ignorance, jealousy and personal gain—but in spite of cults, quacks and frauds of every type, they pursue the even tenor of their way, knowing the life of the faddist is short, and all of the people cannot be fooled all of the time.

How gladly would all of us welcome an easy and sure cure for tuberculosis! How anxiously are we awaiting the time when we can definitely state the cause of cancer, its curtailment and positive cure, and in the same way one might go through many diseases which at present are not clearly understood, and state that the ambition of every physician is to leave something behind him which would really help his fellow-man to live longer, and save him needless suffering and misery.

I question whether the public at large knows how seriously medical men consider the science of medicine rather than its income. You often hear people complain of fees or charges made by physicians, not realizing that those same men have devoted the best years of early manhood to education and training so that they could better understand the diagnosis and treatment of human ailments. It is commonly reported that it costs about \$20,000 to train a good salesman in a large wholesale house. Now it is well to consider that a physician reaches twenty-eight or thirty years

of age before he is able to secure the collegiate, medical and hospital training which is considered necessary to make him a suitable candidate for the degree of M D

His college course is four years, his medical course is four years, with one or two years in a hospital, making ten years in all. This is preliminary training before a physician is presumed to have a modern education which is adequate and accepted by the Regents of the State of New York as a legal requirement in the practice of medicine. By careful adjustment of college and medical work this may be accomplished in eight years. After all, this is a long while. I state these facts frankly because the public treats too lightly what should be a proper return on the investment of a medical education.

The Periodic Health Examination has meant a very marked step in the advance of the practice of medicine. We previously were content to diagnose disease and attempt its treatment and cure. This meant that symptoms of more serious intent had many minor phases before reaching a dangerous stage, and the patient usually delayed taking himself to the doctor. For this reason our public hospitals are full of really sick people. Under these conditions modern medicine is beginning to realize that it is important for the patient to know and be guarded through pre-clinical signs, and not wait until a disease is well developed before attempting its cure. How much better for us if we could anticipate and prepare for a contingency, if we had any indication that it was threatening us. This in brief is pre-clinical medicine.

Our desire is to bring the family physician not only in closer touch with his patient, but to prepare him so that when his patient comes for more definite physical findings, the physician will be in a position to feel his responsibility toward his patient and thus insure his future usefulness to himself and the community.

There is nobody so close to the family as its physician. He knows, through years of intimate contact, the peculiarities common to the family, he knows in some instances what the parents and grandparents died of, he knows the mental idiosyncrasies as well as the physical shortcomings, and he is in a most strategic position to warn his health client of the pitfalls which may be waiting for him if he goes along without due consideration of his health. The family physician is particularly well equipped to make the necessary physical examinations. He has the background of a careful medical education.

The Medical Society of the County of New York is starting a periodic health program for physicians, which includes the necessary lectures and opportunities for special talks to physicians who are interested in this work. It offers courses of a post-graduate nature. It further offers a large list of bibliography from which the physician can find out what has been written and done

and thought by other physicians in the same field. And more than that, it offers the big idea of the pre-clinical finding of disease before it has fastened itself too firmly upon the individual.

There is no desire on the part of the medical profession to make this a mercenary procedure. The physician is worthy of his hire just as every other professional man is. It cannot be done for nothing. People are apt to make every provision for their future along other lines and totally disregard the possibility of ill-health. The fact that they feel well at the time carries unconsciously the idea that good health will continue forever, and that little time need be given to its future consideration.

We would ask everybody to seriously consider whether they are as healthy as they are entitled to be, and whether some slight correction would not be for their betterment and comfort. Do they realize whether they are underweight or overweight, or whether they are harboring circulatory diseases peculiar to their family, or possibly some weakness of the lungs, or some other hereditary or family peculiarity which at the present time could be easily remedied, or at least corrected, and save them much future worry and annoyance, possibly life itself?

Our intent is not to frighten anyone into an imaginary sickness. We merely urge stock-taking, and to be truly effective, this should occur once a year or once every two or three years.

It is a strange fact that we are willing to watch everything but our health. We spend hours over the consideration of an investment, look most exhaustively into the value of a stock, choose the schools and the homes for our wives and children, are most anxious about the friends our families make, the theatres they attend and the movies they go to see. And yet, when it comes to a matter of health, we choose to be entirely oblivious as to our future and seem to have a terrifying sense that we might discover some hidden ailment, and hence prefer to be left in ignorance.

The Chinese have a habit of hiding the afflicted member when it is disabled under the bedclothes, feeling that if it is out of sight it will cause a disappearance of the disease. Modern methods have required that if we want to live longer and be healthier, we should have this rating made at definite intervals. Most of the time you will find there is nothing wrong with you. Statistics have proven that it is really worth while, that the saving of human life, the saving of future misery and discomfort is incalculable.

We trust that all who may be within hearing will not be frightened or fear that they have anything to worry about by a simple taking of stock. If you have nothing the matter with you, it will show itself very promptly. If you have something the matter with you, you ought to know about it. The majority of people will come through with a clean bill of health. And when through any of our public utterances, through

broadcasting or in the public press the subject of Periodic Health Examination is mentioned, think of your own particular case and decide to have your family doctor look you over carefully, scientifically, and with no desire to either hide or terrify, but with a good, honest statement as to

your physical assets. This will be an hour well spent, not only for its effect upon you, but for the effect it may have upon your family and friends. Your family physician is a safe and sound person to whom you may entrust your health and physical welfare.

## THE NOSE, THROAT AND EAR IN PRE-CLINICAL SIGNS OF DISEASE

By DANIEL DOUGHERTY, M.D.,  
NEW YORK.

Abstract of the Tenth Lecture in the Symposium on the Pre-clinical Signs of Disease conducted by the Medical Society of the County of New York, given January 20, 1925

It is well known that abnormal conditions of the upper respiratory tract often affect the health of the whole body. Let us briefly consider those local conditions which should influence us in the expression of an opinion regarding the present and future health of those examined. Every physician is aware of the signs of diseased tonsils, and of their effects on general health. An examination of the tonsils is usually made by every examiner. Physicians are generally aware of the signs of and effects of chronic disease of the nasal sinuses. We will dwell today on some of the more obscure signs of local conditions which affect general health.

### COUGH

Cough is the most frequent and the most deceiving symptom with which an examiner has to deal. It is caused by a stimulation conducted by the vagus nerve. Since branches of this nerve are widely distributed and are in close connection with nerves from the ear, nose, throat, chest, stomach and the sympathetic nervous system, reflex irritation of widely separated organs may produce a cough.

A physician who is examining a coughing patient will of course look over the lungs carefully. He will next consider the larynx where he will need to keep in mind a variety of irritating conditions of inflammation, ulceration, foreign bodies, neoplasms and neuroses. Each of these conditions has its suggestive signs which will lead the skillful specialist to make a careful examination of the larynx. But whether the physician is a specialist or a general practitioner, he must remember that signs and symptoms which seem to point to a localization of a disorder in the larynx may be only a local manifestation of a general condition. There is for example a so-called nervous cough with apparently laryngeal irritation associated with neurasthenia and hysteria, and there is a dry cough associated with laryngeal chorea.

The pharynx can be readily inspected by the general practitioner, and chronic inflammations, and ulcerations can easily be seen and recognized. A paralysis of the pharyngeal muscles may produce a cough from food irritation. Tonsils

which are hypertrophied may press upon the phrenic and recurrent nerves and be a sufficient cause of troublesome cough. The lingual tonsil and the uvula may also cause a cough. A cough may be caused by almost any abnormal nasal condition as would be expected from the nerve supply of the nose. A general examination will include an inspection of the nose, and if an abnormal condition is found, it may be necessary to refer the patient to a specialist who has the equipment and facilities for making a thorough examination of the turbinates and sinuses.

It must also be remembered that the vagus nerve is distributed to the abdominal organs, and that a cough may be one of the symptoms of gallstones, tapeworm, nephritis or genito-urinary irritation. Cough may mean the presence of an aneurism or cardiac disease, it may be caused by irritation of the auditory branch of the vagus, as by impacted wax in the external ear. Cough may be caused by basilar meningitis, or cranial abscess, or a tumor of the cerebellum.

Since cough is a sign which is evident and annoying to the person examined, the examiner will need to have in mind the numerous conditions which produce the symptom in order to give an intelligent opinion regarding it.

### HOARSENESS

Under hoarseness we may consider all changes in the natural voice from a slight vocal weakness to complete loss of voice. A change in the voice is suggestive of disorders in other organs besides the larynx. Vocal resonance is derived from the nose, the sinuses and the pharynx and any diseased condition in them will often be indicated by a change in the voice.

In all cases of hoarseness, the influence of climate, occupation and habit are to be considered. Irritation from unaccustomed air, dust, vapor, excessive smoking or drinking, all may affect the voice. Hoarseness is present with many general diseases, such as tuberculosis, rheumatic condition, heart lesions and nephritis. The usual cause of hoarseness in these conditions is oedema from venous stasis.

Hoarseness is usually a clinical rather than a

pre-clinical sign of disease. However, hoarseness may be a very early sign of disease. A change in the voice is frequently the first noticeable symptom in tuberculosis, especially in pregnant women, in whom their condition is likely to light up a quiescent tuberculous lesion.

Hoarseness may be caused by nerve conditions due to post-diphtheritic paralysis, which is a rather common condition.

Hoarseness may be a sign of a partial paralysis of the laryngeal nerves as the result of growths on the neck, esophagus or mediastinum, or of goiter or a gumma or an aneurism of the aorta.

The voice may be affected by lesions of the central nervous system.

A general practitioner who is making a health examination must bear the voice in mind and investigate the causes of its abnormalities.

#### NOSE BLEED

Every case of nose bleed demands an investigation into its cause. Nose bleed may indicate a disturbance of the circulation, either cardiac failure or high blood pressure or arteriosclerosis. It may also be due to cirrhosis of the liver or nephritis or chronic alcoholism. Other conditions to be considered are plethora, scorbutus, purpura hemorrhagica, pernicious anemia and hemophilia.

Nose bleed in the aged, seemingly without cause, may be an indication of incipient arterio-

sclerosis, a fact with an important bearing in the treatment of aged patients.

Nose bleed in children may be caused by a foreign body or diphtheritic infection.

Nasal hemorrhage is the most common form of vicarious menstruation and may attend other forms of sexual irritation. It is also a common symptom in hysterical women.

#### CHRONIC SUPPURATIVE OTITIS MEDIA

A running ear is a potential source of danger and a physician making an examination will make careful note of the condition and urge its treatment. It is well known that it may lead to meningitis and abscesses of the brain, and also to general septicemia and pyemia. The liability that the inflammation may be tuberculous is also to be remembered. Bacterial examinations of ear discharges are always to be made, and, when possible, the responsibility of the case is to be shared with the aural surgeon.

In conclusion we wish to emphasize the importance of special symptoms referable to the nose, throat and ear in their relation to general diseases. It is also important for the general practitioner to remember that since the conditions are referred first to him, upon him rests the responsibility for serious results that may develop through his failure to recognize them early and to give intelligent advice regarding their treatment.

### SECOND DISTRICT BRANCH

The annual meeting of the Second District Branch of the Medical Society of the State of New York was held on the evening of January 9, 1925, in the Assembly Room of the Medical Society of Kings, 1313 Bedford Avenue, Brooklyn, with the President, Dr. Frank H. Lasher, in the chair, and sixty members present. The following officers were elected for two years, beginning at the close of the annual meeting of the State Society:

President, Dr. Joseph S. Thomas, Flushing; First Vice-President, Dr. Guy H. Turrell, Smithtown Branch; Second Vice-President, Dr. Charles A. Gordon, Brooklyn; Secretary-Treasurer, Dr. R. F. Seidensticker, Brooklyn.

Dr. Owen E. Jones, President of the Medical Society of the State of New York, spoke on the increasingly cordial relations between the State Medical Society and its constituent county societies. He recognized the original work that is being done by the Medical Society of the County of Kings, especially along the lines of the prosecution of illegal practitioners of medicine, the organization of extensive courses in post-graduate medical education, and the evolution of a practical scheme for periodic medical examinations that was

being copied throughout New York State and the entire nation.

Dr. John E. Jennings, President-elect of the Medical Society of the County of Kings, described the work of post-graduate medical education which is being conducted by the society. One feature of this work is a series of lectures on Friday afternoons at five o'clock, in the Assembly Room of the Medical Society of the County of Kings. These lectures have been exceedingly popular and valuable, and the Assembly Room, seating four hundred, has been crowded at every lecture. The series of 1923-1924 consisted of twenty-five lectures given in a form which was practical to the average general physician. The subjects of the first three lectures are typical of the whole series, and were as follows:

"The Surgical Abdomen," by Dr. Joseph A. Blake.

"The Signs of Incipient Tuberculosis," by Dr. H. A. Bray.

"The Treatment of Pneumonia," by Dr. Harlow Brooks.

These lectures have been collected and published in book form.

Another form of post-graduate education is an extensive series of clinical courses under the joint auspices of the Medical Society and the Medical College. The courses are given in the hospitals at times which are convenient to those who form the classes.

The scientific part of the program consisted of a symposium on the relation of focal infections, and general medicine, as follows:

"Heart and Kidney Disease," Dr. Luther F. Warren

"Gastro-Intestinal Disease," Dr. A. F. R. Andressen

"The Genito-Urinary Tract," Dr. N. P. Rathbun

"Ear, Nose and Throat," Dr. Claude G. Crane

"The Teeth," M. B. Parker, M.D., D.D.S.

The field of the Second District Branch is identical with that of the Associated Physicians of Long Island, which has a thousand members, holds three meetings annually, and publishes its own monthly Journal, The Long Island Medical Journal. There is a cordial spirit of friendliness between the two organizations, and the members of the Associated Physicians show entire loyalty to the Medical Society of the State of New York.

### CADUCEUS POST, AMERICAN LEGION

Caduceus Post, No. 818, American Legion, held its annual meeting and dinner on Wednesday evening, January 21, 1925, in the Yale Club, New York City. Eighty-eight members were present. All the former officers were re-elected as follows: Commander, Graeme M. Hammond, M.D.; First Vice-Commander, Jay D. Whitham, M.D.; Second Vice-Commander, Herbert L. Wheeler, M.D.; Third Vice-Commander, Col. F. F. Reynolds, Adjutant and Treasurer, Mr. Robert R. Gerstner.

The after-dinner speaking was opened by Col. Peter Traub, who commanded a brigade in France, and is now Commander of the 77th Division of the Organized Reserves. He spoke of the high value of the work of the Medical Department warfare, and the need that a considerable number of younger physicians should be commissioned. While it is the policy of the Government to reward those who saw service in the World War, yet that plan has filled the upper grades of service and left the lower positions unfilled. Col. Traub appealed to the members of the Post to join the Reserves and also to influence their friends to seek commissions in the Army.

Rear Admiral Bradley A. Fiske spoke of modern national feelings and aspirations which call for full preparedness as as the best insurance of a continuance of peace.

Col. Charles R. Reynolds, Commander of the Medical Field Service School of the U. S. Army at Carlisle, Pennsylvania, described the courses which were given at the School. This address was of special interest to the members of the Post, for at least seven of the members present had attended the summer course in 1923, and many more are now taking correspondence courses which are under the supervision of the officers of the School. A large

number of reserve officers throughout the State have also taken the courses.

The Carlisle School is housed in the buildings formerly used as the Indian School. The courses are designed to instruct medical men in their peculiar duties in the field. No attempt is made, for example, to teach a surgeon how to treat patients in a ward of a field hospital, but it does teach him how to erect a tent hospital, and how to transport it and its equipment. Other courses give instructions in the work of an ambulance company and the transportation of the sick and wounded. The school also teaches the establishment of first-aid stations in the battle line, and the treatment of the wounded and their transportation back to a field hospital. All this is done by means of an entire outfit of service equipment which requires several hundred men to handle.

Courses for officers of the Regular Army are given throughout the year, but a two weeks' course is given for officers of the Organized Reserves, and for the Medical Students organized in the Reserve Officers Training Camps. Once a week during the summer course a demonstration of battlefield work was given, in which soldiers marked with wounds were stationed in the fields five miles away from the Post along a hypothetical line of battle, and the students went out and established aid stations, found and treated the men, and transported them back to the Post, where a Field Hospital was in operation. The demonstration occupied the entire day, and those who participated in it got a vivid mental picture of the actual equipment in operation.

Caduceus Post is composed of medical men, many of whom held high positions in the World War. It is representative of New York City's best thought in medical preparedness for any possible outbreak of trouble with another nation.

# DEATHS

- ALLEN, ANDREW HARRISON, Watertown, Long Island College Hospital, 1879, Fellow American Medical Association, Member State Society Died December 4, 1924
- ALSEVER, WILLIAM DEWEY, Syracuse, Syracuse University, 1900, Fellow American Medical Association, American Climatological Association, Syracuse Academy of Medicine, Member State Society, Physician University Hospital Died December 23, 1924
- ARGUE, HENRY A., Corning, New York University, 1881, Fellow American Medical Association, Member State Society Died December 25, 1924
- GLOVER, JOHN J., Stockport, New York University, 1857, Member State Society Died January 1, 1925
- GRAVES, GEORGE, Herkimer, University of Buffalo, 1870, Member State Society, for many years Treasurer of the Medical Society of the County of Herkimer Died January 24, 1925
- GREEN, ARTHUR RANDOLPH, Mount Kisco, Cornell Medical College, 1903, Fellow American Medical Association, American Public Health Association, Member State Society, Attending Physician North Westchester Hospital Died January 17, 1925
- HARRISON, STEPHEN DECATUR Elmira, College of Physicians and Surgeons of New York, 1879, Fellow American Medical Association, Elmira Academy of Medicine, Member State Society, Alumni Association City Hospital, New York City Died November 21, 1924
- HUNTER, DWIGHT WILLIAMS, New York City, College of Physicians and Surgeons of New York, 1879, Fellow American Medical Association, American Ophthalmological Society, New York Ophthalmological Society, Member State Society Died December 22, 1924
- KENNEDY, JAMES CHARLES, Brooklyn, Bellevue Medical College, 1882, Fellow American Medical Association, Fellow American College of Surgeons, Member State Society, Brooklyn Pathological Society, Brooklyn Surgical Society, Visiting Surgeon St. Mary's and St. Catherine's Hospitals Died January 11, 1925
- LEGGETT, NOEL BLEECKER, New York City, College of Physicians and Surgeons of New York, 1904, Member State Society Died November 9, 1924
- LINDRIDGE, EDWIN F., Brooklyn, Bellevue Medical College, 1875, Member State Society Died January 12, 1925
- LOEWE, JACQUES Brooklyn, Long Island College Hospital, 1897, Fellow American Medical Association, Member State Society, Attending Physician Beth Moses Hospital Died January, 1925
- LOEWENTHAL, PHILIP, New York City, New York University, 1895, Fellow American Medical Association, Member State Society Died December 29, 1924
- McKAY, WILLIAM, New York City, Toronto University, 1878, Bellevue Medical College, 1887, Member State Society, Fellow New York Academy of Medicine Died January 7, 1925
- McMASTER, PORTER REYNOLDS, Greenwich, College of Physicians and Surgeons of New York, 1892, Fellow American Medical Association, Member State Society Died December 21, 1924
- MANGAN, DANIEL CLARENCE, Brooklyn, New York University, 1891, Fellow American Medical Association, Member State Society Died January 6, 1925
- MERRILL, GEORGE VAN RENSSELAER, Elmira, College of Physicians and Surgeons of New York, 1863, Member State Society, Elmira Academy of Medicine Died November, 1924
- NELLIS, WILLIAM JACOB, Albany, Albany Medical College, 1879, Fellow American Medical Association, Member State Society Died December 9, 1924
- ROGERS, BENJAMIN FRANKLIN, Buffalo, University of Buffalo, 1879, Fellow American Medical Association, Member State Society, Buffalo Academy of Medicine Died January 1, 1925
- SKINNER, CHARLES N., Port Jervis, New York University, 1892, Fellow American Medical Association, Fellow American College of Surgeons, Member State Society, Visiting Surgeon St. Francis Hospital Died December 5, 1924
- SLOAT, HORACE MARTIN, Brooklyn, Long Island College Hospital, 1887, Member State Society Died January 13, 1925
- TEPLITZ, ISIDOR, Brooklyn, University and Bellevue Medical College, 1906, Member State Society, Attending Obstetrician Bushwick Hospital Died January 8, 1925
- VEDIN, ALMA, New York City, Woman's Medical College New York Infirmary, 1899, Fellow American Medical Association, American Association of Anesthetists, New York Association of Anesthetists, Member State Society, Anesthetist New York Hospital, Consulting Anesthetist New York Infirmary for Women and Children. Died November 14, 1924
- WILKLOW, GEORGE F., Ellenville, Fellow American Medical Association, Member State Society, Surgeon Benedictine Hospital. Died January 11, 1925

# THE DAILY PRESS

Last week we commented on the reports of outbreaks of para-typhoid fever in patients who had eaten cream puffs from clean bakeries. The articles ascribed the outbreaks to contamination of the food by mice or rats that had one form of paratyphoid fever. The New York American for Sunday, January 11th, had a full page illustrated description of the detective work done by the epidemiologists of the Department of Health in discovering the method of infection and proving every step of the process. The description was clearly written and well adapted to instruct the people regarding the danger from mice and rats, and the methods by which they may infect food, even in apparently clean bakeries and stores. We are printing extracts from the article as an example of an excellent bit of popular medical educational writing done in a way that is both interesting and effective.

"The inspectors paired off and went to each house where the illness had appeared.

"The first thing that they found out was that the symptoms of all the patients were exactly the same. There was high fever, intestinal pains, alarming physical weakness and nervous collapse. Such symptoms might belong to several diseases—ptomaine poisoning or typhoid among them. While the doctors took blood and other specimens for tests, the inspectors went minutely over everything that the families had eaten during the past two or three days.

"And when these lists were compared it was found that there was only one thing of which each and every one of the fifty-eight sufferers had partaken.

"That one thing was cream puffs.

"It was reasonable to suppose, then, that it was the cream puffs which had poisoned each of them, and this supposition was strengthened when it was found that all the cream puffs had come from one bakery.

"By this time the doctors had diagnosed the illness. Everyone of the ailing fifty-eight had para-typhoid fever, which is a milder mannered cousin of typhoid itself.

"The last link of evidence against the cream puffs was forged when remnants of them under chemical analysis, proved to be infected with the para-typhoid bacilli. But how had they been poisoned? And why? Had some one deliberately and wickedly infected the pastries? Or, was there some unclean person who had handled the cream mixture which had filled the puffs?

"When the little army of inspectors, doctors, and chemists trooped into the bakery from which the pastry had come and told the proprietor what

they had discovered, he was both genuinely alarmed and distressed—quite naturally, for he saw his business at stake, and he was as anxious as any one to find out how on earth those cream puffs could have gotten filled with disease germs. So they all went over the place minutely. Every article of food was tested. No contamination was found in any. Every employe was examined for para-typhoid—and not one of them showed a trace. Furthermore, the bakery was immaculately clean to all appearances, and the methods of mixing, cooking and handling the various doughs and fillings were hygienically correct.

"All the human inhabitants of the bakery showed a clean bill of health—but how about other inhabitants? The first possible ones that occurred to the inspectors were rats and mice. Traps were set in the neighborhood and a number of both were captured. They were killed and their viscera examined. And, sure enough, there, in most of them, were thriving colonies of the para-typhoid germ.

"There still remained the main question, however, of how in a hygienically carried-on establishment the rats could have contaminated the cream that went into the puffs? It seemed as though the answer to this would be easy, and back to the bakery went the inspectors to question further the proprietor.

"And here they came up against a closed wall for not only were there no rats in the bakery, but there had not been any for two weeks before the outbreak of the poisoning. And the cream was made fresh every day."

After describing the process of the manufacture of the crust and of the filling, both of which were subject to a cooking heat which would kill the disease germs, the account continues.

"One of the inspectors ordered the pail with the filling in it placed exactly where the other had been before it had been taken back to the kitchen for the filling of the puffs and there he sat minute after minute trying to puzzle out how possibly the germs could have gotten into it.

"He saw that there were shelves high up around the basement but for the moment that conveyed no idea to him. Then, as he sat there, he heard a plaintive 'meow' and something brushed against his leg. He looked down. It was one of the three tabbies who had chased away the rats, making friends with him.

"Suddenly she jumped upon a bench and by gymnastics that only cats know leaped from it and scrambled up on one of the shelves.

"A little pinch of dust came floating down,

dislodged from the shelf by her advent. In it were a few heavier specks of debris.

"And as suddenly as the cat had leaped a great light dawned upon the waiting inspector. He reached up to the shelf and scraped away a little dust that had gathered on the surface. Within it were more of those little dark particles. He took a part of this and scooping out of the cream-filled container some of its substance he threw the dust into it and stirred it. He then took this mixture and another sample of the dust to the Health Board chemist.

"And lo, and behold, when both had been analyzed, within them were found thriving colonies of the para-typhoid germs."

"It was now perfectly clear how the rats had poisoned the cream puffs.

"But the case shows the necessity of bakeries and other establishments for food preparation being kept free from dust. It is not enough that floors and receptacles be kept scrupulously clean and that the handlers of the food be spick and span. Dust is one of the most dangerous carriers of germs, and there should be frequent cleaning of shelves and all places where dust could collect."

In all the article we found only one error. The account says:

"Now the rat is a carrier of many deadly germs which affect it not at all—just as the mosquito carries the malaria germ but never has malaria. Rats and mice act as hosts for the para-typhoid bacilli, but don't suffer from it. But when the rat-carried germ gets by some way or other into a human being, it proceeds to wake up and do its wicked work."

The fact is that rats and mice are often made sick by the para-typhoid germs, and that one form of rat poison that is sold to kill rats consists of living cultures of the germs which are deadly to rats. It is also true that those which survive the attack may be carriers of the germs. The use of the rat virus is dangerous to human beings, and its sale is forbidden by some health authorities.

---

The New York Times of December 3rd, tries to uphold the claims for the chlorine treatment.

Its issue of December 3rd says "Negative Evidence is Indecisive."

"A rather elaborate report was given out by the municipal authorities, and it was to the effect that in their two clinics somewhat prolonged trials had failed to find any virtue whatever in the gas as a therapeutic agent. Statements more or less like this came at the same time from the hospitals, or some of them, where like tests had been made.

"That would have come near to being conclusive had it not been for the fact that the clinic first established—that at the Edgewood Arsenal in Maryland, are continuing with success to do exactly the work that here was called impossible, and in several other places, including the General Electric Company's plant in Schenectady, similar merits in the gas treatment have been demonstrated.

"The judgment, therefore, is confronted by both positive and negative evidence, and in all such cases the rule is that the positive evidence outweighs the negative. One almost is compelled to assume that the failures here were due, not to the worthlessness of the gas, but neglect to use it in strict accord with what has been proved the right way. The probability of this conclusion is the greater because the correct administration of the gas is not an easy or simple matter. When present in the air breathed in greater proportion than 0.15 milligram to the liter it is irritating and harmful, while in less than 0.12 it has no efficacy at all.

"Is Dr. Harris sure that in the tests that failed his apparatus worked within this narrow limit?"

The New York Times makes much ado over an alleged controversy between the Army physicians in Washington and the physicians of the New York City Department of Health over the chlorine treatment. The controversy seems to be over the fact that the Army doctors claim 70 per cent cures of colds, while the City Department succeeded in curing only 7 per cent of its patients.

Any physician knows that in some epidemics the patients recover in a few hours or days, and that in others, recovery takes weeks. The truth seems to be that the chlorine treatment does neither good nor harm.

- LORD LISTER** By SIR RICHMAN JOHN GODLEE, Bt K.C.V.O., M.S., F.R.C.S. Third Edition, Revised. Oxford University Press, American Branch, New York, 1924. Price \$7.00
- CLINICAL STUDIES IN EPILEPSY** composed of clinical notes on some epilepsies as bearing on the pathogenesis of idiopathic epilepsy. By DONALD FRASER, M.D., F.R.F.P. & S. (Glas.) William Wood & Co., New York, 1924. Price \$2.50
- SAFEGUARDING CHILDREN'S NERVES** A Handbook of Mental Hygiene. By JAMES J. WALSH, M.D., Ph.D., Sc.D., and JOHN A. FOOTE, M.D. Foreword by Honorable HERBERT HOOVER. J. B. Lippincott Co., Philadelphia and London. Price \$2.00
- A TEXTBOOK OF MATERIA MEDICA FOR NURSES** By A. L. MUIRHEAD, M.D., and EDITH P. BRODIE, A.B., R.N. Second Edition. C. V. Mosby Co., St. Louis, 1924. Price \$2.00
- A TEXTBOOK OF PHYSIOLOGY** By H. E. ROAF, M.D., D.Sc., M.R.C.S., L.R.C.P. Illustrated. Longmans, Green & Co., New York, 1924. Price \$8.50 net
- THE CURE OF OBESITY** By Doctor JEAN FRUMUSAN, Translated from the French by ELAINE A. WOOD. William Wood & Co. New York, 1924. \$2.50
- AIDS TO SURGERY** By JOSEPH CUNNINGHAM, M.B., B.S., F.R.C.S., Eng., and CECIL A. JOLL, M.S., Lond., F.R.C.S. Eng. Fifth Edition. William Wood & Co., New York, 1924. Price \$1.50
- FACIAL SURGERY** By H. P. PICKERILL, C.B.E., M.D., M.S. Introduction by Sir W. ARBUTHNOT LANE, Bart., C.B., M.S. William Wood and Co., New York, 1924. Price \$6.50
- RHEUMATIC HEART DISEASE** By CAREY F. COOMBS, M.D., F.R.C.P., London. Introduction by F. J. POYN-TON, M.D., F.R.C.P. London. Numerous original plates and illustrations. William Wood and Co., N. Y., 1924. Price \$4.50
- PRACTICAL LECTURES** Delivered under the auspices of The Medical Society of the County of Kings Brooklyn N. Y., 1923-24 series. One hundred and thirty-two illustrations, three color plates. Paul B. Hoeber, Inc., New York, 1925. Price \$5.50

# BOOK REVIEWS

**EMERGENCY OPERATIONS FOR GENERAL PRACTITIONERS ON LAND AND SEA, AN ILLUSTRATED MANUAL OF PROCEDURE AND TECHNIQUE.** By H. C. ORRIN, O.B.E., F.R.C.S., Ed., Surgeon, Ministry of Pensions Orthopedic Hospital, Newcastle-on-Tyne, late Civil Surgeon to the Third London General Hospital. William Wood and Company, New York, 1924. Price, \$2.75

This book is written for general practitioners, recent graduates, and ships' doctors, who may be suddenly confronted with situations in which they may find it difficult to extricate themselves unless some knowledge of just how to meet the emergencies is at hand. The book contains sixteen chapters in which are described the urgent major and minor operations of surgery. There is no discussion of diagnosis or alternative methods of treatment. The topics covered are anaesthetics, technique, operations upon the abdomen including those for appendicitis, hemorrhage from gastric or duodenal ulcers, strangulated hernia, rupture and gunshot wounds of the intestines and intestinal obstruction. He sets forth the technique of trephining, and operations upon the ear and nose. He tells how to remove foreign bodies from the air passage and the food passage. He discusses the emergency treatment of wounds in general, compound fractures and severed tendons and nerves, as well as cellulitis and infections in tendon sheaths. Emergency operations receive their due share of attention. Another chapter is devoted to the arrest of hemorrhage and the treatment of shock. Of the emergency operations upon the chest, the author describes treatment of mammary abscess, the technique of paracentesis and empyema. Among the urgent conditions in the genito-urinary system which may require emergency surgery, he describes aspiration of the bladder, suprapubic cystotomy, and an operation for hydrocele. He describes ovariotomy, operations for ruptured tubal pregnancy and pyosalpinx.

While a little knowledge is a dangerous thing to have at one's disposal, a small manual of this kind is a great asset to those who may be called upon to meet the emergencies described herein. For doctors are frequently called upon to do that which they have not been trained to do and do not wish to do, but which from their inability to delegate to others, must be done by them. The performance of these operations often under unfavorable and unkindly circumstances has frequently given the patient a fighting chance.

R. H. F.

the volume presents special features for study. In the Dardanelles Campaign, organized evacuation of sick and wounded by sea, and the problems of sanitation on a very restricted and overcrowded area under hostile fire, were the all-important considerations. In Macedonia, the dominant feature was warfare in mountainous country or in river valleys and ravines, the hot-beds of malaria. These required the organization of special ambulance transport for sick and wounded over mountain tracks, and extensive measures for combating a disease that threatened to repeat, in the history of the campaign, the disaster of the Walcheren Expedition in 1809. In Mesopotamia, the effects of extremes of heat and cold, the organization of river and desert transport, the problems of disease prevention generally and a variety of administrative difficulties were prominent features. East Africa was typical of a campaign in a tropical and bush country with troops operating in columns over a vast area against an elusive and mobile enemy, and exposed to all kinds of tropical diseases. North Russia on the other hand, was of exceptional interest, as there the medical services had the unusual experience of working for a great part of the year in an Arctic region over trackless, snow-clad and ice-bound regions. All these campaigns, therefore, are deserving of study by the student of military medical history." In addition to the above campaigns, this volume presents a most complete description and set of illustrations of the various methods of transportation of wounded that has yet been published. In appendix C are given the citations of the awards to medical men of the Victoria Cross, the Albert Medal, the Distinguished Service Order and other awards for bravery.

The editor and his co-workers are to be commended for having so quickly and so efficiently and so thoroughly presented to the world, this complete presentation of the Medical History of the War. The lesson which should be learned from these volumes, especially the last one, is the real importance and necessity of the medical branch of the Army. Too frequently the other arms of the Service have belittled the medical service and ignored it until some great emergency has arisen, and then the blame has been placed on failure of the medical branch, when the failure has been because of lack of consideration in plans. All through this volume, G. H. Q. overlooked the medical service in general plans to the detriment of the wounded.

H. M. Moses

**HISTORY OF THE GREAT WAR BASED ON OFFICIAL DOCUMENTS—MEDICAL SERVICES GENERAL HISTORY Vol IV** By MAJOR-GENERAL SIR W. G. MACPHERSON, K.C.M.G., C.B., LL.D., and MAJOR T. J. MITCHELL, D.S.O. Octavo of 711 pages, illustrations, maps and charts. London, His Majesty's Stationery Office, Imperial House, Kingsway, W.C. 2, 1924. Cloth, 25 shillings net.

This fourth and final volume of the Medical Services of the British during the World War covers the records of the Army in various parts of the World. It includes the operations of the Gallipoli Peninsula, in Macedonia, in Mesopotamia and Northwest Persia, in East Africa, in the Aden Protectorate and in North Russia. The editor truly states in the preface "The history of the Medical Services in each of the campaigns recorded in

**DISEASES OF THE CHEST AND THE PRINCIPLES OF PHYSICAL DIAGNOSIS** By GEORGE W. NORRIS, M.D., and HENRY R. M. LANDIS, M.D. Third Edition, revised. Octavo, 907 pages, 433 illustrations. Phila. and London, W. B. Saunders Co., 1924. Cloth, \$9.50.

By universal acknowledgment, "Norris and Landis" has become a standard textbook in the field it covers. The issuing of a new edition is naturally looked upon by students of internal medicine with considerable interest. In this, the third edition, the highest expectations are realized. All that is basic is retained in its full and well rounded presentation, but much has been added in the light of more recent well founded research. The book stands forth today most complete, a model of its kind.

FOSTER MURRAY, M.D.

**THE PRINCIPLES AND TECHNIQUE OF ORAL SURGERY** By ADOLPH BERGER, D.D.S., Assistant Professor of Oral Surgery, School of Dental and Oral Surgery, Columbia University, 355 Engravings, from original drawings, radiographs and photographs Dental Items of Interest Publishing Co., Brooklyn, 1923

This book is a record of the author's "personal experience gathered from fifteen years of active clinic work and private practice." In a very concise and comprehensive manner he gives a complete, remarkably well-illustrated story of every phase of Oral Surgery in only 444 pages

Some illustrations depict so clearly and in sequence the operations that the text is almost superfluous. The chapters are short and almost independent, but do full justice to the topic under consideration, conveying to the reader the most modern ideas and methods on the subject

Great skill and simplicity are shown in his operations on the maxillary sinus with the least mutilation to the neighboring dental organs and post-operative complications that are often the result of the so-called classical operations on the maxillary sinus

With courage and authority based on practical clinical experience for many years he opposes the view of many, that are against the performance of operations on the maxillary sinus through the mouth. He also shows thorough knowledge of modern dentistry and uses sound reasoning by advising conservative methods in dealing with diseased dental organs

This book is a valuable contribution and aid to everyone doing Oral Surgery. With the exception of the last few chapters on Ankylosis and Neoplasms that belong to major surgery, one can easily follow the author in every procedure, due to the clearness of presentation and wonderful illustrations

VICTOR STOLL

**MIND AND MEDICINE** By THOMAS W. SALMON, M.D., Professor Psychiatry, Columbia University Columbia University Press, New York 1924

This is an address delivered at the opening session of the College of Physicians and Surgeons, Columbia University, September 26, 1923, by the distinguished psychiatrist, Professor Thomas W. Salmon.

The modern physician can no longer justify a cold, aloof attitude toward the patient with mental symptoms. Fear for example, may cause death just as surely as carcinoma, it may demoralize and disable just as inevitably as empyema. Fear is as much of an example of a medical fact as hemorrhage.

The physician of the future will be trained to deal with the *total reactions* of human beings—mental and physical and social

The general hospital of the future will have suitable wards for the mentally ill

The psychoneuroses (the well known "nervousness" of the laity) were long ignored by the profession because of the absence of demonstrable organic changes. Hence the jazz cults came to the rescue

We have known the names of the common forms of insanity less well than we have known those of rare tropical diseases

Popular medical compromises have been to deny the genuineness of mental phenomena or to transform them into uterine displacements, impacted molars and endocrine disorders

Suppose that Michelangelo had steadfastly ignored one of the principal pigments. That is just what we, claiming to practice an art, have stupidly been doing in medicine

A lot of good would result if those who are engrossed by the more physical of the biologic processes were to read this little book.

A. C. JACOBSON

**ALLGEMEINE UND EXPERIMENTELLE PATHOLOGIE, NACH VORLESUNGEN FÜR STUDIERENDE UND ARZTE, VON DR. HERMANN PFEIFFER**, o.o. Professor und Vorstand der Lehrkanzel für allgemeine und experimentelle Pathologie an der Universität Graz, Mit 50 Abbildungen im Text und 8 teils mehrfarbigen Tafeln Urban & Schwarzenberg, Berlin und Wien 1924

This work embodies the consideration of only certain, selected fields in the domain of pathologic physiology. These subjects are dealt with in great detail, and afford valuable and interesting study. It is always of exceptional interest to read the views of a master, especially when he attempts to explain the mechanism by means of which disturbance of structure and function is brought about. Of particular note are his chapters on inflammation, the disturbances of the circulation, metabolism and of the internal secretions. The book is well worth reading, and is a desirable candidate for membership in the pathologist's library

MAX LEDERER

**HANDBOOK OF MODERN TREATMENT AND MEDICAL FORMULARY** A condensed and comprehensive manual of practical formulas and general remedial measures Compiled by W. B. CAMPBELL, M.D. Seventh Revised Enlarged Edition by John C. Rommel, M.D., and C. E. Hoffman, Ph.M. F. A. Davis Co., Phila., 1924 Price \$5.00 net

This book, now in its seventh revision, is greatly enlarged and contains much new material. To those who are not familiar with the art of prescription writing, it offers an exceptional opportunity to become acquainted with the manner in which drugs are combined and their application to diseases, which are alphabetically arranged. The formulae, if not used as presented, suggest possible ideas that the prescriber may utilize in making his own prescriptions. The metric and apothecaries' systems are both given for convenience. Recent graduates will find it a great help in meeting the difficulties that occur when at a loss in knowing, when, how, and what to write for

F. S.

**DYSPEPSIA AND ITS SELF-TREATMENT** By JADU NATH GANGULI, B.A., M.B. Formerly Senior Scholar, Calcutta University M. B. Nath, Biswanath Printing Works, Benares City 1924

This is a small book for the laymen, written by an old Hindu practitioner, who himself was for many years a sufferer from "dyspepsia" and who cured himself by the methods he outlines. The descriptive matter reads like the pages of the old almanacs, with difference that the treatment of all the diseases described is based on various obsolete theories, combined with a mixture of auto-suggestion and Hindu philosophy. The book makes interesting reading for the physician, and probably in India, where it is published, fills a need among the laity.

A.

**INTERNATIONAL MEDICAL ANNUAL. A Year Book of Treatment and Practitioner's Index.** Forty-second year, 1924. Octavo of 536 pages with 54 plates and 99 illustrations. William Wood and Company, New York

This publication is an encyclopedia of medical and surgical facts and procedures. This year is the forty-second of this annual and the editors have incorporated in one volume a wonderful amount of information which is modern in both medicine and surgery. Beginning with 4 important advances are recorded in various diseases through the alphabet to a discussion on Yellow Fever. As a handy reference book of progress, by British practitioners chiefly, this volume will be useful as it is concise, modern and accurate.

## The Easy Mark

My night bell rang It was about two a.m. It awakened me out of a sound sleep Wrapping my bathrobe around me I descended the stairs to the front door A young girl about 15 or 16 years of age stood there.

Her salutation was "May I use your telephone, Doctor?" Before I could answer she had made her way to the phone which was attached to the wall near the staircase. She turned the crank and "central" finally answered To my surprise and astonishment she called out the number of one of my neighboring fellow practitioners For the longest while the operator tried to obtain an answer Finally the little girl said, "Don't answer Well, that is funny I tried his front door bell a short time ago and there was no answer either"

Brushing past me in the hall while I held the door open, she explained "My sister's little baby is awfully sick and Dr F is the family physician I could not get him to answer his front door bell, so thought that I would try his phone number I knew you would not mind Much obliged. Good night."

After ascending the stairs and about to return to bed my better half murmured "A night call. May I do anything for you?" After pondering a moment my reply was "I think I should like you to knock me on the head"

ROBERT E COUGHLIN, M D

## Man Worth 98 Cents

"Marked down to 98 cents" would be a queer and insulting tag to put on a man. Yet that is what a man amounts to, considered in terms of his chemical contents, writes "The Toronto Globe." The analysis has been made by some technical sharp, and this is the astounding report

The ingredients of man plus water are as follows  
 Fat enough for seven bars of soap  
 Iron enough for a medium sized nail  
 Sugar enough to fill a shaker  
 Lime enough to whitewash a chicken coop  
 Phosphorus enough to make twenty-two hundred match tips  
 Magnesium enough to make a dose of magnesia.  
 Potassium enough to explode a toy cannon  
 Sulphur enough to rid a dose of fleas  
 This whole collection is worth 98 cents and that when things are three times as high as they used to be—*Tribune*

## A Charming Thought

It was after dinner and the talk had turned to psychology This disturbing question had just been put "When does old age really begin?"

To establish a formula was proving rather difficult, when one lady, who did not look her years, found the following

"To me, old age is always fifteen years older than I am"—*Cyrano (Paris)*

"Of all the things that that specialist ordered you to give up, what do you miss the most?"  
 The twenty-five dollars he charged me"

## One Bathtub a Season Is Enough

"Rafael Sabatini says 'A \$25 stenographer today is better off than a seventeenth century queen' So she is The queen had more dresses but no bathtub The \$25 stenographer has a bathtub and uses it"—*Arthur Brisbane*

Uhuh! but we'd like to be present when the parent of a stenographer tried to reason with her along this line

"Look here, Pansy You can't have no more new clothes this season You've got to turn your money over to mommer and me so we can put in a new bathtub"

Rouge of two thousand five hundred years ago has been discovered near Odessa Were there never any good old times?—*Punch*

"The slow thinkers live longest," says a prominent psychologist Not if they cross the street.—*Detroit Free Press*

## A Rumor

There is no truth in the recently published rumor to the effect that chiropractors, if and when consigned to Sing Sing, are forced to break big stones up into little ones with their bare hands, kneading and thumping the stubborn quartz into dispassionate and unresisting gravel

They are permitted to use regular sledges, exactly like those furnished to their fellow inmates And a friend of ours who is in the hardware business, wholesale, says that all of the great penal institutions are placing large advance orders for 12 pound rock-crushing mallets—*Medical Pocket Quarterly*

## More Than Possible

Hi A young lady (librarian) tells me your friend Ima Dodo asked her today for a book by Shakespear called "Veins and Adenoids"—Mervin L Lane, *Sun*

## Job's Comforter

Sick Man I feel as though I've been through hell!  
 Friend (at bedside) Now, Bill, you musn't go crossin' yer bridges before you come ter them—*Bulletin (Sydney)*

## A Losing Combination

As the M D rose to depart he cautioned the negro

"For your chills you are to take a pill at seven o'clock, and if you shake again take the other pill at eleven o'clock."

"Oh, Lawd, doctah," wailed the ducky, "ah kin see mah finish!"

"What do you mean?"

"Whenebber ah shakes to sebben come lebber ah loses out ebbery time!"

## HOW CAN WE BEST TREAT PERNICIOUS ANEMIA? \*

By LOUIS M WARFIELD, A B, M.D

ANN ARBOR, MICH

IN 1849 Addison read his original paper before the South London Medical Society. He called the disease idiopathic anemia and laid stress upon the bad prognosis. It was not until twenty-three years later that Biermer published his cases. He gave to the disease the name it usually bears, pernicious anemia. The English call it Addison's anemia, the Germans call it Biermer's anemia. If it bears anyone's name it should be Addison's. Wm Hunter, (1) who maintains that sore mouth is always present, would call it glossitic anemia. He thinks if this term were in general use that more cases would be seen early and more cases could be cured. In regard to the use of the adjective "pernicious" he expresses himself as follows: "The name pernicious is false, misleading, hurtful, and harmful, it is mischievous, prejudicial, disadvantageous, disserviceable, it is unlucky, sinister, obnoxious, oppressive, burdensome, it is inauspicious, destructive, and venomous, it is bad, as bad can be, ill-contrived, ill-conditioned, grievous, deplorable, lamentable, and pitiable, it is wrong, shocking, hateful, detestable, and confounded, it is inadvisable, unprofitable, inexpedient, useless, unskillful, and hopeless." It is easy to see that he feels strongly on the subject.

In a discussion on Addison's anemia at Guy's Hospital A F Hurst (2) began his remarks with this sentence, "It is now generally agreed that Addison's anemia is caused by a hæmolytic toxin produced by some infection in the alimentary canal." It seems to me that that is too dogmatic a statement in view of the paucity of proof which can be brought forward to substantiate it. Wm Hunter since 1900 has held that oral sepsis plays a large part in the causation of the disease. However, his views are not accepted by the majority of those most competent to pass judgment. He groups the

anemias which most resemble each other into four classes (3)

(A) Addisonian anemia (seasonal, *glossitic*, hæmolytic, hyperplastic)

(B) "Septic anemia," Hunter 1900-3 (*non-glossitic*, non-hæmolytic, aplastic)

(C) Cancer of stomach (*non-glossitic*, non-hæmolytic, aplastic)

(D) Bothriocephalus latus anemia (*non-glossitic*, hæmolytic)

Addison's anemia, according to him, is a disease characterized by sore tongue (100% of 200 cases), absence of HCl in stomach contents, and associated with periodontitis, pyorrhea alveolaris in which streptococci are found. The oral sepsis may be a separate cause of anemia, so-called septic anemia, and complicates the picture of Addison's anemia. Removal of the teeth, every one, allows absorption to cease and patients recover up to a certain point. He feels that if more attention were paid to the symptom of sore tongue it would not be one and a half to two years before the patient was seen by someone who understood the disease. Even if one does not agree altogether with Hunter's ideas he has done a service in consistently insisting upon early diagnosis and clean mouths.

There is one clinical sign without which practically all are agreed the diagnosis of Addison's anemia cannot be made. That is absence of free HCl in the stomach contents, often an achylia gastrica. This is a point of great importance and cannot be too strongly emphasized (Levine and Ladd, and others). (4) Some insist that even if all the evidence points to Addison's anemia the presence or HCl renders the diagnosis extremely doubtful. Achlorhydria has been found several years before the development of anemia, in one instance 12 years (Hurst). Hurst (5) mentions congenital achlorhydria and speculates on its effect in rendering people more susceptible to poisons.

\*Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester April 23, 1924.

swallowed. He also says, "It seems to me that a full recognition of the fundamental part played by achlorhydria in the production of Addison's anemia will more than anything else lead to the realization that the disease is no more pernicious than any other form of secondary anemia."

A tendency seen in some of the more recent articles is to relegate into the background the examination of the blood. Hunter, for example, thinks that the combination of sore-mouth, achlorhydria, age over 40, the seasonal character (onset and relapses occurring in the months from July to September) slight fever, lemon-yellow color is sufficient for diagnosis. They are not always present by any means. Cases of undoubted Addison's anemia are seen with normal blood counts and the color index is not invariably 1 or 1 plus. The difference between 8 and 1 may well be due to a faulty instrument used in estimating the hemoglobin or to the variation in the human element in reading the instrument, so that too much reliance cannot be placed on the color index. When the other signs and symptoms are present the diagnosis is certain in spite of the blood count. This should not be interpreted to mean that the blood examination is of no particular value and therefore need not be made, it only shows how important the other signs are in the diagnosis.

Giffin and Bowler (6) in an analysis of 628 cases of pernicious anemia found other diseases present in 108. In 10 cases the diagnosis of gall-bladder disease was substantiated clinically. No one was operated. They say that removal of foci of infection may improve the patient's condition, but they have no evidence that this has any direct effect upon the disease. They conclude that "while other diseases may produce a blood picture typical of pernicious anemia, the clinical and remaining laboratory features are absent to such a degree that it is doubtful whether the complete pernicious anemia syndrome is ever seen as a result of other disease."

Rinker (7) urges a more intensive study of the so-called primary anemias for foci of infection. Should these foci prove to have a relationship to the anemia, the anemia would then be no longer primary. This is the goal for which all are striving. Idiopathic or primary anemia is a term which confesses on its face total ignorance of the cause of the anemia. This anemia must have a cause, when that is found it is no longer primary but secondary anemia. The answer to the question "How can we best treat pernicious anemia?" is found in the discovery of the cause of the anemia. Up to the present time the cause has escaped detection, although from time to time

a case here and there is, by intensive study, taken out of the category of pernicious primary and put into the class of secondary anemia.

I confess that I cannot agree with those who look for the cause in alimentary tract poisoning. That there is production of poison which apparently has selective action on the bone-marrow, especially the red cell-forming part, is credible, and experimentally certain toxins as abrin and ricin have been shown to produce changes in bone-marrow like those due to pernicious anemia, yet the fact that at post mortem the marrow is often red and hyperplastic before exhaustion sets in argues more for an increased destruction of red cells than for an under-production of red cells. It may well be that the hyperplasia is an aberrant hyperplasia, resulting from the tremendous effort on the part of the marrow in response to toxic stimuli, and that the cells so produced by a poisoned marrow are rendered more easily phagocytizable by the so-called reticuloendothelial system. The fact remains that hemolysis outruns production. Since it is the property of the phagocytes to take up cells no longer of any use or changed in some way chemically so that they are capable of being phagocytosed, it does not seem logical to predicate an increased power of phagocytosis. This, however, may be present. However, as the body is filled with such cells ready to seize upon particulate matter of various kinds, an especial toxic stimulus to this so-called system seems a superfluous hypothesis. Peabody (8) and his associates are now studying phagocytosis from a new angle, and have already found unusual phagocytosis in the bone-marrow, the site of red cell production. The phagocytic cells are large mononuclear elements similar to those found elsewhere in the body with the greatest concentration in the spleen.

The achlorhydria does not seem to me to be a sufficient factor in the production of the anemia. We see many cases with achlorhydria who do not have pernicious anemia. Also the achlorhydria may be present for years before the anemia supervenes. The foulest mouths I have ever seen have not had pernicious anemia. It comes hard for me to believe that the swallowing of streptococci into a stomach unprotected by free HCl in the absence of any intestinal ulceration can produce toxins sufficient to produce pernicious anemia. There is no proof of the change in intestinal flora when the feces of cases of pernicious anemia are examined. In an intact intestine when the movements are daily or oftener how can there be absorption sufficient to damage the bone-marrow? If the intestinal glands at autopsy showed evidences of infection, such as is found in tuberculosis, for example, one might

assume that bacteria passed through the intact intestinal mucous membrane as the tubercle bacillus is said to pass. But the glands do not show infection, they are hemolymph glands, as Warthin has shown. Chronic foci of infection at the roots of teeth, in sinuses around the face, in gall-bladder, appendix, etc., discharge poison directly into the blood stream. It is understandable how such foci may, every second of a person's life, be injuring bone-marrow until the time comes when the symptoms and signs of pernicious anemia appear. I am of the opinion that achlorhydria is not a cause of pernicious anemia, but a result of the cause which produces the whole disease. The neurological symptoms and the combined lesions of the cord are not produced by even profound anemia of secondary type except in rare cases. We are yet far from a knowledge of the cause or causes of this baffling disease, with its remarkable remissions and relapses which last for variable periods. Stockton (9) has reported a remission of twenty years. Frequent blood examinations showed no striking peculiarities but there was absence of free HCl in the stomach contents throughout all the years. The patient died of pernicious anemia. How are we to explain this? It is just this remarkable variability of the length of remissions of this disease which renders it almost impossible to evaluate any given method of treatment. The tendency to remission shown at times by cases apparently on the verge of death makes it natural to attribute the remission which sets in to some special method.

It is our habit to study our cases of pernicious anemia as intensively as possible. We call in all the specialist help in our search for possible foci of infection. We examine the stools and culture the duodenal contents. We have a complete gastro-intestinal examination made by the X-ray department. Absence of HCl in the stomach contents makes us feel that we are dealing with a true Addison's anemia, and we may not find any focus of infection. The presence of HCl only spurs us on to greater and more intensive search.

Let me cite an illustrative case.

CASE I, H. K.—White, male married American, taxi driver, 42 years of age.

Entered hospital 3-28-22 complaining of weakness, shortness of breath and occasional epigastric pain.

The family and personal history are not important.

The present illness began in the fall of 1920 about 1½ years preceding entrance to the hospital. At that time he noticed a gradually increasing weakness which incapacitated him for work. He considered that he was becoming

ing pale, and his friends told him he looked yellow. He also experienced occasional severe epigastric pain, brought on by exertion, and not related to meals. He was nauseated at such times but did not vomit. His physician gave him some medicine, and after about six months he apparently recovered and was able to resume work. He remained well until the winter of 1921, when he again became gradually weak and unable to work, and the attacks of pain recurred. Treatment at this time, similar to that given before, was ineffective. He became progressively worse up to the time of entrance to the hospital, at which time he was almost bedfast.

He had no soreness of the mouth, no sensations of numbness or tingling in the extremities. During the course of his illness he lost about 15 pounds in weight.

*Examination* at the time of entrance revealed extensive pyorrhea alveolaris, marked pallor together with a definite yellow color of the skin, and a palpable liver and spleen. Otherwise, there were no significant signs. There was no abdominal tenderness. The blood Wassermann was negative, as were the urine and stool examinations. Blood pressure was 110 systolic and 70 diastolic. The blood showed 20% hemoglobin, 1,000,000 red cells, and 3,000 white cells. The stained smear showed a relative lymphocytosis of 40%, together with great variation in the size and shape of the reds. No nucleated red cells were seen. The reticulated or young red cells constituted 2% of the total number. It was impossible to do a gastric analysis, because the patient could not swallow the tube, but the vomitus which was obtained every time an attempt was made to pass the tube showed complete absence of free hydrochloric acid and very little combined acid, without any bile. Gastro-intestinal X-ray revealed nothing except a slight hypermotility of the intestine.

*Clinical Course* During a prolonged stay in the hospital, interrupted by occasional visits home as his condition improved, the patient showed a very slight and occasional rise in temperature up to 100°. He was transfused repeatedly with 500 to 600 cc of whole blood at a time, and each time his weakness and shortness of breath improved temporarily, but only so long as the added blood remained in his circulation, which was about ten days. He had none of the attacks of epigastric pain while under observation. Finally, after a lapse of five months under intermittent hospital treatment, from which no permanent benefit resulted, the abdomen was surgically explored. A thickened gall-bladder containing many stones was found. This was evacuated and drained, complete removal not being at-

tempted because of the patient's poor general condition. Recovery from the operation was prompt, and two weeks later the patient stated that he felt better than he had at any time during the preceding two years. Within four weeks the hemoglobin had increased to 60%. In two months he stated that he considered himself a well man, and letters from him at intervals since that time have regularly confirmed this. A blood examination two months after operation showed 85% hemoglobin, 4,200,000 reds and 6,500 whites, with no significant abnormality in the stained smear.

Here was a case with no sore mouth but with oral sepsis and absence of free HCl. Except for the last finding Hunter would probably class this as septic anemia. He probably would have lost all his teeth by extraction. He had a palpable liver and spleen, lemon-yellow color, blood findings not incompatible with those of pernicious anemia. Several blood transfusions were of no great benefit. Finally, on suspicion that he might have chronic gall-bladder disease, the abdomen was explored. This, then, was not a case of idiopathic pernicious anemia in spite of the achlorhydria, but might well have passed for one and, in fact, for a while did pass for one. We have learned our lesson, however.

CASE II, H S—64 years old, retired railroad engineer. He was in the Out-Patient Department on July 5th, 1923, at which time he was complaining of burning in the epigastrium and was diagnosed chronic gall-bladder disease. This was confirmed by X-ray examination of the gastro-intestinal tract. He returned and entered the hospital November 8th, 1923, with the complaint of numbness and tingling in his legs, palpitation of the heart, and pallor, which began about the latter part of July.

*Examination* showed general arteriosclerosis, with some myocardial insufficiency and chronic gall-bladder disease, without splenic enlargement.

The hemoglobin, on entrance, was 30%, reds 980,000, whites, 3,500, with 61% of lymphocytes, some nucleated reds, poikilocytosis, anisocytosis, 5% reticulated reds, normal fragility. Stool negative.

In spite of all our pleadings with him he refused to be operated upon.

Another case had some rather unusual features and is cited here on account of the post mortem finding of hyperplastic bone-marrow.

CASE III, M S—55 years old, admitted February 1, 1921, complaining of aching pain across the abdomen especially on the left side. For past 30 years he has had attacks of pain in the right upper quadrant, with jaundice at

times. There were chronic constipation and dyspepsia.

The *present illness* began 6 months before admission, with distress in the upper left abdomen, bad taste in the mouth, eructations of gas. There were slight numbness and tingling in the hands and feet. The mouth was never sore.

*Examination*. The patient was jaundiced, spleen was large and tender. There was irregular fever with attacks of pain and tenderness over the spleen.

Blood. Hemoglobin, 30%, reds, 1,370,000, whites, 7,000, Polys, 82%, L L, 4%, S L, 10%, M, 4%, nucleated reds, anisocytosis, poikilocytosis. After transfusion of 350 cc of whole blood the hemoglobin was 33%, reds, 1,750,000, whites, 7,300. Later the white blood cells were 11,000.

The stools were negative. There is no note of HCl. Streptococci were grown from a duodenal culture.

Cholecystotomy was performed with removal of stones and drainage of the gall-bladder. The patient did not long survive the operation.

At autopsy there were found chronic septicopyemia, embolic infarcts in spleen and kidneys, and hyperplasia of bone-marrow.

In spite of the infection the leucocytes were only 7,000, but there was a relative polymorphonucleosis of 82%. This man had a pernicious anemia blood picture. It is the blood picture which most physicians rely upon to make a diagnosis of pernicious anemia. These three cases show how frail a reed this is upon which to hang a diagnosis.

Then, how can we best treat our cases? First and foremost, study them intensively. Do not pay so much attention to the blood picture. It is only one part of the picture and may be very misleading. I fear the term "pernicious" has so saturated the minds of the profession that when they find a typical blood picture they give up the fight. Since it is known that certain chronic focal infections can closely simulate the picture of primary pernicious anemia, all such should be intelligently cared for. I speak advisedly, for too often with insufficient evidence foci have been blindly attacked. If after the most painstaking study there is evidence pointing to some organ, as the gall bladder, then preliminary transfusions and later laparotomy are surely justifiable. In a disease such as Addison's anemia, when prognosis is usually so grave, I believe we are justified in accepting a gambler's chance provided that the patient is not harmed thereby. Last year we removed the gall-bladder from a woman who had all the symptoms and signs

of Addison's anemia. We found only a slightly thickened gall-bladder which revealed under the microscope mild chronic inflammatory changes. The patient rapidly recovered from the operation, for a while became much better, gaining weight and both hemoglobin and red cells. After six months a relapse started and inside of four months she died. There was no evidence that the cholecystectomy had helped or harmed her.

Shall we transfuse? I can find no reliable statistics which show that transfusions have ever cured a case. There is an impression abroad that while the remission is at times accelerated, the relapse is earlier and the eventual outcome is the same as if there had been no transfusions. This is my experience. Bloomfield, in an analysis of a group of cases relative to the value of transfusion as an emergency measure, found that there was no evidence that it was of value or that the immediate mortality was decreased by the procedure. Transfusion in his series of 58 cases neither increased the length of remission or the duration of life.

Some give arsenic in various ways. Kulcke (10), in a review of all cases in the City Hospital at Dresden, comes to the conclusion that we have not made much progress in treatment in the past ten years. He thinks the best drug is arsenic and the parenteral administration has no advantages over the oral. I cannot see that neoarsphenamin, cacodylate of sodium or other arsenical preparations given intravenously or subcutaneously have any advantage over Fowler's solution given by mouth.

Splenectomy has its advocates and seems on the whole a logical procedure. Bloomfield (11) did not find that splenectomy showed any improvement over other measures. The best results are claimed to follow when the spleen is removed when remission sets in. Giffin and Szlapka (12) summarize the results of splenectomy on fifty patients as follows:

- 1 This review concerns fifty patients with pernicious anemia for whom splenectomy was performed. All were operated on more than three years ago.

- 2 The operative mortality was 6 per cent.

- 3 Ten patients (21.3% of those who recovered from operation) have survived splenectomy three years or longer.

- 4 Five patients (10.6% of those who recovered from operation) have survived splenectomy more than four and one-half years, and are still living. The total length of history of these five patients averages almost six years.

- 5 It may be stated with reasonable accuracy that, in addition to the immediate remission which occurred constantly following splenec-

tomy, splenectomy prolonged life in at least 20% of our cases.

6 We cannot satisfy ourselves that any particular pre-operative characteristics of the disease are indicative of favorable results following splenectomy. However, in the type of case in which there is evidence of active hemolysis, the patient shows a more marked immediate improvement.

7 Splenectomy may be recommended in pernicious anemia when, in view of all the circumstances, personal as well as medical, the possibility of the prolongation of life appeals to the family and to the patient. Occasionally the operation may be performed in order to bring about an immediate remission. We may, therefore, look upon splenectomy as a method of treatment in certain cases bearing in mind that the results are only fair and that there is still a small percentage of operative mortality.

Krumbhaar (13) has published a statistical study of the results of splenectomy collected from the literature. He tabulates 208 cases of pernicious anemia upon whom splenectomy was performed with the following results: post-operative death (within 1 month) 35 cases, post-operative mortality 16.8 per cent, record of subsequent death, 79, unimproved, 26, improved, 144.

Krumbhaar thinks that the pendulum has swung too far against splenectomy. In certain cases of "relatively recent onset, with a fair blood picture, signs of an enlarged spleen and increased hemolysis, splenectomy is usually advisable."

With this opinion I find myself in agreement and I feel that all who give the matter careful consideration will also agree.

Walterhoefer and Schramm (14) have scraped the bone-marrow from one tibia and have reported improvement in the cases. Just how such a procedure could be of therapeutic use is difficult to understand. It is very doubtful if this will be taken up as a method of treatment. Iron, as Stieglitz has shown, is found in the kidney tubules of cases of pernicious anemia and interferes with kidney function. It has long been considered that iron was of no value in this anemia. Now it would appear that the administration of iron actually may do harm by interfering with normal kidney function. Iron, then, had better be withheld from cases of pernicious anemia.

In view of the constant absence of HCl in the stomach contents it seems logical to administer dilute HCl. This should be given in dram doses (4 cc) in a glass of water with essence of pepsin, lemon and a little sugar in order to make it more palatable. This should be sipped throughout the meal. This should

not be stopped during the remission, as the achlorhydria is permanent and atrophy of the gastric mucosa is a constant pathological finding. Passey (15), however, presented before the Guy's Hospital Society a section of stomach removed at operation from a case of Addison's anemia. He called attention to (1) the presence of oxyntic cells though in apparently smaller numbers than normal, (2) evidence of inflammation, the openings of the secreting ducts being choked with leucocytes, (3) very little atrophy. There had been no free HCl in the test meal. The section did not appear very different from one removed from a case of chronic appendicitis, in which for a time there was absence of free HCl, but later free HCl appeared in the test meal. This only goes to show that the achlorhydria in certain cases is probably functional and is not dependent upon the complete atrophy of the gastric mucosa. There was no note of the reason for the abdominal operation.

In conclusion, I would make an urgent plea for the more intensive study of cases with a blood picture quite similar to that of idiopathic primary anemia. Should there be any free HCl in the stomach contents after a test meal, it is more than probable (Levine and Ladd) that the case is not a primary but a secondary septic anemia. Some of the attention which has been lavished upon the teeth, tonsils and accessory nasal sinuses should be directed to the study of the chronic infections of the gall-bladder. The infection in that situation is not always readily demonstrable. If there be evidence, though slight, that the gall-

bladder is not normal, I feel that in view of the gravity of the anemia, it is justifiable to lay before the patient and his family the question of operation. In the hands of a competent surgeon and a skilled anesthetist the risk of operation is not great. I believe we are justified in advising operation under the circumstances. It is by weighing all the evidence carefully and proceeding boldly, yet honestly, that we can hope in the present state of our ignorance to rescue a further small number of victims.

### FACTORS INVOLVED IN THE ACIDITY OF THE STOOLS OF INFANTS\*

By ALAN BROWN, M.B. (Tor) and FREDERICK F. TISDALL, M.D. (Tor)

From the Wards and Nutritional Research Laboratories of the Hospital for Sick Children and the Department of Pediatrics, University of Toronto

THE number of investigations of the exact acidity, that is, the hydrogen ion concentration, of infants' stools, reported in the literature are comparatively few. When the possible importance is considered of the relation of the acidity of the stools to the general condition of the infant, the rate of growth, the presence of fermentative diarrhoea, parenteral infections, and many other conditions, it is rather surprising that so few determinations have been reported. The only results which the authors have been able to find have been recorded in the German literature.

#### MEANING OF THE TERM PH

A great deal of work has been done by investi-

gators who have taken a measured portion of the infant's stool and titrated this with an alkali to the point of neutrality. This, however, determines not only the amount of free acid present, but also a portion of the acid which has already combined with certain bases. At first glance it would appear that if the acid were combined with a base it would be neutral and thus not enter into this titration, but it must be remembered that all salts are not neutral in reaction. One example of this is acid sodium phosphate. It is thus obvious that these titrations have not the same significance or value as the determination of the exact degree of acidity present in the stool.

The question arises as to what constitutes the degree of acidity of a solution. The degree of acidity of a solution depends on one thing and

\* Read at the Annual Meeting of the Medical Society of the State of New York at Rochester April 23, 1924.  
Published in part in *American Journal of Diseases of Children*, April, 1924.

that is the number of free hydrogen ions present. When a substance such as ordinary salt is placed in solution it is present in two forms, first as molecular or undissociated NaCl, which is chemically inert, and secondly as dissociated (ionized) or chemically active sodium and chlorine ions. Similarly acids in solution are present in two forms, the molecular or inactive and the dissociated or active forms. All acids, however, on dissociation must give free hydrogen ions ( $H^+$ ) regardless of the type of acid. Some acids are stronger than others, which simply means that they are more completely dissociated or ionized than the others. Hydrochloric acid is an example of a strong acid as it is practically entirely dissociated into its hydrogen and chlorine ions. Acetic acid is a weak acid because it is only slightly dissociated, (about 2 per cent), by far the greater part being in the molecular or inactive form.

If the degree of acidity of a solution depends on the number of free hydrogen ions, then the acidity may be measured by determination of the amount of hydrogen ions present in the solution. This is exactly what is done when the acidity is measured. The concentration of the hydrogen ions, and consequently the degree of acidity, is expressed in terms of a fraction of a gram of hydrogen ions per litre of solution. Thus a solution may have an acidity of one-tenth of a gram of hydrogen ions per litre or one ten-millionth of a gram, or any other amount. It is obvious, however, that this is a very cumbersome method of expressing the acidity of a solution, so the logarithmic notation first suggested by Sorensen is used. Thus, a solution containing one-tenth of a gram of hydrogen ions per litre is expressed as  $10^{-1}$ , or  $\frac{1}{10^1}$ , one one-

hundredth of a gram as  $10^{-2}$ , or  $\frac{1}{10^2}$ , or one one-

thousandth of a gram as  $10^{-3}$ , or  $\frac{1}{10^3}$ , and so on.

Even this, however, is a little cumbersome, so the figures 1, 2, 3, etc., are used in place of  $10^{-1}$ ,  $10^{-2}$ ,  $10^{-3}$ , etc., preceded by the symbol pH. Consequently pH 1, pH 2, pH 3 as the case may be, simply mean a definite amount by weight of hydrogen ions per litre of solution.

A solution with a pH 1, (or one-tenth of a gram of hydrogen ions per litre) is strongly acid, a solution with an acidity of pH 7, (or one ten-millionth of a gram of hydrogen ions per litre) is neutral and if the concentration is less than one ten-millionth as expressed by pH 8, pH 9, pH 10, etc., it is alkaline. It is beyond the scope of this paper to enter into a discussion of the means by which the amount of hydrogen ions are directly determined, other than to state that this is accomplished by expensive electrometric apparatus. The authors, however, in the present investigation have utilized a simple and well known procedure

by means of which colorimetric determinations have been made with rapidity and accuracy. In 1915 Levy, Rowntree and Marriott<sup>(1)</sup> suggested the use of the Collodion sacs for the determination of the pH of blood. The blood was dropped into collodion sacs and dialyzed for five minutes. The dialysate was found to be free from proteins and coloring matter but contained the blood salts, and was well adapted for use with indicators. In 1920 Kramer and Greene<sup>(2)</sup> utilized collodion sacs for the colorimetric determination of the pH of milk and obtained results which were found to be quite accurate when checked by electrometric determinations. It is obvious that the same principle can be used for the determination of the acidity of stools. One of us (Tisdall) devised a method which was employed in this study, the technique of this method is described in detail in *American Jour Dis Children*, April, 1924.

#### OBSERVATIONS

During the past summer over 1,300 determinations were made of the pH of infants' stools. The object of the investigation was not to study the effect on the pH of the stools of carefully prepared variations in the diet, but rather to determine the acidity as a routine procedure over a considerable period of time. Although it was quite evident at the beginning of this work that a number of the results would be of little use, still it was hoped that valuable information might be obtained where possibly least expected. In the opinion of the authors the results obtained have justified the procedure.

With the exception of a few stools from newborn, breast-fed infants all the specimens were obtained from artificially fed babies. They varied in consistency and appearance from that of loose green diarrhoeal stools to that of hard brown constipated stools. It was soon found that the presence of mucus produced an alkaline reaction. As a result of this, many diarrhoeal stools which contained mucus gave an alkaline reaction when it was quite evident that the underlying condition was an increased acidity of the intestinal contents. (Chart I.) This is probably the explanation of some of the conflicting statements made by older writers that diarrhoeal stools, under fermentative conditions, may have an alkaline reaction. It was also found that the brown, formed, constipated stool was frequently not nearly so alkaline as the pasty stool, and in other cases it was observed that reactions as alkaline as pH 8.3 were obtained with stools of a fluid to semi-fluid consistency. This simply demonstrates that the firmness of a stool may give little indication of the degree of acidity present. Most of the stools with a reaction more acid than pH 6.6, with the exception of diarrhoeal watery stools, were of a curdy consistency and had an acid odor. Values were obtained from the stools of artificially fed

babies, which varied from pH 4.6 to slightly more alkaline than pH 8.3. As stools were rarely encountered with an alkalinity of more than pH 8.3 the standards were not extended beyond this value.

Chart I Case J F illustrating that the presence of mucus produces an alkaline reaction. On September 6th, the stool was brown, pasty, September 7th, yellow, pasty, September 8th, yellow, curdy, and September 10th, yellow, fluid with mucus.

Only a few determinations, twelve in number, were made of the acidity of stools from breast-fed infants. As practically no infants were admitted to the hospital during the past summer who received breast milk exclusively, specimens were obtained from the Burnside new-born clinic. All the infants were under two weeks of age. The pH was found to be singularly constant. It varied only from pH 4.7 to 5.1 in the twelve specimens examined.

In a general way it was found that the degree of acidity of the stools was largely dependent on the type of food used. The stools from normal breast-fed infants as mentioned above had an acidity of about pH 5.0. Infants fed on butter-soup<sup>(3)</sup> generally had stools with a pH of about 5.8 to 6.2, while the stools from infants fed on protein milk, cows' milk dilutions with added carbohydrate, or whole soured milk with added carbohydrates were generally more alkaline than pH 7.0. It has usually been considered that protein milk with its low sugar content would produce an alkaline stool, while a feeding with a high carbohydrate content would produce an acid stool. In this respect some very surprising results were obtained. In certain instances it was found that infants fed on protein milk or soured milk, had acid stools which remained acid until carbohydrates were added to the diet. (Charts II and III.) Also it was found that the most alkaline stools were obtained from infants fed on whole soured milk with a total carbohydrate content as

high as twenty per cent. No consistent difference was found in the acidity whether the carbohydrate was added in the form of corn syrup, dextrin, maltose or cane sugar. The values obtained with one baby (Baby W B) serve as an example.

Chart II Case G L, age 2 months, weight 8 lbs, illustrating that the addition of carbohydrate to protein milk may change the reaction of the stools from acid to alkaline. The diet on July 27th was protein milk (powdered preparation) 2/3 strength 30 ounces. On July 30th 2/3 ounce of casein was added, and on Aug 4th 1 ounce of corn syrup was added.

Chart III Case R N Age 12 months Weight 17 lbs illustrating that the addition of carbohydrate to soured milk may change the reaction of the stools from acid to alkaline. Until the afternoon of August 27 this infant was on 2% soured milk 40 ounces and 1 ounce of dextrin maltose. The stools which were yellowish green in color contained a lot of fat curds. They would not be characterized as good stools. On the afternoon of August 27th the feeding was changed to 4 per cent soured milk 25 ounces, and granulated sugar 3 1/2 ounces. By August 30th the stools were of a yellow-grey pasty appearance. It is to be noted that the total amount of fat given was practically unchanged.

This infant was studied over a period of three and a half months. The diet consisted of whole soured milk with added carbohydrate up to a total content of twelve per cent for the first two and a half months, then to just under twenty per cent for the following month. During this period the acidity of the stools was determined sixty-three times. Of these sixty-three determinations only four were more acid than pH 7.6. The values generally ranged from pH 7.6 to 8.3. The stools were large, brownish, grey and soapy and when the inner part was exposed had a greasy appearance.

The effect of the addition of calcium carbonate to the food was determined in a few instances. It was found in certain cases that the addition of fairly large quantities (23 gm per day) of the salt to buttersoup feeding made the stool more alkaline (Chart IV). On the other hand in diarrhoeal conditions it produced practically no change. Although not sufficient cases were studied to draw authoritative conclusions, still, it appears that while the addition of calcium carbonate to the food in normal cases makes the stool more alkaline, in diarrhoeal conditions it has little effect.

Chart IV—Case J D, illustrating the effect produced on the acidity of the stools by the addition of calcium carbonate to a diet containing a small amount of calcium salts. This infant was fed buttersoup 14 ounces, whole milk 7 ounces and 23 grams calcium carbonate. The calcium carbonate was omitted and then replaced with the above result.

Observations were made on the effect of parenteral infections in a large number of cases. In the majority of instances the acidity of the stools increased and their consistency changed from smooth, pasty, to slightly loose and curdy (Chart V). In other infants the presence of parenteral infections seemed to have no effect either on the pH of the stools or on their consistency (Chart VI). In one infant rather unusual results were

Chart V—Case R S, illustrating the change in the acidity of the stool in the presence of a parenteral infection.

Chart VI—Case W B, illustrating that in some cases the acidity of the stool is practically unaltered in the presence of a parenteral infection. The consistency of the stools in this case did not change during the infection.

obtained. This baby (Chart VII) developed a pyelitis and the stool, observed daily, showed the following changes: Aug 30th, brown, semi-formed, Aug 31st, loose, greyish, curdy, Sept 1st, brown fluid with mucus, Sept 2nd, very watery with a few green curds and mucus. Yet in this case the pH never became more acid than 7.1. It is probable that the early production of mucus more than neutralized the effects of any acids present. It is of interest to note that shortly after this, the infant showed evidences of a prolapse of the rectum, which condition may have been a factor in the early production of mucus. From the forego-

Chart VII Case K S This infant in the presence of a parenteral infection developed loose watery stools with a few green curds and mucus. The stools did not show the preliminary acid reaction before the presence of mucus was noted.

ing observations it appears that parenteral infections generally cause an increased acidity of the stool, although there are many exceptions to this rule.

The question arises whether the acidity of the stool has any connection with the rate of growth of the infant. The answer may be both in the negative and the affirmative. It is well known that infants gain well on foods which normally produce acid stools, such as breast milk, buttersoup and malt soup. It is also obvious that they may gain just as well on foods which normally

Chart VIII Case B J, illustrating the rapid change in the acidity of the stools with a change in the food. On August 2nd the food was changed from buttersoup to a whole cows' milk dilution with added carbohydrate.

produce alkaline stools such as whole milk dilutions or whole soured milk, with added carbohydrates. It was found, however, that if the acidity was greater than that which is normally found with the particular type of food given, the infant did not do well.

Some further observations made during the course of the present investigation are of interest. When the food was changed from buttersoup to either whole milk dilutions or whole soured milk, with added carbohydrates, the pH of the stool changed with surprising rapidity. If the change in the food was made at 2 o'clock in the afternoon, the stools obtained the following morning at 9 o'clock were of a different consistency and of a much more alkaline reaction. (Chart VIII)

Chart IX. Case M K. On August 22nd the food in this case was changed from 2 per cent soured milk 20 ounces and  $\frac{1}{2}$  ounce of corn syrup to 4 per cent soured milk 20 ounces and 3 ounces of dextrin maltose. A marked change in the acidity of the stool did not occur until August 30th, eight days later. No reason was found for this delayed action.

Chart X Case H S. His chart shows the wide daily variations in the acidity of the stool which was encountered only occasionally. No apparent cause was found for these variations.

Another point of interest observed was that in occasional cases when an infant was given a food which would normally produce an alkaline stool the reaction would be acid for some days, then for no apparent reason the stool would suddenly change in consistency and become alkaline (Chart IX). A third observation of interest was that in certain infants the acidity of the stools showed wide daily variations. No apparent cause for this was found (Chart X).

### DISCUSSION

It is now well recognized that of the three main organic constituents of infants' food, that is, the fats, the carbohydrates and the proteins, it is chiefly the carbohydrates that are concerned with the production of acid. This production of acid is the result of the fermentative action of micro-organisms which break down the carbohydrates into lactic, acetic, formic, butyric and succinic acids. Lactic acid is the acid that is produced in the largest quantities, although occasionally a considerable amount of acetic acid may be present. Only traces of the other acids are found (<sup>4</sup>).

Fats are normally broken down by some of the intestinal secretions into the higher fatty acids and glycerine. These higher fatty acids, however, are non-irritating, or at most only slightly so. It has not been conclusively demonstrated that bacteria can split fat or break down the non-irritating higher fatty acids into the irritating lower fatty acids (<sup>5</sup>). At the same time the presence of fat and the higher fatty acids may have a stimulating effect on the growth of bacteria and thus indirectly increase the acidity.

The proteins are affected by many micro-organisms and various products are found such as indol, skatol, certain amin bases and ammonia. From our standpoint we are chiefly interested in the ammonia production on account of its alkaline reaction. Certain acids may be formed in small quantities but their effect is greatly overbalanced by that of the ammonia produced. It is thus evident that bacterial action on proteins with the resultant liberation of ammonia tends to produce an alkaline reaction.

From the foregoing statements it would appear that the reaction of a stool depends largely on the ratio of the carbohydrates to the protein in the food. Although this is true, nevertheless there are a number of other factors which greatly influence the reaction of the faeces. These will be discussed briefly.

It is known that normally, bacterial growth in the intestinal canal is almost entirely limited to the lower part of the ileum and the large intestine. As the production of acid from carbohydrates is accomplished by the action of micro-organisms it is obvious that this production of acid must occur in the lower ileum and the large intestine, the

so-called zone of fermentation. If normally no fermentation occurs in the upper part of the small intestine and sugars can be absorbed by this part of the intestine it is clear that one of the important factors in the production of acid is not the amount of sugar in the food but the amount of sugar which reaches and remains in the zone of fermentation. This point has been strongly emphasized by Bessau (<sup>6</sup>). Freudenberg and Heller (<sup>7</sup>) have demonstrated most clearly that the rate of absorption of a sugar has a definite effect on the acidity of the stool. Utilizing the fact that caramel is poorly absorbed by the intestinal mucosa, (<sup>8</sup>) Freudenberg and Heller fed an infant a whole cows' milk dilution containing 80 gms of caramelized cane sugar. The caramelization was accomplished by heating the cane sugar in an open pan until it was of a dark brown color. The pH of the stool was found to vary from 4.7 to 5.0. The cane sugar was then added without being caramelized and the stool promptly became alkaline with a pH of 6.7 to 7.4. It is obvious, therefore, that the rate of absorption of the carbohydrate by the intestine is an important factor in the production of acid.

As the production of acid from carbohydrates is the result of bacterial action different bacteria may produce different degrees of acidity. That this is so has been clearly demonstrated. Some observers (<sup>9, 10, 11</sup>) have found that the colon bacillus will not produce an acidity greater than pH 5.0 and that when the acidity is greater than this (pH 4.6) the colon bacillus is killed. *Streptococcus lacticus* produces an acidity of pH 4.2 to 4.6 while the *bifidus* produces an acidity as great as pH 3.7 (<sup>12</sup>). It is well known that in alkaline stools the bacterial flora is largely gram negative while in acid stools the flora is preponderantly gram positive (*Bifidus*, *lacticus*, *acidophilus*, etc.). The question at once arises, is the acidity of the stools the result of an infection and subsequent growth of an acid producing organism, or is the presence of these organisms secondary to other factors? It would appear most reasonable to assume that acid stools are the result of an infection and the resultant preponderant growth of the acid producing gram positive organisms. This question has been investigated at some length by many bacteriological workers. Their results will not be discussed here. However, a series of experiments from the chemical standpoint have been reported by Scheer (<sup>13</sup>), which are most interesting. He inoculated various milk media with stools from infants fed on breast milk and also from infants fed on protein milk. In three days' time the acidity of the media had reached pH 3.7 regardless of the type of stool with which it had been inoculated. It is evident that acid producing organisms were present in both types of stools but that in the protein milk stool the conditions were not favorable for their

proliferation, with the resultant production of acid. It therefore seems probable that the acidity of the stool is not the result of an infection by any particular type of organism but rather the result of conditions which allow one or another definite type or organism to grow.

The reaction of the stool can be altered by the addition of certain inorganic substances to the diet. This has been demonstrated by Scheer and Muller<sup>(13)</sup> who added alkaline sodium phosphate to breast milk and changed the reaction of the stool from pH 5.0 to pH 7.1. In the present work, it has been shown that the addition of a large amount of calcium carbonate may change the reaction of the stool (Chart IV). The explanation of the change is that the acids present react with these bases and produce salts which have only a slight degree of acidity (Buffer influence).

As already mentioned the presence of proteins tends to produce an alkaline reaction on account of the production of ammonia by bacterial action. From the discussion so far it would appear that the reaction of the stool depends on the ratio of the amount of carbohydrate present in the zone of fermentation on one hand, to the amount of protein bases on the other hand. It has been shown that the type of carbohydrate may influence the acidity of the stool by being poorly absorbed in the upper part of the small intestine and thus reaching the zone of fermentation in fairly large quantities. Also if the condition of the cells in the intestinal wall is such that they absorb the carbohydrate poorly, regardless of the type of carbohydrate in the food, then the amount of sugar available for fermentation would be increased, with a resultant increase in the acidity of the stool. In the opinion of the authors this is probably one of the most important factors in the production of acid in the intestinal canal.

There are at least two other factors which may be of considerable importance in determining the acidity of the stools. The first is the amount of intestinal secretion, which may have a marked effect on account of its alkaline reaction. The second is that in many pathological conditions it is probable that the zone of fermentation extends further up the intestinal canal than is normally the case.

It has been shown by Scheer<sup>(12)</sup> that there is enough carbohydrate present in protein milk to allow the production of an acidity of pH 3.7 when inoculated with infants' stools. Consequently if protein milk is fed to an infant enough carbohydrate is being given, to produce an acidity of pH 3.7 if it is not absorbed before it reaches the zone of fermentation. It has been stated by Finkelstein<sup>(14)</sup> that at least three per cent carbohydrate, and frequently more than this amount, should be present in the food in order to enable the metabolism of the body to proceed in the normal man-

ner. Then if in an effort to correct an intestinal acidity an infant is fed protein milk with its low sugar and high protein and base content, for a sufficient period to allow the low sugar to interfere with the nutrition of the intestinal cells, it is possible for the sugar to reach the zone of fermentation with the resultant production of acid. The addition of sugar to the diet might then stimulate the intestinal cells, so that there would be an increased absorption of the sugar and a resultant decrease in the acidity of the stool. Also stimulation of the intestinal cells from the increased sugar content in the food might influence the amount of alkaline intestinal secretions and also the length of the zone of fermentation.

It is of interest to note the results obtained in the present investigation in the light of the above remarks. In Chart II we see that an infant fed on protein milk had stools with an acid reaction. The addition of sugar to the diet changed the reaction of the stool to the alkaline side of neutrality. A similar result is shown in Chart III. This infant was on a diet containing 6.5 per cent carbohydrate and the reaction of the stools was quite acid. The carbohydrate was increased to 18% and the stools promptly became more formed and had an alkaline reaction. Numerous other infants were fed whole soured milk with added carbohydrate up to a total content of 20 per cent and in the majority of cases the stools were smooth and pasty with a strong alkaline reaction. A possible explanation for this surprising result is that the high carbohydrate so stimulated the intestinal cells that the absorption of sugar occurred very rapidly and thus lessened the opportunity for fermentation. The possibility must also be considered that the stimulated intestinal cells diminished the extent of the zone of fermentation and also produced a larger quantity of alkaline secretions. A further explanation might be found in the work of Wolff<sup>(15)</sup> who showed that when the concentration of the sugar was greater than 10 per cent fermentation was hindered.

The production of an acid stool by a parenteral infection may be explained on the ground that the vitality of the intestinal cells is diminished by the infection. This results in a lessened absorption of carbohydrate and consequently an increase in the amount available for fermentation with the resultant production of acid. No doubt the zone of fermentation is also increased.

From the foregoing remarks it might be assumed that the authors are advocating the use of high sugar diets in combination with whole soured milk to combat diarrhoeal conditions. While it is beyond the scope of this paper to enter into any discussion of this aspect of the problem, the authors simply draw attention to the fact that in certain diarrhoeal conditions the use of a concen-

trated high carbohydrate food will produce constipated alkaline stools. Similar results have been reported by Davidsohn and Rosenstein<sup>(10)</sup>. In many other cases the use of this type of feeding will be followed by strongly acid watery stools and disastrous results.

### SUMMARY

- 1 In the present investigation over 1,300 determinations of the pH of infants' stools have been made.
- 2 The pH of stools from normal new-born, breast-fed infants was found to be singularly constant, varying from 4.7 to 5.1.
- 3 The acidity of stools from artificially fed infants was found to vary from pH 4.6 to somewhat more alkaline than pH 8.3.
- 4 An acidity as great as pH 4.6 was encountered in artificially fed infants only in severe diarrhoeal conditions. Infants fed on buttersoup generally had stools with an acidity of about pH 6.0. Infants fed on protein milk, cows' milk dilutions with added carbohydrates, and whole soured milk with added carbohydrates generally had stools more alkaline than pH 7.0.
- 5 Whole soured milk with added carbohydrates up to a total content of 20 per cent generally produced strongly alkaline stools.
- 6 No difference was consistently observed in the acidity of the stool whether the added carbohydrate was in the form of corn syrup, dextrin maltose or cane sugar. In the present investigation the effect produced by other sugars was not determined.
- 7 The degree of acidity of the stools was generally increased in the presence of parenteral infections.
- 8 Based on the present work and the work of others the factors which influence the acidity of the stools have been discussed. From the chemical standpoint the acidity apparently depends on the ratio, in the intestinal zone of fermentation, of the carbohydrate on one hand to the protein and base on the other. The amount of carbo-

hydrate in the zone of fermentation, apparently is influenced, by the extent of the zone of fermentation, by the type of carbohydrate and by the state of health of the intestinal cells.

The authors are indebted to Miss A. M. Courtney, B. A., Director of Nutritional Research Laboratories of this hospital, for her many suggestions in the carrying out of this work, and to Dr. L. M. Murray, of the Resident Staff, for the preparation of the charts.

## RELATIONSHIP OF THE COUNTY MEDICAL SOCIETY TO THE COMMUNITY\*

By SAMUEL J. KOPETZKY, M.D.

NEW YORK CITY

IT is a momentous occasion for any man to be called to the leadership of the affairs of his fellows. The deep sense of gratitude he feels for the honor bestowed on him begets an even greater consciousness of responsibility. For the incoming President of the Medical Society of the County of New York, this latter feeling is enhanced by the high standards set for him by his predecessors. To equal the accomplishments of the administrations ending with Dr. Eugene H. Pool's will be no easy task.

One year ago, when Dr. Pool entered upon the office he has brought to such a successful conclusion, he spoke to you about the future development of the practice of medicine, and the physician considered as an individual was his topic. I am going to talk to you of the relationship of physicians as an organized group to Society. From the days when the oath of Hippocrates formulated what were even then the

standards which governed the practice of healing, the physician as an individual has enjoyed a privileged place in public esteem. He has been respected for his skill, loved for his charities and trusted for the self-evident unselfishness of his purpose. He was not only the healer when sickness made his care a necessity, but he was friend and counsellor in many intimate matters not directly connected with the healing art. He won this enviable position in the family circle because the family recognized his expert knowledge in matters concerning health and the high personal character which made him an impartial and competent adviser.

It is a somewhat astonishing anomaly that medical organization, which, after all, but represents these same physicians banded together, has not received the same confidence. Whereas the advice of the individual doctor is accepted in a spirit of cooperation and good faith, the counsels of physicians as a group—that is, of organized medicine—are too often met with sus-

\* Inaugural Address read before the Medical Society of the County of New York at the New York Academy of Medicine on January 26, 1925.

picion and mistrust. This skepticism has its origin, in all probability, in a general cognizance of the spirit of self-interest which ordinarily motivates the association of those engaged in kindred pursuits. To dispel it, it is necessary that a true estimation of the purpose and responsibilities of the county medical society be made.

The county medical society does not partake of the nature of a trade union or an industrial guild. While it is always vigilant in the defense of its members against external aggression, it has never made its defenses public offenses. It parallels its care for its members by its ever present concern for the public welfare.

The scientific function of the County Society is well understood. It is generally realized that it is a forum for the exchange of scientific ideas, that medical theories are brought here for discussion and scientific standards here set. It is not so commonly known what the communal obligations of the County Medical Society are, and I propose to outline here the conception of the public duties of the Medical Society of the County of New York, which it shall be my endeavor to realize during the coming year. These duties are educational, they are political and they are inter-vocational, insofar as they affect the professions allied to medicine.

Of the many offices of the County Society, probably none are more important than those which fall within the broad classification of educational functions. Scientific healing has passed out of its infancy and childhood and is now adolescent. As with all adolescents, the untrained observer has difficulty in distinguishing the beautiful from the ungainly, the permanent from the ephemeral and the true from the false. It is the part of the County Society, which is medicine's responsible spokesman, to clear up these confusions and keep before the public those facts which tend to make a healthy community. New discoveries in medicine should be reported to the public by the medical organization. Supposed cures should not be allowed to be disseminated, distorted by ignorance and magnified by self-interest, through the avidity of a reporter for news or the greed for publicity of a quack. The Society should furnish the press, the radio and other publicity agencies with bona fide news, and they, on their side, should cooperate to the end that all medical items published shall be authentic and trustworthy. There is a very definite obligation on the part of those who control publicity channels in this regard. Experience has demonstrated that the competent and honest physician does not require advertising to attract patients. Almost invariably the doctor who resorts to this means of self-aggrandizement is the man who has neither the professional nor the personal qualities to succeed in the practice of

medicine otherwise. Similarly, the discoverer of a real medical cure does not rush into special feature writing to gain its acceptance. The tuberculosis theories and the cancer cures of innumerable faddists may furnish sensational reading, but they divert many invalids from the real road to health and exploit the scientific ignorance of the very people whom it is the duty of the press to enlighten. Whatever the latitude that the law allows, it is a moral responsibility of newspaper publishers, broadcasting stations and all others who have access to the public eye and ear to lend their agencies to educational programs for the betterment of community health, and to refuse to spread the pretensions of the advertising quack or the vagaries of self-deluded enthusiasts. To some extent this is already being done, as the very fact that we are able to broadcast this talk through the courtesy of Station WEAf illustrates.

Even more important than the circulation of knowledge along the lines of curative medicine, is the need for the authoritative instruction of the public in the field of prophylaxis, or prevention. Preventive medicine has made, and rightfully, a very strong appeal to the lay imagination, and it is the role of the County Society, as it should be of the publicity media already spoken of, to see that none but the proper seeds fall in the receptive soil of public interest. The Medical Society of the County of New York was one of the pioneer medical organizations to recognize this, and, in conformity with the oriental theory that it is easier and better to stay well than to get well, it has instituted extensive machinery to enable the doctor to perform, and the entire public to receive, a health examination periodically. It is our purpose to make the physician more alert to recognize pre-clinical signs of disease, and to educate the public not to wait until sick, but to look for advice, at regular intervals, on how to remain well. The task of the Society has been made easier by the fact that the community is alive to its share of the obligation in this connection, and much valuable aid is being given to our program by such lay agencies as the New York Tuberculosis Association, the Milbank Foundation and the Committee for Health Service Among Jews.

The educational duties of the County Medical Society embrace still another important item not generally included in this classification. This is the exposure of quackery, both within and without the medical profession. It is a deeply rooted belief on the part of many people that organized medicine opposes irregular medical practice for economic reasons. This observation is exceedingly superficial. Charlatanry does not menace the physician, nor does its presence lessen the number of patients physicians are called upon to treat. Its danger is for the sick and ailing. The victim of the quack eventually reaches the

physician, and when he does, it is usually with a condition which has arrived at the stage of chronicity and requires prolonged treatment for a cure,—if it can be cured at all. Inasmuch, however, as even the intelligent layman is rarely able to detect the falsity of the pseudo-scientific claims made by the various cults, the County Society must expose the fads and "isms" which arise to prey on disease, not by arbitrary denunciation, but by an analysis of the fallacies on which these systems rest. Where, as in physical culture and various dietary fads, there is some element of truth in the cult's theory, it should be defined and its limitations explained. While there are always certain types who have a native preference for charlatanry, many people would be saved from exploitation by quacks if they were made to realize the downright absurdities, frauds and half-truths on which these irregular systems rest.

When we come to the political ramifications of the County Society's activities, we find that they center chiefly about the enactment and enforcement of laws affecting the community health. There is no greater concern of the state than the preservation of the health of its people, and it is a primary obligation of our legislators, regardless of party affiliation, to do what they can to effect this. Where and to whom shall they more properly turn for advice upon measures affecting the practice of medicine and the correlated topics concerning public health than to the organized profession? The County Medical Society has no paid lobby. It does not engage in legislative trading of any kind. But it has, in its Committee on Legislation, a group of vigilant, far sighted doctors who analyze every measure introduced into the Legislature which has any bearing whatsoever upon the practice of healing. Through this Committee, the endorsement of the physicians of the County is given to those bills which preserve the skill and integrity of the medical profession, promote public health and defend the people against the depredations or chicanery. Similarly legislation designed to admit untrained and unqualified men to the care of the sick or to hamper the advancement of medical knowledge is opposed.

The attitude of organized medicine toward the requirements for a medical diploma exemplifies the spirit we bespeak for all legislation affecting the public health. Despite the costliness and duration of the medical course, physicians have consistently supported laws framed to increase their scientific equipment. The medical course is among the most arduous of all professions, and it is the doctors themselves, who, realizing the importance of adequate training, have made it so. Likewise, when a law was proposed at Albany last year to strengthen and enforce the Medical Practice Act, although it entailed a certain irksome and unpopular feature for the

profession, the majority of the organized physicians of the state were prepared to accept it for the general good. This is the spirit which should be carried by the Society into all its efforts to foster or deter legislation. Whether it is an enforcement law to be promoted or an anti-vivisection act which must be opposed because it threatens the very life of medical research, whether it is a measure for hospital construction or the consolidation of existing city institutions to be supported or a strike bill which must be fought to the last ditch lest it empower numberless ignorant and unprepared faddists to treat the sick, the County Society must bring to its intervention in legislative matters the purest scientific spirit of analysis, impartiality and vision.

Hand in hand with law enactment, law enforcement is a problem which must necessarily occupy much of the County Society's attention. The Medical Practice Act, while seemingly fool-proof, is in reality very laxly enforced, and it is only when an extremely sensational instance of the dangers of irregular practice comes to light—as with the Connecticut diploma mill exposure or the death from diphtheria of a child who was treated by chiropractic instead of the administration of anti-toxin—that there is a spasmodic flurry of enforcement. The Medical Society of the County of New York, which exacts the highest scientific standards from its members, has a right to expect the community to demand the prosecution of quacks and unlicensed practitioners of the different cults. Even one life is too dear a price to pay for failure to enforce the medical practice laws. It is the aim of the Medical Society of the County of New York to procure as stringent enforcement of the statutes governing the practice of medicine as the present state of the law permits.

The third broad classification of County Society obligations to which I have referred, comprises the relationship of organized medicine to the allied professions, such as pharmacy, dentistry and nursing. These groups work in such close co-relationship with medicine that anything which lowers the efficiency of their operations is bound to react upon our own efforts, for medicine is the parent trunk from which all other branches for health promotion spring. An instance of the aid that medicine can be to the associated professions may be found in the recent legislative activity against what we have termed the "bootleg" drug stores. Following the closure of the saloons, a number of bartenders transferred their activities to drug stores, which they purchased and ran as a shield for their bootlegging activities. Not only did they sell liquor in violation of the law, but what they sold was frequently an impure and adulterated product. The reputable pharmacists, alarmed at the aspect their profession was given, sought legislative

relief With the help of the medical organizations, this was obtained

With regard to nursing, a very difficult situation has arisen which it is essential that the County Society should attempt to solve The present educational requirements for nursing, which are constantly being intensified and increased, have evolved a type of nurse who, while very valuable in public health work, is becoming more and more unsuited to the bedside tasks which are the essential features of her profession Drawn from the better educated classes, the nurse of today is unwilling to perform the more menial tasks which are assigned to her In fact, when stationed in a home where there is sickness, she frequently requires service and attention which are an additional burden to a family already disrupted by illness Although, superficially, it might seem that an educated, highly trained woman would be better able to essay the nurse's role, in actual practice it is a fact that the best equipment for the nurse, outside of the simple technical and anatomical knowledge which must necessarily be part of her training, is a cheerful desire to serve, a tactful sympathy and the ability and willingness to carry out the doctor's orders implicitly Other attributes fade into insignificance beside these It is true that the intensively trained nurse has a place in public health work, in teaching and in administration, but for the usual clinical care she is wasted unless she possesses the rare quality of being willing to shed her light under a bushel An intermediate nurse, who could perform the usual bedside duties equally well, would have the further advantage of being less expensive and would thereby make nursing care available to a large proportion of our population to whom it is now denied

While on the subject of nurses, there is one more connection in which an obligation rests upon the County Society Several instances have come before us wherein supposedly reliable registries have sent out women who were, personally, totally unfit to assume the responsibilities

which devolve upon a nurse Cases like these, which occur due to the failure of the registries to investigate their applicants for positions, tend to discredit a profession which actually has an exceedingly high personal average We propose to work out an arrangement whereby the County Medical Society could exercise some supervision over the nursing registries analagous to its position in the matter of certified milk and commercial laboratories, so that the public may be spared the danger of irresponsible nurses, and the nursing profession the undeserved reflections which a reprobate few can cast upon the whole

In considering the numerous directions that County Society activities might so profitably take, the question naturally arises as to how these aims may be attained Much can be done, as in the past, through the regular machinery of the Society—through its administrative bodies, through its counsel, and through the *New York Medical Week*, its official organ If the County Society is really to carry through its program to advance the physical well-being of the community, however, co-operation with other organizations is needed The press, the radio, the cinema, all are agencies for public information which the Society can, and is willing to, supplement by its expert knowledge Much that comes from all of these media in the way of medical news is at present incorrect and misleading We offer them a source of dependable information, uncolored by cheap sensationalism or self interest The large, unofficial health organizations are desirable allies and we shall welcome them as such in our common interest

The ship of organized medicine is setting sail on a new year Its flag is service, its port community health We, whom you have chosen to direct its course are grateful for the confidence reposed in us and will endeavor to merit it If we can make the community realize our aims and the sincerity of our purpose, if we can reach common grounds of mutual respect and understanding, our period of service will not have been in vain

## THE VARICOSE DISEASE \*

By ROBERT F BARBER and FUAD I SHATARA

*From the department of surgery of the Long Island College Hospital*

BROOKLYN, N. Y.

IN this paper it is not the intention to enter into a detailed and fatiguing description of the varicose vein and its pathological sequelae such as phlebitis, hemorrhage, eczema, ulcers, etc Those points only will be taken up that seem to have a bearing on the object of this paper That object is an investigation into the

nature of varix Time will not permit of a consideration of the operative treatment

In the lower extremity varicosities occur primarily in the internal saphenous vein and its branches More rarely the external saphenous is the seat of the lesion The appearance of these dilated veins is too well known to require further description

\*Read at the Annual Meeting of The Medical Society of the State of New York, at Rochester, N. Y., April 23, 1924

The literature is replete with descriptions of varicosities of the communicating or perforating veins. At operation we have followed these veins to the deep fascia, split the fascia at the point of perforation, and have noted an immediate change to normal in the calibre of the vessel. We have never seen the dilatation extend deeper than the deep fascia.

As regards the condition of the deep veins, the venae comites, the femoral and their branches, there has been much discussion and no evidence. In view of what has been said of the condition of the perforating veins below the deep fascia when the surface veins are varicose, it seems reasonable to suppose that they are rarely if ever varicose. When by operative interference the blood has been shunted from the diseased superficial veins into new channels of which the deep veins are no small part, the latter have never failed to handle the stream adequately. At least this would seem to indicate that the deep veins were functioning normally.

The venous valves are bicuspid with their cavities directed towards the heart. Veins are enlarged just above the attachment of the cusps so that blood may readily flow behind the latter, force their free margins together, and so occlude the lumen. Valves do not occur in veins less than one millimeter in diameter and are also lacking in many of the larger trunks, such as the venae cavae and the pulmonary and portal veins. The number of valves in any vessel is subject to considerable variation. The number of valves seems to diminish with age. The adult average in the saphenous is eight to ten. Although the point is not always well covered, according to the literature, the valves of the perforating veins allow the blood to flow towards the deep veins only. Within the last year this statement has been questioned. From dissections done by one of us (Dr F I Shatara) at the Long Island College Hospital, the point was established that the valves are so placed that the blood flows from the deep to the superficial system in the perforating veins. This confirmed the work done by others. Our conception of the venous flow between the superficial systems and the deep systems must be reversed. The perforating veins act as a spillway for the deep veins and thus relieve the tension on the deep veins which results from muscular action. The valves are to prevent the back flow of blood. They are called upon to do this only when the muscles are in action. During muscular action the pressure on the venous wall results instantly in an increase in the local venous pressure. As the blood is being delivered at any point in a vein with a certain pressure, this increased local venous pressure may temporarily exceed the pressure being delivered. This will have the effect of not only spurting the blood onward but also backward. In normal veins the valves now come into play

and prevent this reflux. The reflux is not checked in varicose veins and normal circulation is impeded.

Except for these momentary spurts which are checked by valves in normal veins the flow of blood is always in one direction. The conception or better misconception of the flow of blood in varicose veins is almost identical in previous writings on the subject. A reading of any of the standard texts on surgery will give the impression that varicosities are due to the fact that the valves in the internal saphenous have become incompetent and the weight of the entire column of venous blood from the vena cava is placed on the terminal veins, which thus become stretched, elongated, thin walled and tortuous. That high central pressure causes incompetency of the valves. The valves being gone the veins distend, and finally the blood begins to flow in the wrong direction in the saphenous, a "vicious circle" being established.

Because of lack of valves they say that regurgitation is not checked, and the blood flows in the reversed direction. In a normal individual standing erect the blood flows from the toes toward the heart past open valves. The valves are not concerned with this onward flow, and if the valves were not there the flow would continue in the same direction. The "jinx" of the valves has been something that must needs be explained by these writers, and they all fall into the same errors. Enlarge the vein much or little the flow is still in the same direction. The rate may be altered but not the course of the stream. The blood does not flow forward because of the ever present valves. The onward flow is due to one thing only, the vis a tergo received from the capillaries.

If the blood current is reversed in varicose veins we have some other analogous problems to explain. In varicocele the veins become dilated and the valves useless. By the old reasoning the flow should be downward. What happens to the arterial and venous streams when they meet in the testicle. The blood supply is terminal and something in the nature of a trophic disaster should happen. It does not happen. The reason is that the hypothesis of reversed circulation is a fallacy.

It is now opportune to take up a critical consideration of the clinical tests that are used in varicose veins.

*The Trendelenburg Test.* With the patient in the horizontal position the lower extremity is elevated. After the internal saphenous vein has emptied digital compression is made over the saphenous opening. The patient then stands. The pressure is released. If there is an immediate filling of the internal saphenous by a column of blood dropping from above downward, the test is positive. A positive test means that the valves

are incompetent From points higher than the compressing finger the drop of the column of blood is almost instantaneous It is a dramatic test and a *sine qua non* for varicose veins But a dilated internal saphenous vein can be seen with the naked eye No bicuspid venous valve will work in a dilated vein The test is of little value because we know that the valves are useless the instant that we see the big veins

*The Filling Time Test* The technique is the same as for the Trendelenburg test, except that the digital compression is continued in the upright position and the time recorded until the internal saphenous vein is full Authorities arbitrarily state that if the filling time is thirty seconds or less it indicates that either the deep or the perforating veins are varicose If between thirty and sixty seconds then the varicosity is confined to the superficial veins In the former condition operation is supposed to be useless We have operated on patients with a filling time of twenty seconds with good result The filling time is a figure due to a personal equation and very variable It varies with the size number and length of the veins It gives us in seconds a record of the time that the arteries of the extremity take to fill up the visible venous structures The figures are too relative to be of value as a clinical test This statement presupposes that the arteries in a given case are normal

*The Manometer Constriction Test* In our early studies we devised this test as a means of measuring the so-called back pressure in varix The patient lies in the horizontal position The lower extremity is elevated and the saphenous is emptied The cuff of an arterial sphygmomanometer, preferably a Tycos, is applied either above or below the knee, and the pressure in the cuff raised to eighty millimeters of mercury This is sufficient to shut off the hydrostatic drop without shutting off the arterial circulation The patient then stands up and the pressure in the cuff is gradually released When the pressure in the cuff is just slightly lower than the hydrostatic pressure above the cuff the blood is seen to drop rapidly past the cuff and fill the veins below The test should be carried out rapidly before the veins fill from below The readings in forty-three patients averaged about forty millimeters of mercury above the knee and fifty below the knee This test led us at first to the erroneous conclusion that the hydrostatic pressure is greater than the *vis a tergo* This test has given us figures which simply represent the downward pressure of the column of blood, *i e*, the gravity or hydrostatic pressure As circulation is maintained this pressure cannot be as great as the *vis a tergo* As a balance against this hydrostatic pressure there is always an equivalent hydrostatic pressure in the arteries This latter pressure is incorporated in the *vis a tergo* The same figure

could be obtained by measuring the distance from the cuff to the auricle with a rule and multiplying by a constant factor The greater the distance the higher the figure obtained Therefore the test is of no special value

*The Blood Manometer Test* The readings obtained by this test greatly modified our previous views, and upon these readings many of the conclusions are based As far as we know, this method, though simple and with reasonable precautions safe, has never previously been tried out on human beings A glass tube three millimeters in diameter and one hundred and fifty centimeters long is connected with a piece of rubber tubing twenty-five centimeters long The other end of the rubber tube is slipped over the end of an 18 gauge Yale needle, four to six centimeters in length The needle and rubber tube are sterilized It is difficult to sterilize the glass tube on account of its length Therefore care must be taken to prevent any reflux of blood from the tube into the vein of the patient The cuff of a sphygmomanometer is applied just below the knee With the patient recumbent the skin of the leg is rendered sterile and the needle introduced into one of the superficial veins The blood rises in the tube with no pressure in the cuff The level is noted The pressure in the cuff is then raised and the effect on the column of blood is observed and recorded Now the patient stands erect and immediately all pressure is taken out of the cuff The column of blood rises The new level is noted Pressure is again applied to the cuff The column of blood rises The new level is noted The needle is removed and pressure and dressings applied Measurements are also taken from the point of puncture to the episternal notch Speed is essential to prevent clotting

Consider for a moment what the blood manometer test shows The test has undergone changes since it was first devised As our knowledge grew we increased the scope of the test Due to technical difficulties we do not attempt to get all possible readings on every case We do not wish it to be understood that we have reached the end by any means This is a preliminary report and is made with all possible reservations Under ideal conditions four readings are taken two in the horizontal position and two in the upright Taking the observations in their numerical order, an average reading would be as follows

No 1—17 centimeters

No 2—50 centimeters

No 3—90 centimeters

No 4—125 centimeters

The pressure in eight normal individuals and twelve patients was studied by this method The

patients all had marked varicosities. The pressure in varicose veins did not differ from the pressure in normal veins. Venous pressure is a wonderful variable, and is influenced by many factors. The first reading represents the venous pressure in the horizontal position, the physiologist's pressure. The second reading represents the potential venous pressure in the horizontal position. The third reading, the first in the upright position, always gives a figure which is proportionate to the distance to the auricle. At the latter point the blood flows over the dam, so to speak, and any tendency to a greater pressure is dissipated in the increased rate of flow of the blood. The fourth reading represents the potential venous pressure in the upright position. The energy to cause this latter pressure is always there but it is not shown. We check the energy which is being dissipated in rate of flow, dam up the stream in a way, and measure the potential drive.

As a result of this test we are in a position to lay aside certain views which were formerly held. Having done these tests on varicose and normal individuals, and having obtained pressure readings which are identical, we are in a position to state that reversed circulation does not occur. The capillaries deliver a *vis a tergo* which is capable of accounting for circulation in the vein. The calibre of the vein does not alter the drive.

The capillaries of the leg may be compared to the fulcrum of a balance. The weights in either pan are the columns of arterial and venous blood. Although the pans balance the weight and strain are constant on the fulcrum. The strain eventually tells, and in certain individuals the capillaries in the unprotected superficial tissues leak and give rise to ecchymoses and skin discolorations so commonly seen in varicose veins. The absence of valve action from dilatation has nothing to do with this strain, but the added strain on the vessels from back spurring during muscular action in dilated veins with functionless valves, adds insult to the injury already present. The legs are often pigmented with copper markings where no ulcer has been. This we interpret as the scar of chronic capillary leaks with permanent pigmentation resulting. Any somatic cell residing in such a locality is living in an unhealthy state. Slight skin abrasions may readily lead to infection, and an entirely different aspect be given to the picture by the introduction of this new element. The very bones may be involved. The disease may well be said to extend from core to circumference.

Consider for a moment two apparently healthy young individuals, with the same blood pressure, the same occupation, and the same general conditions of life. One develops varix and the other does not. There must be a congenital or inherent

weakness of the walls of the veins and their protecting structures of the one and not the other. In the early stage of the process of dilatation the valves work. The weakness lies not in the valve but the vessel wall. The deep veins are protected by the strong, deep fascia. This fascia acts on the veins in a manner similar to the action of the shoe of the automobile tire on the inner tube. The superficial veins have the skin alone to protect them against internal pressure, and the tendency to dilate. This is apparently not enough in some individuals and the veins begin to stretch both transversely and longitudinally. It is not till this actually happens that the valves go by the board, yet the disease is blamed on the valves. The valve is merely an incident in the story.

Thus it is held that the venous walls and their protecting structures are in a congenital or acquired condition that invites varix. It is to be understood, however, that the arterial blood pressure is normal or above normal. When the blood pressure is reduced locally the veins are much less liable to dilate. In one disease, thromboangitis obliterans, of which we have seen many examples, the local blood pressure is much reduced from arterial block. We have never seen varicose veins in this disease.

This work was begun to add to what had been done by others on the subject of varix. As a result to date it is believed that a new point of view must needs be taken on the nature of the lesion. Although the work is still incomplete the conclusions can already be drawn.

(1) That varicose veins are the pressure results on the least protected veins of the leg.

(2) That the blood flows in these veins in the same direction as always, *ie*, towards the heart.

(3) That the real pressure in the veins that does the damage is the result of *vis a tergo*, and which is of necessity a greater pressure than any hydrostatic pressure could be.

(4) That the teaching of vicious circle is a figment of the imagination and does not exist.

(5) That trophic changes in the legs are part of the penalty of man's upright position. The changes in the deep structures of the legs are probably all due to infection.

### Discussion

Dr FRED I SHATARA. In the five minutes allotted me to discuss this paper I can do no more than attempt to emphasize certain phases of the problem, which, because of lack of time Dr Barber found it impossible to emphasize. It is impossible to report the results of several years work in twenty

minutes When, several years ago, through the courtesy of Dr Barber, I was permitted to assist him in studying this disease, the problem appeared simple, and the ground well covered by previous investigators The more we studied the disease in the clinic, laboratory, operating and dissecting rooms, the more complex it became A start was made by accepting the teachings previously inculcated, but our findings compelled us to modify and abandon some of these teachings The studies have not been concluded, and future findings may modify present views With this reservation the following summary is presented

1 The internal saphenous vein, which is most frequently varicose, is an evolutionary defect Since man assumed the upright posture, the weight of the column of blood between the auricle and the thigh was superimposed upon the long, unsupported column of blood in the lower extremity, constantly subjected to the action of gravity With this structural defect as a pre-causes may start the disease Varicose veins may be a penalty the human being pays for standing upright on his hind legs, but those upon whom the penalty is most frequently imposed are those whose livelihood requires them to spend most of their time on their feet, and who can, therefore, least afford the penalty

2 The circulation in varicose veins is similar to that in normal veins as the vis a tergo, except when the heart is decompensated, is sufficient to overcome the obstacles in the way of the venous current There is no reversed circulation in these veins

3 Venous pressure, like arterial pressure is greatly variable, gravity playing an important role, there is, however, always a pressure gradient maintained with maximum pressure in the aorta and minimum pressure in the afferent vessels that empty into the right auricle

4 Venous valves have only one function, namely, to occlude the lumen when pressure is exerted on the vein wall during muscular contraction, and thus prevent backward regurgitation In varicose veins, the valves are insufficient, and during muscular contraction, the blood is forced not only onwards, but also backwards This backward regurgitation explains some of the pathological changes in varicose veins On the other hand this valvular insufficiency is only a link in the chain, and does not explain the whole pathological picture It must not be forgotten

that the internal saphenous vein is superficial, and therefore not subject to muscular compression Again sections removed from varicose veins have sometimes shown perfectly normal valves but a phlebosclerotic vein wall

5 To the valves in the perforating veins has been assigned a role which they do not play Upon this alleged role the filling time test is based The status of the deep veins, and therefore the operability of a given case is supposed to be determined by this test In dissections carried out at the Long Island College, these valves have been found to open both ways, and in several perforating veins, in individuals with normal veins, these valves are absent In dissections carried on for Dr Elmer D Twyman, by Dr Ranson of Northwestern University, and Dr Cowgill of Kansas University, the valves, contrary to common anatomical teachings were found to open towards the superficial system These findings were reported in the December, 1923, number of the Surgical Clinics of North America

6 In regard to the deep veins it is felt that while they may be the site at times of phlebitis with subsequent thrombosis they are unlike the superficial veins not subject to the varicose process They enjoy a strong fascial support, which is of greater moment than the action of flimsy valves It must not be forgotten that the superficial system of veins is, after all, a tributary of the deep system For both the internal and external saphenous veins ultimately join the femoral and popliteal veins respectively If varicosity, and subsequent downward regurgitation in the deep system were possible, then the blood delivered by the saphenous veins, would not return to the heart, but regurgitate downwards then back to the saphenous veins via the perforating veins, then back again to the deep system Thus a vicious circle which may result in gangrene of the lower extremity may be established Clinically, this condition has not been encountered Again, if varicosities of the deep veins exist, it would be reasonable to expect an accompanying varicosity of the external saphenous vein which empties into the popliteal Clinically, varicosity of the external saphenous is not frequent, has not been noted in cases with filling time of less than thirty seconds, and exists as a result of varicosity of the internal saphenous with which it often communicates

## THE ANNUAL MEETING

Monday, Tuesday, Wednesday and Thursday, May 11, 12, 13 and 14, at Syracuse, are only three months away and every member of the Medical Society of the State of New York should immediately mark his calendar and reserve those days for refreshing his medical knowledge, for rest after this hard winter, for recreation with men who speak his language, for renewal of old friendships, and for expression of his individual opinions upon organized medicine

Although the Committee on Arrangements received a severe blow through the untimely death of the Chairman, Dr W Dewey Albever, one of the truly great men of our profession, they have reorganized under the able and experienced leadership of Dr F H Flaherty of Syracuse, and are actively developing what promises to be one of the best State Meetings in our history

The Hotel Syracuse will be the headquarters for the Society and while the accommodations are ample, members will do well to make reservations there as early as possible

The Women's Medical Society of the State usually meets at the same time and place. The State Department of Health may also hold an official conference, and a large number of physicians and their families and friends are expected

Dr Andrew MacFarlane, of Albany, Chairman of the Committee on Scientific Work, announces the near completion of a program even more attractive than that given at the Rochester meeting last year, which was one of the best for a short meeting we have ever attended

And the Commercial Exhibitors are taking spaces that will provide most interesting features

Let us all co-operate in developing a great meeting in Syracuse.

## PROGRESS IN PERIODIC HEALTH EXAMINATIONS

The concept of periodic health examinations is undergoing a normal development and growth. It has not sprung fully formed from the brain of the medical profession, as the writings of some of its lay promoters would seem to indicate. Those who have made examinations conscientiously and scientifically have been embarrassed in judging what points to investigate. Even the nomenclature to describe the examinations has had to be developed, and the new word *pre-clinical* is coming into use to describe the mild signs which often precede the more serious symptoms of diseases.

It would seem to be a simple procedure to make a physical examination of an apparently healthy adult, and on its basis to prescribe a course of treatment, diet, or habit-forming which will indicate unerringly the pathway to a long and vigorous life. But the problem is not so simple.

Our practical ideas of what a periodic health examination should be are derived from previous experiences with large groups of persons. There are six principal groups in which periodic physical examinations have been made:

- 1 The United States Army
- 2 Those having life insurance policies
- 3 Workmen in industrial plants
- 4 Children in public schools
- 5 Tuberculosis patients
- 6 Infants and children in milk stations and clinics

Life insurance examinations have been practiced by nearly every physician, and these are the examinations which have given the average physician his idea of what to look for when making a modern periodic health examination. But an insurance examination takes account of only a few gross conditions, and the physician does not advise a patient regarding the meaning or the correction of the defects that are found. What an insurance company wants to know is how many persons out of a thousand of those examined will die during each year, or other given period. It is concerned only with the mass of those insured and not with individuals. It considers that every serious defect found may develop into disease and death, and so it fixes its insurance rates accordingly. It makes no attempt to correct defects. It is concerned with *clinical* signs, as distinguished from the *pre-clinical* signs which are sought in modern periodic health examinations.

Pediatricians in their milk stations and baby clinics have more nearly pointed the way for health examinations of adults. A pediatrician expects to see the babies regularly every week,

or month, to give advice regarding diet and habits of life, and to see that the children do not develop ill health to such a degree that they show clinical signs of disease. The yard-stick by which they measure the success of their work is the normal development of the babies.

A person making a modern periodic examination imitates the pediatrician in a baby clinic, and the yardstick by which he measures his success is the physical vigor of his patient.

Making a physical examination of a healthy adult, and giving advice regarding pre-clinical conditions require an immense amount of thought along lines which have not been intensively considered heretofore. The periodic health examination committee of the Medical Society of the County of New York has recognized the difficulty, and has invited sixteen specialists to present the subject of pre-clinical signs of disease, each in his own specialty. We have reported some of the addresses in this Journal and hope to report the rest. Some of the lecturers have told us about the embarrassment which they have felt because previously they had not given special thought to these examinations. These lectures have been wonderfully clear and simple, and may be readily followed by every general practitioner of medicine.

The lecturers have emphasized the importance of some modern conceptions which were unknown a few years ago, among them being focal infections, endocrines, metabolism, allergy, and immunity, together with the modern ideas of cancer and the interpretation of X-ray pictures.

The point which we wish to make right here is that it takes sixteen lectures to cover the subject of the simple pre-clinical signs of disease which any examiner is likely to meet. If the boiled-down abstracts of these lectures were printed, they would make a pamphlet of over twenty pages on the subject "How to make a periodic examination."

The evident lesson to be drawn from these facts is that a physician must prepare himself to make the examinations. Yet the preparation is not difficult or lengthy. The greatest value of the abstracts which we are printing is that they constitute an index or guide to the various conditions for which an examiner must look. The preparation of a standard index to periodic examinations is something new and is worthy to be classed as an excellent piece of research work.

The entire medical profession is indebted to the lecturers of the Medical Society of the County of New York for their conscientious work in preparing a standard guide for making a periodic health examination.

F O

## MEDICAL PRACTICE ACT

By this time you have had an opportunity to read the Medical Practice Act, which appeared in last week's issue of the Journal. As was stated, this bill has been prepared by the Department of Education and introduced into both houses. This need was commented on by the Governor in his annual message to the Legislature, and the endorser in both houses is a member of the majority party, so it is to be expected that the bill will receive the support it deserves. Several of the important revisions that have been made in the bill are the following:

First—It is provided that annual registration shall continue so long as the physician wishes to practice. The fee of \$2.00 remains the same and also the period of five years during which it shall be paid, is unchanged. The object in extending the period of registration is evident. Unless every physician in the County registers annually, it would be very difficult to determine at any particular time who are licensed to practice. The idea of the Department of Education at present is that annually they will submit to each physician in the State a list of the physicians residing in that County who are licensed to practice. Every physician receiving such list is asked to advise the Department of Education of the name and address of any person living in the same County who is practicing medicine, but whose name does not appear in the list. The Department of Education then—with its inspectors provided by the funds received from the registration fees—will investigate such report and collect evidence against the non-licensed practitioners. This evidence will be given to the District Attorney and if he, for any reason, prefers not to handle the matter, or is too much engaged

to undertake it immediately, he can refer it to a Deputy or the Attorney General's office, who will be detailed to bring early prosecution.

The second revision has to do with the penalties to be imposed upon physicians who fail to register. It will be noted in Section 170, article 6, that under no condition shall the penalties for non-registration affect the legality of the license of the physician to practice and such penalties may, for good cause shown, be remitted or compromised by the Board of Regents.

The third important revision will be noticed in Section 172, beginning "This article shall not be construed so as to prevent the following." These exceptions are now drawn so that it will be more difficult for persons employed in the various ways outlined to engage in the practice of medicine illegally, as numerous instances in the past have shown some of them inclined to do.

The fourth revision is in Section 173 under "Penalties." In Article 5 it will be seen that the monies accumulated from fees and penalties following in the enforcement of this act, shall be paid to the Regents of the University and shall be available for the administration and enforcement of this act only.

These revisions have definitely improved the bill, making it more workable, clarifying certain questions that were hazy in many minds last year, and assuring the physicians the protection they deserve from their State license, as well as guaranteeing to them that they shall not lose it except for such specific offenses as have always been considered sufficient and just cause for depriving a man of his privilege to practice medicine, or to be a member of the Medical Society.

J S L

## MEETINGS OF COUNTY MEDICAL SOCIETIES IN FEBRUARY

The executive officer has a list of the meetings of the sixty County Medical Societies of New York State and keeps it up to date, so far as possible. It is our desire to co-operate with him in every possible way and to give full publicity to the activities of the county societies. We are gratified with the response to our request for news from the County Societies, and we have used every item that has been sent to us, and in addition we have printed whole paragraphs of County Society news which have come to us through other channels. We are glad to publish the following list of County Society meetings to be held during February:

Albany, Second Tuesday	February 10
Bronx, Third Wednesday	February 18
Cayuga, Second Tuesday	February 10
Erie, Third Monday	February 16

Kings, Third Tuesday	February 17
Livingston, Second Tuesday	February 10
Montgomery, Second Tuesday	February 10
Nassau, Last Tuesday	February 24
New York, Fourth Monday	February 23
Onondaga, Second Tuesday	February 10
Orleans, First Tuesday	February 3
Queens, Last Tuesday	February 24
Rensselaer, Second Tuesday	February 10
Richmond, Second Wednesday	February 11
Schenectady, Second Tuesday	February 10
Tompkins, Third Tuesday	February 17
Ulster, First Tuesday	February 3

This list is as complete as the information on hand will permit. We hope that the list for March will be even more perfect.

Counsel, Medical Society of the State of New York

## DROP A NICOLL BILL IN THE LEGISLATIVE SLOT AND RECEIVE A DOCTOR'S DEGREE

A barber, after years of calling "next" and giving shaves, shampoos and haircuts, passes a few months in a chiropractic school and emerges as a doctor of chiropractic, he is licensed as such without examination, so that his lack of the elements of education are not known. He and two similarly endowed chiroso who have been either plumbers or turkish bath rubbers, are appointed by a judge having chiropractic proclivities to decide upon the sanity of a man charged with first degree murder. They solemnly proceed to examine chiropractically the defendant's spine and report to the court that the defendant has "misaligned and displaced vertebrae" from which they conclude that he is of unsound mind and should be sent to Mattewan Asylum for the criminal insane.

While this may sound like the scenario of a movie comedy, it may happen in actual life in this state if the Nicoll bill, designed to "regulate" chiropractic, is passed by the Legislature. Let us see how such an absurdity can be brought about by a legislative act. The Nicoll bill will, as shown in a previous issue of the Journal in this department, grant without examination, licenses to a thousand or more chiropractors, it will confer upon such untried and untested licensees the right to use the degree D.C., or Doctor of Chiropractic, it will also grant "the civil rights, privileges and immunities \* \* \* granted to all professional persons by the Civil Practice Act and the Judiciary Law." By Section 31 of the Judiciary Law, in criminal cases or habeas corpus proceedings, where the soundness of a person's mind is an issue, the court may have that question inquired into by three disinterested competent physicians. When the osteopaths were licensed under a similar exemption in 1907, without examination, it was not then suspected that they would be deemed physicians, but when the courts were called upon to construe their status, it was held that an osteopath so licensed was deemed a "regularly qualified physician." So, under the Nicoll bill there will

be added as "regularly qualified physicians" this large mushroom crop of chiropractors. So having been licensed without examination, having been given the title of doctor and having been thereby constituted regularly qualified physicians, it is quite clear that such chiropractors would claim the right to be appointed as alienists on such a commission under the Judiciary Law.

This is but one of the many absurdities that would result from the chiropractors' persistent efforts by legislative act to reap the fruits and benefits of study and education without spending the time or making the effort to obtain such education. You cannot make the ignorant, untrained and uneducated chiropractor a finished product of thorough education by legislative act which confers upon him the titles that heretofore have been gained only by an arduous and difficult course of academic education, specialized scientific instruction, and satisfying the regents tests. Whilst if the Nicoll bill should become law, such chiropractor might legally masquerade before the public by virtue of a legislative decree, as educated and trained and pretend to be something that he is not for his own personal pecuniary advantage, such a farcical procedure under the guise of a legislative method to "regulate" the practice of chiropractic cannot help but bring legislative procedure and practice into public disrepute.

From these considerations it can be readily seen that the Nicoll bill proposes to grant as a special privilege to a favored class, without reference to the qualifications of such class, practically all of the honor, titles, privileges and rewards that physicians enjoy only after meeting the highest mental, moral and scientific tests. Your legislators who will consider this bill will know nothing about these phases and patent evils of the bill unless their attention is called specifically to them. Every duly licensed physician in this state can effectively prevent the enactment of the chiropractic license farce by showing up this bill to his legislators.

## REMOVAL OF NASAL HUMP AND RESECTION OF DEVIATED SEPTUM

A case recently tried by your counsel involved an operation on the nose for the reduction of the hump and the straightening of a deflected septum by a surgeon practicing the specialty known as rhino-plastic surgery.

The patient's contention was that too great a part of the nasal bones had been cut away, thereby causing the bridge of the nose to sag, resulting in an unsightly nose. The plaintiff took the stand in his own behalf and was frequently ex-

anned, in the presence of the jury, by various doctors who testified in the case. His appearance was unfortunate and was such as might well have been calculated to inflame the sympathy of the jury in his favor.

The case was interesting from both the medical and legal point of view. Unquestionably the result as it was exhibited to the jury, was not good, and because it was so obvious, it was much more difficult to defend than are those bad results which are not so apparent to the lay eye. Where there is a bad result and the defendant doctor has either caused it or has in anywise participated in causing it, a serious problem is always presented, for the reason that it is difficult to restrain juries from expressing their sympathy for the patient in the form of punitive verdicts against the doctors, irrespective of whether they are responsible under the rules of law.

In this case three doctors testified in behalf of the plaintiff, but only one of them gave an opinion in response to a hypothetical question that the procedure followed by the defendant-doctor was not in accordance with proper and approved practice. Two doctors of unquestioned standing and of very wide reputation testified in behalf of the defendant doctor that the procedure followed by him was in all respects proper. All of the doctors on both sides of the case who had specialized in rhino-plastic surgery testified that in operations of this character the desired result cannot always be achieved in one operation, that it frequently requires several operations to ac-

complish that which is sought to be accomplished. The specialty of rhino-plastic surgery was compared to sculpture and the problems confronting the surgeon practicing this specialty were said to be analogous to those confronting the sculptor, who, as we all know, attains the perfect line and complete symmetry only as a result of long, painstaking and patient effort.

The question in these malpractice cases is not: Was there a bad result? The question is: Did the defendant doctor fail to follow proper and approved practice, and if this is so, did such failure lead to the bad result? That is to say, was it the competent producing cause of the result complained of?

In the case we are discussing the defendant doctor testified that he had told the patient before the first operation that it might take several operations in order to achieve complete success, and that after he was notified by his patient that there was a sagging of the nose he invited the patient to return for a further operation, but the patient declined or failed to come to him for that purpose.

Fortunately, in this case, the jury, while sympathizing with the plaintiff, unquestionably felt that the bad result was not the fault of the doctor sued, that is, that it had not been occasioned through any failure to follow proper and approved practice on his part. Accordingly a verdict was rendered against the patient and in favor of the doctor.

#### REMOVAL OF UVULA IN PERFORMANCE OF TONSILLECTOMY AND ADENECTOMY WITH CLAIMED RESULTANT IMPAIRMENT OF SPEECH

A child of about four years of age was referred by the family physician to a specialist in ear, nose and throat work, the physician having found that the adenoids and tonsils of the child were enlarged and diseased. Arrangements were made for the specialist to remove the adenoids and tonsils at the home of the child. The specialist accompanied by his assistant, were met at the child's home by the family physician, who administered the general anaesthesia to the child, and a tonsillectomy and adenectomy were performed by the specialist. There was no excessive bleeding and the child had come out of the anaesthesia and was in good condition at the time the specialist left. At the time of the operation it was found that the uvula was diseased and it was necessary to remove a part thereof. Nothing further was heard of this patient until some months later when the operating surgeon was served with a summons and complaint on behalf of the child against himself, it being charged that the operation performed by him was negligently and unskillfully done and that in the removal of the tonsils he had cut part of the flesh and organs in the child's throat so that the

child's speech became impaired and she was otherwise seriously injured. It seems that some other physician, subsequent to the operation, upon examining the child, informed the parents that the removal of part of the uvula was unnecessary and that the same would impair the speech of the child and prevent her from becoming a singer.

Upon a physical examination of the child it was found that the removal of the tonsils and adenoids was well done and that part of the uvula had also been removed. The child was found to be very fat and had a peculiar pasty color. She would not talk to the examining physician, so that it was not possible for him to judge of her character or speech. However, to the examining physician, the child appeared to be suffering from a mild form of faulty development due to imperfect function of the ductless glands which retards her progress in speech and changes the character of speech.

The plaintiff's attorneys having failed to bring the action on for trial, a motion was made in behalf of the doctor to dismiss the action for lack of prosecution, which motion was granted, dismissing the complaint in favor of the doctor.

## SUMMARY OF BILLS INTRODUCED IN LEGISLATURE

Senate Int No 11 (conc A Int 64)—A bill introduced in the Senate by Senator Seabury C Mastick of Westchester County, concurrent Assembly Int No 64, introduced in the Assembly by Assemblyman Herbert R Shonk of Westchester County, would amend sections 172, 181, Labor Law, by prohibiting employment of females over 16 years of age more than 48 hours a week in factories and mercantile establishments, except that for not exceeding eight weeks in any year, divided into not more than two periods, females may be employed not more than six days or 54 hours a week or nine hours a day, provided notice of such extension of working hours be sent to Industrial Commissioner at least three days before

Referred to Labor and Industries Committee of both houses

No action on bill as yet

## THE NARCOTIC BILL

Senate Int No 115 (conc A Int 215)—A bill introduced in the Senate by Senator Morton J Kennedy of New York, concurrent Assembly Int No 215, introduced in the Assembly by Assemblyman Morris Weinfeld of New York, would add new article 22, and amend section 4-b, Public Health Law, and repeals section 1746, Penal Law, relative to habit-forming drugs

Referred to Public Health Committee of both houses

No action on bill as yet

Senate Int No 116 (conc A Int. 216)—A bill introduced in the Senate by Senator Morton J Kennedy of New York, concurrent Assembly Int No 216, introduced in the Assembly by Assemblyman Morris Weinfeld of New York, would add new section 177, Insanity Law, requiring the licensing of private institutions for treatment of narcotic drug addiction

Referred to General Laws Committee of Senate, and to Judiciary Committee of Assembly

No action on bill as yet

STATE DEPARTMENT OF EDUCATION BILL  
TO AMEND THE MEDICAL PRACTICE  
ACT

Senate Int No 211 (conc A Int 307)—A bill introduced in the Senate by Senator John L. Karl of Queens County, concurrent Assembly Int No 307, introduced in the Assembly by Assemblyman Russell Dunmore of Oneida County, would amend sections 164, 169, 170, 173, 174 and repeal section 171, Public Health Law relative to practice of medicine, by providing among other things for the registration and licensing of physicians

Referred to Public Health Committees of both houses

No action on bill as yet

Senate Int No 228 (conc A Int 236)—A bill introduced in the Senate by Senator J Griswold Webb, Clinton Corners, N Y, concurrent Assembly Int No 236, introduced in the Assembly by Assemblyman T C Moore of Westchester County, would add new section 16-a, empowering State Charities Board among other things to visit and inspect all institutions in which children are received or cared for, and to establish rules therefor

Referred to General Laws Committee

No action on bill as yet

Senate Int No 263—A bill introduced in the Senate by Senator James A Higgins of Kings County, would amend section 81, Insanity Law, relative to qualifications of examiners in lunacy

Referred to General Laws Committee

No action on bill as yet

No 266

Int 263

IN SENATE,

January 23, 1925

Introduced by Mr Higgins—read twice and ordered printed, and when printed to be committed to the Committee on General Laws

## AN ACT\*

To amend the insanity law, in relation to qualifications of examiners in lunacy

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section eighty-one of chapter thirty-two of the laws of nineteen hundred and nine, entitled "An act in relation to the insane," constituting chapter twenty-seven of the consolidated laws, as last amended by chapter six hundred and seventy-three of the laws of nineteen hundred and twenty-one, is hereby amended to read as follows

§ 81 Medical examiners in lunacy, certificates of lunacy The certificate of lunacy must show that such person is insane and must be made by two reputable physicians who have filed with the commission a certified copy of the certificate of a judge of a court of record showing qualifications in accordance with law The qualifications of medical examiners in lunacy certified after date from which this act shall take effect shall be that he or she must be a reputable physician, graduate of an incorporated medical college, who has been in actual practice of his or her profession at least three years, and shall have at least two years actual experience in the care and treatment of the insane in an institution for the insane | graduates of an incorporated medical college who have been in the actual practice of their profession at least three years, and have filed with the commission a certified copy of the certificate of a judge of a court of record, showing such qualifications

in accordance with forms prescribed by the commission]

Such physicians shall jointly make a final examination of the person alleged to be insane within ten days next before and inclusive of the date of the granting of the order. The date of the certificate of lunacy shall be the date of such joint examination. Such certificate of lunacy shall be in the form prescribed by the commission, and shall contain the facts and circumstances upon which the judgment of the physicians is based and show that the condition of the person examined is such as to require care and treatment in an institution for the care, custody and treatment of the insane.

Neither of such physicians shall be a relative of the person applying for the order, or of the person alleged to be insane, or a manager, superintendent, proprietor, officer, stockholder, or have any pecuniary interest, directly or indirectly, or be an attending physician in the institution, to which it is proposed to commit such person.

§ 2 This act shall take effect immediately

\* Matter in *italics* is new matter in brackets [ ] is old law to be omitted

Senate Int No 266—A bill introduced in the Senate by Senator James S Truman of Owego, N Y, would amend subdivision 9, section 15, Workmen's Compensation Law, by providing for expenses for rehabilitating injured employees, not more than \$10 per week to be spent for maintenance.

Referred to Labor and Industry Committee

No action on bill, as yet

Senate Int No 278 (conc A Int 414)—A bill introduced in the Senate by Senator George L Thompson of Kings Park, N Y, concurrent Assembly Int No 414, introduced in the Assembly by Assemblyman Edwin W Wallace of Nassau County, would amend section 56, Criminal Code, by giving Special Sessions Courts jurisdiction in cases of willful violation to comply with lawful order of local health board or officer, where penalty does not exceed \$50 nor imprisonment six months.

Referred to Codes Committees in both houses

No action on bill, as yet.

Senate Int No 282 (conc A Int 413)—A bill introduced in the Senate by Senator George L Thompson of Kings Park, N Y, concurrent Assembly Int No 413, introduced in the Assembly by Assemblyman Edwin W Wallace of Nassau County, would amend section 21, Public Health Law, by empowering local health board to prescribe that a person willfully violating or omitting to comply with any lawful order or

regulation prescribed by it or a local health officer shall be guilty of a misdemeanor.

Referred to Public Health Committees of both houses

No action on bill, as yet

Senate Int No 283 (conc A Int 399)—A bill introduced in the Senate by Senator J Griswold Webb of Clinton Corners, N Y, concurrent Assembly Int No 399, introduced in the Assembly by Assemblyman Frank Lattin of Orleans County, would amend section 12, County Law, by authorizing county supervisors to provide expenses for public health nurses, who shall work under the public health committee of board, providing for appointment of advisory committee of citizens and relative to duties of nurses.

Referred to Internal Affairs Committees of both houses

No action on bill, as yet

No 287

Int 283

IN SENATE,

January 26, 1925

Introduced by Mr Webb—read twice and ordered printed, and when printed to be committed to the Committee on Internal Affairs of Towns, Counties and Public Highways.

#### AN ACT\*

To amend the county law, in relation to public health nurses

*The People of the State of New York represented in Senate and Assembly do enact as follows:*

Section 1 Subdivision forty-four of section twelve of chapter sixteen of the laws of nineteen hundred and nine, entitled 'An act in relation to counties, constituting chapter eleven of the consolidated laws,' such subdivision having been added by chapter one hundred and thirty of the laws of nineteen hundred and twenty-one, and amended by chapter sixty-seven of the laws of nineteen hundred and twenty-four, is hereby renumbered as subdivision forty-four-a, and amended to read as follows:

[44]-44-a The board of supervisors of any county, except a county constituting a general health district created under the public health law, shall have power to appoint and employ and provide for the expenses of such number of public health nurses as it may deem proper. Such nurses shall work under the direction of a committee of members of the board of supervisors to be known as the committee on public health. Any such public health nurse may be assigned by such committee to prenatal care and maternity protection, the reduction of infant mortality, the safeguarding of the health of children, the discovery and visitation of cases of tuberculosis, the prevention and control of communicable disease,

the care of the sick who may otherwise be unable to secure adequate care, the instruction of members of households in which there is a sick person, or to such other nursing duties as may seem appropriate to such committee. Except as hereinafter provided, the state commissioner of health or his authorized representatives shall have power to maintain general supervision over the work of such nurses.

With the approval of such committee the trustee or board of trustees of any common school district or the board of education of any union free school district within the county, may designate any such nurse as a school nurse to perform, in addition to her other duties, the duties of a school nurse for any school or schools under such respective trustee, board of trustees or board of education. Any such nurse so designated shall perform her duties as school nurse under the direction of the appropriate school authorities and under the provisions of the education law and under the regulations prescribed pursuant thereto.

The board of supervisors may appoint an advisory committee of citizens, of whom at least one shall be a physician and at least one a woman, to advise with and assist the hereinabove mentioned committee on public health in the organization and direction of the work of such public health nurses.

§ 2 This act shall take effect immediately.

\* Matter in italics is new matter in brackets [ ] is old law to be omitted

Senate Int No 302—A bill introduced in the Senate by Senator Ernest E. Cole of Bath, N. Y., would amend sections 571, 571-a, 572, 575, Education Law, relative to medical inspection and health service in public schools.

Referred to Public Education Committee

No action on bill, as yet

S Int 302

IN SENATE,

January 26, 1925

Introduced by Mr. Cole

AN ACT

To amend the education law, relative to medical inspection and health service in the public schools

The People of the State of New York represented in Senate and Assembly, do enact as follows:

Section 1 Section five hundred and seventy-one of chapter twenty-one of the laws of nineteen hundred and nine entitled "An act relating to education, constituting chapter sixteen of the consolidated laws," as amended by chapter one hundred and forty of the laws of nineteen hundred and ten, which section was added by chapter six hundred and twenty-seven of the laws of nineteen hundred and thirteen and amended by chapter one hundred and eighty-two of the laws

of nineteen hundred and sixteen, is hereby amended to read as follows:

§ 571 Employment of Medical Inspector

The physicians so employed shall be legally qualified to practice medicine in this state, and shall have [so practiced for a period of at least two years immediately prior to such employment] such further qualifications as may be prescribed by the regents of the university. Any such board or trustees may employ one or more school nurses, who shall be registered trained nurses and authorized to practice as such, and such health experts as may be required. Such nurses and health experts when so employed shall aid the medical inspector of the district and shall perform such duties for the benefit of the public schools as may be prescribed by [such inspector] such board of trustees under rules adopted by the regents of the university.

A medical inspector [or] school nurse or other health experts may be employed by the trustees or boards of education of two or more school districts, and the compensation of such inspector, school nurse or other health experts and the (Remainder same as old law)

§ 2 Section five hundred and seventy-one-a of such chapter, as added by chapter two hundred and sixty-five of the laws of nineteen hundred and twenty-four, is hereby amended to read as follows:

§ 571-a Apportionment of Public Money. In a city or a union free school district employing a superintendent of schools, or [two] one or more common school districts or union free school districts (Remainder same as old law)

§ 3 Sections five hundred and seventy-two and five hundred and seventy-five of such chapter, as added by chapter six hundred and twenty-seven of the laws of nineteen hundred and thirteen, are hereby amended to read as follows:

§ 572 Pupils to Furnish Health Certificates. A health certificate shall describe the condition of the pupil when the examination was made, which shall not be more than [thirty] fifteen days prior to the presentation of such certificate, and state whether such pupil is in a fit condition of bodily health to permit his or her attendance at the public schools. Such certificates shall be submitted within [thirty] fifteen days after his or her entrance in such schools to the principal. (Remainder same as old law)

§ 575 Existence of Contagious Diseases, Return After Illness. Whenever upon investigation a pupil in the public schools shows symptoms of [smallpox, scarlet fever, measles, chicken pox, tuberculosis, diphtheria, influenza, tonsillitis, whooping cough, mumps, scabies or trachoma]

any contagious or infectious disease reportable under the public health law, he shall

Such medical inspectors may make such examinations of teachers, janitors, or other school employees and school buildings and premises as in their opinion the protection of the health of the pupils and teachers may require, or as the rules of the regents of the university may direct

§ 4 This act shall take effect immediately indicates same as old law

---

Senate Int No 308 (conc A Int 386)—A bill introduced in the Senate by Senator James S Truman of Owego, N Y, would add new article 4-a, Workmen's Compensation Law, relative to fibroid phthisis (silicosis)

No 385  
IN SENATE

Int 380  
January 28, 1925

Introduced by Mr Farrell—read twice and ordered printed, and when printed to be committed to the Committee on Labor and Industry

AN ACT\*

To amend the workmen's compensation law, in relation to medical attendance and surgical treatment for an injured employee.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section thirteen of chapter eight hundred and sixteen of the laws of nineteen hundred and thirteen, entitled "An act in relation to assuring compensation for injuries or death of certain employees in the course of their employment and repealing certain sections of the labor law relating thereto, constituting chapter sixty-seven of the consolidated laws," as re-enacted by chapter forty-one of the laws of nineteen hundred and fourteen, and as last amended by chapter six hundred and fifteen of the laws of nineteen hundred and twenty-two, is hereby amended to read as follows

§ 13 Treatment and care of injured employees The employer shall promptly provide for an injured employee such medical, surgical [or] attendance or treatment, or both, by a physician selected by the employee, and such other attendance or treatment, nurse and hospital service, medicine, crutches and apparatus for such period as the nature of the injury or the process of recovery may require If the employer fail to provide the same, after request by the injured employee such injured employee may do so at the expense of the employer The employee shall not be entitled to recover any amount expended by him for such treatment or services unless he shall have requested the employer to furnish the same and the employer shall have refused or neglected to do so, or unless the nature of the injury required such treatment and services and the employer or his superintendent or foreman having knowledge of such injury shall have neglected to provide the same, nor shall any claim for medical or surgical treatment be valid and enforceable as against such employer, unless within twenty days following the first treatment, the physician giving such treatment, furnish to the employer and the industrial commissioner a report of such injury and treatment, on a form prescribed by the industrial commissioner All fees and other charges for such treatment and services shall be subject to regulation by the commissioner as provided in section twenty-four of this chapter, and shall be limited to such charges as prevail in the same community for similar treatment of injured persons of a like standard of living

§ 2 This act shall take effect immediately

\* Matter in italics is new matter in brackets [ ] is old law to be omitted.

## AN ACT

To amend the workmen's compensation law, in relation to compensation for occupational diseases

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section forty of chapter eight hundred and sixteen of the laws of nineteen hundred and thirteen, entitled "An act in relation to assuring compensation for injuries or death of certain employees in the course of their employment and repealing certain section of the labor law relating thereto, constituting chapter sixty-seven of the consolidated laws," as re-enacted by chapter forty-one of the laws of nineteen hundred and fourteen and amended by chapter six hundred and fifteen of the laws of nineteen hundred and twenty-two, is hereby amended to read as follows

§ 40 Time limit Neither the employee nor his dependents shall be entitled to compensation for disability or death resulting from disease unless the disease is due to the nature of his employment and contracted therein within the twelve months previous to the date of disablement, or, in case of apparent recovery from the disease by which the employee is enabled to resume such occupation, unless a relapse or aggravation of such disease was contracted, with resulting disablement, within twelve months from the date of such subsequent disablement, whether under one or more employers

§ 2 Section one hundred and fifteen of such chapter, as so re-enacted and as amended by chapter six hundred and fifteen of the laws of nineteen hundred and twenty-two, is hereby amended to read as follows

§ 115 Limitation of time No limitation of time provided in this chapter shall run as against any person who is mentally incompetent or a minor so long as he has no committee or guardian, nor shall any such limitation of time with respect to a claim for occupational disease begin to run until actual disablement therefrom, nor, in case the nature of the disease was not discovered until after such disablement, until the date of such discovery

§ 3 This act shall take effect immediately

EXPLANATION.—Matter in italics is new, matter in brackets [ ] is old law to be omitted

A Int No 182—A bill introduced in the Assembly by Assemblyman John Meegan of Erie County, would amend subdivision 6, section 15, Workmen's Compensation Law, by providing

compensation for disability shall not exceed \$30 per week, instead of \$20 as at present

Referred to Labor and Industries Committee

No action on bill as yet

#### AN ACT

To amend the workmen's compensation law, in relation to presumptions

*The People of the State of New York represented in Senate and Assembly, do enact as follows*

Section 1 Section twenty-one of chapter eight hundred and sixteen of the laws of nineteen hundred and thirteen, entitled "An act in relation to assuring compensation for injuries or death of certain employees in the course of their employment and repealing certain sections of the labor law relating thereto, constituting chapter sixty-seven of the consolidated laws," as re-enacted by chapter forty-one of the laws of nineteen hundred and fourteen, and as last amended by chapter five hundred and sixty-eight of the laws of nineteen hundred and twenty-three, is hereby amended to read as follows

§ 21 Presumptions In any proceeding for the enforcement of a claim for compensation under this chapter, it shall be presumed in the absence of substantial evidence to the contrary

1 That the claim comes within the provision of this chapter,

2 That an accidental injury, if proven, arose out of and in the course of the employment,

[2] 3 That sufficient notice thereof was given,

[3] 4 That the injury was not occasioned by the wilful intention of the injured employee to bring about the injury or death of himself or another

[4] 5 That the injury did not result solely from the intoxication of the injured employee while on duty[ ],

[5] 6 That the contents of verified medical and surgical reports introduced in evidence by claimants for compensation shall constitute prima facie evidence of fact as to the matter contained therein

§ 2 This act shall take effect immediately

EXPLANATION—Matter in italics is new matter in brackets [ ] is old law to be omitted

A Int No 201—A bill introduced in the Assembly by Assemblyman Frederick L Hackenburg of New York County, would amend section 3, Workmen's Compensation Law, by providing

for compensation for disabilities or death resulting from poisoning by benzine or by chlorine or iodine derivatives of petroleum products etc  
 Referred to Labor and Industries Committee

## AN ACT

To amend the workmen's compensation law, in relation to occupational diseases

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Subdivision two of section three of chapter eight hundred and sixteen of the laws of nineteen hundred and thirteen, entitled "An act in relation to assuring compensation for injuries or death of certain employees in the course of their employment, and repealing certain sections of the labor law relating thereto, constituting chapter sixty-seven of the consolidated laws," as re-enacted by chapter forty-one of the laws of nineteen hundred and fourteen, and last amended by chapter six hundred and fifteen of the laws of nineteen hundred and twenty-two, is hereby amended to read as follows

2 Occupational diseases Compensation shall be payable for disabilities sustained or death incurred by an employee resulting from the following occupational diseases

## Column 1

## Column 2

Description of diseases	Description of process
1 Anthrax	1 Handling of wool, hair, bristles, hides or skins
2 Lead poisoning or its sequelae	2 Any process involving the use of lead or its preparations or compounds
3 Zinc poisoning or its sequelae	3 Any process involving the use of zinc or its preparations or compounds or alloys
4 Mercury poisoning or its sequelae	4 Any process involving the use of mercury or its preparations or compounds
5 Phosphorus poisoning or its sequelae	5 Any process involving the use of phosphorus or its preparations or compounds
6 Arsenic poisoning or its sequelae	6 Any process involving the use of arsenic or its preparations or compounds

## Column 1

7 Poisoning by wood alcohol

8 Poisoning by benzene (benzol) or its homologues or analogues or by nitro-, [hydro- and] hydroxy- or amido-derivatives of benzene ([di-nitro-] benzol, anilin, and others)) or their homologues or analogues, including anilin, phenol, picric acid, trinitrotoluol, or its sequelae

9 Poisoning by carbon bisulphide or its sequelae

10 Poisoning by nitrous fumes or its sequelae

11 Poisoning by nickel carbonyl or its sequelae

12 [Dope poisoning (poisoning by tetrachlor - methane or any substance used as or in conjunction with a solvent for acetate of cellulose)] Poisoning by chlorine, bromine, or iodine derivatives of petroleum products, including carbon tetrachlorine, tetrachlorethane, methyl bromide or its sequelae

13 Poisoning by formaldehyde and its preparations

## Column 2

7 Any process involving the use of wood alcohol or any preparation containing wood alcohol

8 Any process involving the production or use of [a] benzene (benzol) or its homologues or analogues or of nitro-, [hydro-] hydroxy- or amido derivatives of benzene (benzol) or [its preparations or compounds] their homologues and analogues

9 Any process involving the use of carbon bisulphide or its preparations or compounds

10 Any process in which nitrous fumes are evolved

[1] 11 Any process in which nickel carbonyl gas is evolved

12 Any process involving the production or use of [any substance used as or in conjunction with a solvent for acetate of cellulose] chlorine, bromine, or iodine derivatives of petroleum products

13 Any process involving the use of formaldehyde and its preparations

- 14 Chrome ulceration or its sequelae

15 Epitheliomatous cancer or ulceration of the skin or of the corneal surface of the eye, due to tar, pitch, bituane, mineral oil or paraffin, or any compound, product or residue of any of these substances

16 Glanders

17 Compressed air illness or its sequelae

18 Miners' diseases, including only cellulitis, bursitis, ankylostomiasis, tenosynovitis and nystagmus

19 Cataract in glass workers
- Any process involving the use of chromic acid or bichromate or ammonium, potassium, or sodium, or their preparations

Handling or use of tar, pitch, bitumen, mineral oil, or paraffin or any compound, product or residue of any of these substances

Care or handling of any equine animal or the carcass of any such animal

Any process carried on in compressed air

Any process involving mining

Processes in the manufacture of glass involving exposure to the glare of molten glass

Section 1 Chapter eight hundred and sixteen of the laws of nineteen hundred and thirteen, entitled "An act in relation to assuring compensation for injuries or death of certain employees in the course of their employment, and repealing certain sections of the labor law relating thereto, constituting chapter sixty-seven of the consolidated laws," as re-enacted by chapter forty-one of the laws of nineteen hundred and fourteen, and last amended by chapter six hundred and fifteen of the laws of nineteen hundred and twenty-two, is hereby amended by adding to subsection two of section three a new subdivision, to be numbered twenty-two, to read as follows

- 22 Any process involving the use or handling of gasoline, benzine, naphtha, or other petroleum products
- 22 Poisoning by gasoline benzine, naphtha or other volatile petroleum products, or its sequelae

§ 2 This act shall take effect immediately

A Int No 203—A bill introduced in the Assembly by Assemblyman Joseph Reich of Kings County, would amend section 3, Workmen's Compensation Law, by providing for compensation in case of infection or inflammation of skin on contact surfaces, due to oils, cutting compound or lubricants or due to dust, liquids, fumes, gases or vapors

To amend section thirteen of the workmen's compensa-  
tion act

*The People of the State of New York, represented in  
Senate and Assembly, do enact as follows*

Section 1 Section thirteen of chapter six hun-  
dred fifteen of the laws of nineteen hundred  
and twenty-two, entitled "An act to amend the  
workmen's compensation law, generally," is here-  
by amended to read as follows

§ 13 Treatment and care of injured employees  
[The employee shall promptly provide for an]  
*An injured employee may, at the expense of the  
employer, employ or engage such medical, sur-  
gical or other attendance or treatment, nurse and  
hospital service, medicine, crutches and apparatus  
for such period as the nature of the injury or the  
process of recovery may require [If the em-  
ployer fail to provide the same, after request by  
the injured employee such injured employee may  
do so at the expense of the employer] The em-  
ployee shall [not] be entitled to recover any  
amount expended by him for such treatment or  
services [unless he shall have requested the em-  
ployer to furnish the same and the employer shall  
have refused or neglected to do so, or unless the  
nature of the injury required such treatment and  
services and the employer or his superintendent  
or foreman having knowledge of such injury  
shall have neglected to provide the same, nor  
shall] No [any] claim for medical or surgical  
treatment shall be valid and enforceable, as  
against such employer, unless within twenty days  
following the first treatment, the physician giving  
such treatment, furnish to the employer and the  
industrial commissioner a report of such injury  
and treatment, on a form prescribed by the in-  
dustrial commission All fees and other charges  
for such treatment and services shall be subject  
to regulation by the commissioner, as provided  
in section twenty-four of this chapter, and shall  
be limited to such charges as prevail in the same  
community for similar treatment of injured per-  
sons of a like standard of living*

§ 2 This act shall take effect immediately

what degree, if any, the general physical capacity of the employee or the applicant for employment is impaired by silicosis. The employer or the employee, as a matter of right, may demand and shall receive a re-examination and a further report from the Board of Examining Physicians. All medical examinations and reports shall be made in accordance with rules prescribed by the industrial board.

§ 67 Board of Examining Physicians. The industrial board shall name a board of examining physicians, to consist of three physicians, graduates of a recognized medical college and with at least five years actual practice, who shall specialize in the diagnosis and treatment of silicosis, and to whom shall be referred only cases involving controversies in relation to the medical aspects of claims arising under this article, unless otherwise herein provided. The industrial board shall fix the fees of members of the Board of Examining Physicians and shall prescribe their duties within the limitations of this section.

§ 68 Date of disablement. For the purposes of this article the date of disablement shall be such date as the industrial board may determine on the hearing on the claim.

§ 69 Compensation, how payable. Compensation shall be payable under this article either in a lump sum or in weekly payments as the industrial board shall determine, in accordance with the following schedule:

1 For an employee whose disability has been diagnosed as the ante-primary stage of silicosis, twenty-six weeks of compensation.

2 For an employee whose disability has been diagnosed as the primary stage of silicosis, fifty-two weeks compensation.

3 For an employee whose disability has been diagnosed as the secondary stage of silicosis, one hundred and four weeks compensation.

4 For an employee whose disability has been diagnosed as the final stage of silicosis, five hundred and twenty weeks compensation.

§ 70 Compensation, when not payable. No compensation shall be paid for the death or disablement of any employee who re-engages in any of the employments enumerated herein after he has been suspended, nor to any applicant for employment whose application has been refused but who engages in any of the employments enumerated herein.

Neither the employee nor his dependants shall be entitled to compensation for death or disability resulting from silicosis unless the disease is due to the nature of the employment and unless he shall have been employed continuously for five years in any of the employments enumerated in this article.

It being the policy and intent of this article to debar from employment in any of the employments herein, for the protection of their health and the conservation of their capacity for work,

any persons found to be physically unfit, an award of compensation hereunder shall be deemed to be final and no claim for compensation for death or disability from silicosis thereafter shall be valid and no further compensation shall be paid, provided, however, that nothing herein stated shall affect the rights of an employee to recover compensation in respect to an accidental injury or death arising out of and in the course of his employment in any other occupation than those enumerated in this article.

§ 71 Diseases which are accidents. Nothing in this article shall affect the rights of an employee to recover compensation in respect to a disease to which this article does not apply if the disease is an accidental personal injury within the meaning of subdivision seven of section two of this chapter.

§ 2 This act shall take effect January 1, 1926.

A Int No 399 (conc S Int 283)—See concurrent Senate Int No 283 for digest.

#### AN ACT

To amend the county law, in relation to public health nurses.

*The People of the State of New York, represented in Senate and Assembly do enact as follows:*

Section 1 Subdivision forty-four of section twelve of chapter sixteen of the laws of nineteen hundred and nine, entitled "An act in relation to counties, constituting chapter eleven of the consolidated laws," such subdivision having been added by chapter one hundred and thirty of the laws of nineteen hundred and twenty-one, and amended by chapter sixty-seven of the laws of nineteen hundred and twenty-four, is hereby renumbered as subdivision forty-four-a, and amended to read as follows:

[44] 44-a The board of supervisors of any county, except a county constituting a general health district created under the public health law, shall have power to appoint and employ and provide for the expenses of such number of public health nurses as it may deem proper. Such nurses shall work under the direction of a committee of members of the board of supervisors to be known as the committee on public health. Any such public health nurse may be assigned by such committee to prenatal care and maternity protection, the reduction of infant mortality, the safeguarding of the health of children, the discovery and visitation of cases of tuberculosis, the prevention and control of communicable disease, the care of the sick who may otherwise be unable to secure adequate care, the instruction of members of households in which there is a sick per-

§ 60 Definitions Whenever used in this article

1 "Fibroid phthisis" means an inelastic fibrous condition of the lung tissue caused by the inhalation of particles of free crystalline silica, which shall be referred to as "silicosis"

2 "Ante-primary stage" means that physical signs of damage to the lungs, short of definite physical signs of silicosis, have become evident and that such damage has supervened during and in consequence of employment in any of the employments enumerated herein

3 "Primary stage" means that definite and specific physical signs of silicosis are or have been present and that capacity for work is or has been impaired by that disease in consequence of employment in any of the employments enumerated herein, though not seriously and permanently

4 "Secondary stage" means that definite and specific physical signs of silicosis are or have been present and that capacity for work is seriously and permanently-partially impaired by the disease in consequence of employment in any of the employments enumerated herein, but that the employee is not totally permanently disabled and can engage in other employment

5 "Final stage" means that definite and specific physical signs of silicosis are or have been present and that capacity for work has been totally and permanently impaired by the disease in consequence of employment in any of the employments enumerated herein, and that employee cannot engage in any employment

6 "Suspended" means that an employee, or an applicant for employment, in one of the employments enumerated herein has been examined by a physician and his physical condition has been found to be such that he should not engage in any of the employments enumerated herein, and that such employee has been apprised of his physical condition and advised not to engage in such employments

§ 61 Fibroid phthisis (silicosis) treated as accident The disablement of an employee engaged in any of the employments enumerated in section sixty-two, resulting in fibroid phthisis (silicosis) as herein defined, shall be treated as the happening of an accident within the meaning of this chapter and the practice and procedure provided in this chapter shall apply to all proceedings under this article, except where specifically otherwise provided herein

§ 62 Limitation of employments Notwithstanding the provisions of any other section of this chapter the application of this article shall be limited to the following occupations or employments Miners, quarrymen and tunnel workers, stone masons' work and granite cutting, pottery workers and persons employed in the manufacture of refractory silica bricks and flint knapping

§ 63 Right to compensation If an employee is disabled or dies and his disability or death is caused by silicosis as defined herein, and the disease is due to the nature of the employment as herein described, he or his dependants shall be entitled to compensation in accordance with the provisions of this article

§ 64 Duties of employers It shall be the duty of every employer in any of the employments enumerated herein

1 To cause to have made a medical examination of every person in his employ who is exposed to silica dusts, within three months after this article takes effect, to cause to have made a medical examination of every applicant for employment in any process where silica dusts exist, to cause to have made a biennial medical examination of every person in his employ who is exposed to silica dusts, at such time and in such manner as the commissioner shall determine If such medical examination shall disclose evidence of silicosis in any stage the employee or the applicant for employment shall be suspended

2 To refuse employment to any person in any process wherein silica dusts exist if the medical examination discloses (a) that the chest is not of average development with satisfactory expansion, (b) that there is a deformity or obstruction of the upper air passages or elsewhere which interferes with respiration, (c) that there are signs of present or past disease of the lungs or heart, (d) that there are signs of present or past tuberculosis of any region

3 To use every reasonable means to exhaust or so dispose of silica dusts as to minimize the hazard

4 Violation of this section shall constitute a misdemeanor punishable, for the first offense, by a fine of fifty dollars, for the second offense by a fine of one hundred dollars, and for the third offense by a fine of one thousand dollars or one year in jail, or both

The industrial board shall prescribe forms or make rules for carrying into effect the provisions of this section

§ 65 Duties of employees It shall be the duty of every employee or applicant for employment in any of the employments enumerated herein

1 To submit himself to medical examination as herein provided

2 To furnish true information to his employer or prospective employer regarding his past employment in the employments enumerated herein

The industrial board shall, if necessary, make rules for carrying into effect the provisions of this section

§ 66 Medical examinations There shall be a written report for every medical examination made under the provisions of this article, in which the physician shall definitely certify to

# State Department of Health

## CENSORSHIP OF RADIO STATIONS BROADCASTING HEALTH TALKS NEEDED

Since March, 1922, the New York State Department of Health has broadcasted a health talk weekly from station WGY, Schenectady. The United States Public Health Service and a few other States have maintained similar services. The good which has resulted through spreading reliable information to vast unseen audiences can not be measured, but it is undoubtedly one of the best, if not the best means of promoting the education of the public in matters of health.

Unfortunately, quacks, fakirs and charlatans have not been slow to recognize its advantages, and some broadcasting stations have evidently not had the proper kind of censorship over material broadcasted or else their censors have failed to recognize the difference between the true and the false. Some time ago one of the larger stations on the Atlantic seaboard allowed a food faddist to

broadcast personal notions regarding diet and its supposed effect in the development of cancer. More recently a talk on drugless therapy was given from a station controlled by a newspaper. In this talk misstatements regarding the manufacture of diphtheria antitoxin were made and its value in curing diphtheria ridiculed.

Evidently there is need for some form of control over the kind of material allowed to be broadcast. That some action along this line will sooner or later be demanded is indicated by a recent action of the California State Medical Association in establishing a Medical Radio Broadcasting Committee, which is charged with the promulgation of a set of rules to be observed by the members of the association and the presentation of a resolution regarding the subject to the American Medical Association.

---

## AN INTERESTING CASE OF CEREBROSPINAL MENINGITIS

Dr W H Munson, District State Health Officer, was recently called in consultation by a local health officer to see a boy nearly two years old, who had been taken ill with sore throat and fever. Diphtheria was suspected and 36,000 units of antitoxin were administered. A throat culture was later reported negative. Two days after the onset a rash developed which was well distributed over the body, legs and arms. The child continued to have a fever (102 deg F) with profuse discharge from the nose and throat and with marked enlargement of the cervical glands.

At the time of examination there was a marked discharge of a milky secretion from the throat and nose, which was easily wiped out. No membrane could be seen. Babinski's sign was present. Knee jerks were absent, likewise the cremasteric reflexes. There was apparently rigidity of the back and neck muscles. The rash was like that seen on persons exposed to intense cold,—mottled, dark

purple, irregular in shape,—giving a lace-work effect. It was not elevated and it faded on pressure. It covered the forearms and lower legs, little suggestion of it being left on the body and none on the face. Pupils were mid-wide, regular, with sluggish reaction to light, no strabismus. Mental condition was semi-stuporous. There was marked bilateral enlargement of cervical lymph nodes. There was involuntary passage of urine.

Dr Munson states that his tentative diagnosis was meningitis. He advised spinal puncture and offered to do it, but this was not accepted. Later a spinal puncture was made but owing to the presence of a great deal of blood in the fluid it proved to be of little value as a diagnostic aid. Later he again saw the case with the health officer and a specialist. On this second examination there was no doubt about the diagnosis, as marked retraction of the head, rigid back and pronounced Kernig's sign had developed.

son, or to such other nursing duties as may seem appropriate to such committee. Except as hereinafter provided, the state commissioner of health or his authorized representatives shall have power to maintain general supervision over the work of such nurses.

With the approval of such committee the trustee or board of trustees of any common school district or the board of education of any union free school district within the county, may designate any such nurse as a school nurse, to perform, in addition to her other duties, the duties of a school nurse for any school or schools under such respective trustee, board of trustees or board of education. Any such nurse so designated shall perform her duties as school nurse under the direction of the appropriate school authorities and under the provisions of the education law and under the regulations prescribed pursuant thereto.

The board of supervisors may appoint an advisory committee of citizens, of whom at least one shall be a physician and at least one a woman, to advise with and assist the heretofore mentioned committee on public health in the organization and direction of the work of such public health nurses.

§ 2 This act shall take effect immediately.

A Int No 413 (conc S Int 282)—See concurrent Senate Int No 282 for digest.

No action on bill as yet.

Int 413

January 26, 1925

Introduced by Mr Wallace

#### AN ACT

To amend the public health law, in relation to violations of rules or orders of local boards of health.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows:*

Section 1 Section twenty-one of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," as last amended by chapter five hundred and forty-nine of the laws of nineteen hundred and thirteen, is hereby amended to read as follows:

§ 21 General powers and duties of local boards of health. Every such local board (remainder same as old law) in junction such violations, or otherwise to enforce such orders and regulations. (New matter begins here.) Every such local board of health may prescribe that a person who wilfully violates or refuses or omits to comply with any lawful order or regulation prescribed by it or a local health officer, shall be guilty of a misdemeanor punishable by a fine not exceeding fifty dollars or imprisonment not exceeding six months, and a court of special sessions in the territory over which such local board

has jurisdiction shall have jurisdiction of such misdemeanor. (New matter ends here.)

§ 2 This act shall take effect July first, nineteen hundred and twenty-five.

A Int No 414 (conc S Int 278)—See concurrent Senate Int No 278 for digest.

No action on bill as yet.

A Int No 422—A bill introduced in the Assembly by Assemblyman Samuel Rosenman of New York County, would amend section 352, Civil Practice Act, by providing physicians and nurses may disclose professional information as witnesses in action to annul marriage on ground of fraud.

Referred to Codes Committee.

No action on bill as yet.

Int 422

January 26, 1925

Introduced by Mr Roseman.

#### AN ACT

To amend the civil practice act, in relation to the competency of testimony of physicians in certain cases.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows:*

Section 1 Section three hundred and fifty-two of the civil practice act is hereby amended to read as follows:

§ 352 Physicians and nurses not to disclose professional information. A person duly authorized to practice physic or surgery, or a professional or registered nurse, shall not be allowed to disclose any information which he acquired in attending a patient in a professional capacity, and which was necessary to enable him to act in that capacity, except, as a witness in an action to annul a marriage on the ground of fraud pursuant to the provisions of section eleven hundred and thirty-nine, unless, (remainder same as old law).

§ 2 This act shall take effect immediately.

A Int No 434—A bill introduced in the Assembly by Assemblyman Jerome C Ambro of Kings County, would amend section 355, Prison Law, by providing for removal to hospitals of prisoners confined either for civil or criminal cause, when they require immediate medical or surgical treatment.

Referred to Penal Institutions Committee.

No action on bill as yet.

A Int No 536 (conc S Int 351)—See concurrent Senate Int No 351 for digest.

No action on bill as yet.

A Int. No 570 (conc S Int 380)—See concurrent Senate Int No 380 for digest.

No action on bill as yet.

A pleurisy with effusion may be the first evidence of tuberculosis

Moist rales, localized above the third rib, constitute the most common sign of beginning tuberculosis. But the lesion may be anywhere else in the lung. This sign is one of the most difficult for an untrained physician to elicit. It requires some degree of skill on the part of the physician, and co-operation from the patient.

It is important to know when an X-ray picture is needed. An X-ray may show evidences of tuberculosis when no physical signs are present. On the other hand, the X-ray will reveal persisting tuberculous lesions which have healed, and yet may continue to give out crackling rales. The determining factor in the diagnosis of active disease is the presence or absence of constitutional disturbance.

Some cases of chronic fibrosis are carriers and spreaders of tuberculosis germs, for their lesions are progressive, and show a continual balance between extension and healing. They have a cough and emphysema with asthma, and are not sick enough to stay at home and take care of themselves. These cases are a menace to the community.

It is important to remember that chest conditions may be secondary to infections of the upper respiratory tract. A persistent bron-

chitis may clear up when the tonsils or sinuses are cured.

I will now show some lantern slides of X-ray pictures in which the X-ray was the determining factor in diagnosis.

Case One showed no physical signs. There was a cough for six months. The patient came for examination because of enlargement of the cervical glands. X-ray showed a dense area in one apex.

Case Two had digestive disturbances and a dry cough. The only physical sign was a slight dullness at one apex. The X-ray showed that apex to have a considerable involvement.

Case Three showed hemoptysis, positive sputum, and fever, with no physical signs. The X-ray showed a dense involvement in the root of one lung.

Case Four had an ischio-rectal abscess which healed in two months. There were no physical signs in the lungs. The X-ray showed an involvement of the middle of the right lower lobe.

In conclusion, remember, when examining a patient, to pick up the small signs and symptoms, even though they stretch over a history of several years, and piece them together into a clinical picture. This is not only a great service to the patient, but a very fascinating and satisfying achievement for the examining physician.

## BRONX COUNTY MEDICAL SOCIETY

The regular meeting of the Bronx County Medical Society was held at Hollywood Gardens January 21, 1925. The meeting was called to order at 9 P. M. the retiring President, Dr. Podvin, in the Chair.

Dr. Podvin addressed the members briefly outlining the work of the past year. He then presented Dr. S. M. Jacobs, the new president, who addressed the Society as follows:

"With the unprecedented growth of the Bronx County Medical Society, with the corresponding increase of members, the question of obtaining suitable quarters for our meetings commanded the attention of the previous administration and the solution of it was left to the incoming administration as a legacy. Though our borough has expanded it lacks adequate meeting places which would befit the dignity of our Society. The idea of building a home which would constitute the Medical Center in the Bronx has been conceived during the administration of my predecessor, Dr. Podvin. Yet ideas however exalted do not constitute the means for their realization. There will be no immediate solution to this momentous question unless each and every member is willing to subscribe to the Building Fund and to the raising of the annual dues from fifteen to twenty-

five dollars; else we will be obliged to lead a nomad's existence—meeting here and there for quite some time to come.

"As the success of the Society depends largely upon the numerical strength and the cooperation of its members, so the scientific sessions depend mainly upon the papers read and cases presented. There were underground rumblings, general dissatisfaction and open criticism that the papers presented were of no interest to the general practitioner and that the Scientific Committee has been lax and derelict in its duties. To overcome what seems to be unwarranted objections, we deemed it advisable to enlist the assistance of men well known in the medical world. Physicians of national reputation have signified their willingness to appear and read papers before this Society during the ensuing year. This, however, does not preclude members from presenting cases and participating in the discussions.

"Medicine from its very inception had to contend with and combat various cults, quacks and medical charlatans. Alchemy, astrology, priestcraft of the middle ages have been superseded by chiropractors, naturopaths, Christian Scientists, who arrogated to themselves the divine power of healing. Yet at no time have the cults made such

# NEWS NOTES

## PERIODIC HEALTH EXAMINATIONS IN NEW YORK COUNTY PRE-CLINICAL SIGNS OF DISEASE OF THE RESPIRATORY SYSTEM

By JAMES ALEXANDER MILLER, M D,  
NEW YORK.

Abstract of the ninth lecture in the Symposium on Periodic Health Examinations given in the New York Academy of Medicine on January 20, 1925, under the auspices of the Medical Society of the County of New York.

Pulmonary tuberculosis is by far the most common respiratory affection with which a physician will have to deal when he makes a periodic health examination. It comes on insidiously, like many other chronic diseases, and one cannot say just when the patient becomes slightly ill. A large responsibility is on the examining physician to determine where the border line is between health and disease.

The physician often runs across tuberculosis unexpectedly. It is such a big problem, and takes such a heavy toll in strength and lives that every physician must have it constantly in mind, be he a family doctor, an insurance examiner, or a physician in an industrial plant.

A family physician often knows a patient so well that he does not notice deviations from normal health. This accounts for many delays in the diagnosis of tuberculosis.

Another factor in delayed diagnosis is that the patient often comes to the physician in a casual manner, and demands merely a tonic because he does not feel just right, and will usually refuse to submit to an examination either from fear or from economy. A delay in diagnosis is not always the fault of the doctor, but still a great responsibility is on him.

There are other suspicious signs of pulmonary tuberculosis besides those in the chest.

If any person is below par in health and vigor, remember tuberculosis as a possibility.

It is a mistake to place undue stress on physical signs in the chest. Most physicians learn physical diagnosis by the examination of tuberculosis chests, and if they do not find physical signs readily, they are likely to conclude that tuberculosis is not present. Early tuberculosis often shows no physical signs on inspection, percussion, palpation, and auscultation. When physical signs are discoverable, tuberculosis has existed for a considerable time in most cases, and on tracing back the history, the physician will find a history of a series of relapsing infections whose evidences will be attacks of indigestion, or repeated colds which last for some time, or so-called malaria,

or cough, or fever, or pleurisy with effusion. There may have been an ischio-rectal abscess, or a spitting of blood which was ascribed to the throat. Such attacks may be spread over ten years, and during all that time tuberculosis may have been their sole cause. When a patient improves in intervals between attacks, the physician flatters himself that he has cured the trouble, but the tuberculosis condition continues exactly the same as before. Yet this is the stage when recovery may be expected in nearly every case. The intermissions in the symptoms and the apparent cures between the attacks are indications that the body has the power to overcome the disease if the physician will guide the patient in his mode of life. A physician has a great opportunity to recognize the tuberculous condition before the patient is worn out with cough, fever, and night sweats.

It is the duty of a physician who makes a periodic examination to get a full picture of the patient's health extending back for several years, and to pay particular attention to constitutional disturbances, such as malaise, fatigue, indigestion, and irritability. He will particularly look for slight signs of which a patient makes light. The very fact that the patient tries to explain them away is evidence that they exist and are annoying him.

There is danger of exaggerating the importance of physical signs. Dr Lawrason Brown gives five cardinal evidences of tuberculosis:

- 1 Positive sputum
- 2 Definite hemoptysis
- 3 Pleurisy with effusion
- 4 Localized rales on coughing at the apex
- 5 Characteristic X-ray changes at an apex

One or more of these signs will be present in almost every case.

The sputum will not usually show tubercle bacilli in the early stage of tuberculosis. The bacilli appear only in a later stage when the tubercles break down and ulceration occurs.

If hemoptysis is present, it is important to determine the source of the blood, whether from the lungs or the nasopharynx.

A pleurisy with effusion may be the first evidence of tuberculosis

Moist rales, localized above the third rib, constitute the most common sign of beginning tuberculosis. But the lesion may be anywhere else in the lung. This sign is one of the most difficult for an untrained physician to elicit. It requires some degree of skill on the part of the physician, and co-operation from the patient.

It is important to know when an X-ray picture is needed. An X-ray may show evidences of tuberculosis when no physical signs are present. On the other hand, the X-ray will reveal persisting tuberculous lesions which have healed, and yet may continue to give out crackling rales. The determining factor in the diagnosis of active disease is the presence or absence of constitutional disturbance.

Some cases of chronic fibrosis are carriers and spreaders of tuberculosis germs, for their lesions are progressive, and show a continual balance between extension and healing. They have a cough and emphysema with asthma, and are not sick enough to stay at home and take care of themselves. These cases are a menace to the community.

It is important to remember that chest conditions may be secondary to infections of the upper respiratory tract. A persistent bron-

chitis may clear up when the tonsils or sinuses are cured.

I will now show some lantern slides of X-ray pictures in which the X-ray was the determining factor in diagnosis.

Case One showed no physical signs. There was a cough for six months. The patient came for examination because of enlargement of the cervical glands. X-ray showed a dense area in one apex.

Case Two had digestive disturbances and a dry cough. The only physical sign was a slight dullness at one apex. The X-ray showed that apex to have a considerable involvement.

Case Three showed hemoptysis, positive sputum, and fever, with no physical signs. The X-ray showed a dense involvement in the root of one lung.

Case Four had an ischio-rectal abscess which healed in two months. There were no physical signs in the lungs. The X-ray showed an involvement of the middle of the right lower lobe.

In conclusion, remember, when examining a patient, to pick up the small signs and symptoms, even though they stretch over a history of several years, and piece them together into a clinical picture. This is not only a great service to the patient, but a very fascinating and satisfying achievement for the examining physician.

## BRONX COUNTY MEDICAL SOCIETY

The regular meeting of the Bronx County Medical Society was held at Hollywood Gardens January 21, 1925. The meeting was called to order at 9 P. M., the retiring President, Dr. Podvin, in the Chair.

Dr. Podvin addressed the members, briefly outlining the work of the past year. He then presented Dr. S. M. Jacobs, the new president, who addressed the Society as follows:

"With the unprecedented growth of the Bronx County Medical Society, with the corresponding increase of members, the question of obtaining suitable quarters for our meetings commanded the attention of the previous administration and the solution of it was left to the incoming administration as a legacy. Though our borough has expanded, it lacks adequate meeting places which would befit the dignity of our Society. The idea of building a home which would constitute the Medical Center in the Bronx has been conceived during the administration of my predecessor, Dr. Podvin. Yet ideas however exalted do not constitute the means for their realization. There will be no immediate solution to this momentous question unless each and every member is willing to subscribe to the Building Fund and to the raising of the annual dues from fifteen to twenty-

five dollars, else we will be obliged to lead a nomad's existence—meeting here and there for quite some time to come.

"As the success of the Society depends largely upon the numerical strength and the cooperation of its members, so the scientific sessions depend mainly upon the papers read and cases presented. There were underground rumblings, general dissatisfaction and open criticism that the papers presented were of no interest to the general practitioner and that the Scientific Committee has been lax and derelict in its duties. To overcome what seems to be unwarranted objections, we deemed it advisable to enlist the assistance of men well known in the medical world. Physicians of national reputation have signified their willingness to appear and read papers before this Society during the ensuing year. This, however, does not preclude members from presenting cases and participating in the discussions.

"Medicine from its very inception had to contend with and combat various cults, quacks and medical charlatans. Alchemy, astrology, priestcraft of the middle ages have been superseded by chiropractors, naturopaths, Christian Scientists, who arrogated to themselves the divine power of healing. Yet at no time have the cults made such

inroads and plied their nefarious trades upon the credulous, ignorant and the unwary as in this enlightened twentieth century. Their success may be attributed partly to our failure to understand the psychology of our patients. In our honest endeavor to combat disease, we have learned to regard a patient as a component of cells and tissues which have been permeated by microbes, we talk to him in terms of serums, vaccines, toxins and antitoxins and are prone to forget that he has a soul. Restricted by no code of ethics and hindered by no conscience, the adherents of the various cults utilize the lay press in promulgating and extolling the virtues of their craft, deriding and minimizing the true value of scientific medicine. It is true that the State through its Legislature should intervene and by legal enactments stop their nefarious activities. Our legislators, however well meaning, possess very little knowledge pertaining to public health and lack knowledge of the rudimentary principles of medicine upon which the health of the community depends. They fall gullable victims to any legislation in behalf of the cults due to the indifference of the medical profession at large and to the pressure exerted upon them by those interested in the passage of such bills. I would urge the Committee on Legislation to invite the respective Assemblymen and Senators and in a heart to heart talk discuss the various health bills that have been introduced affecting the medical profession and thereby the health of the community. I would also urge the Committee on Public Health to inaugurate a campaign of public health education and through the lay press acquaint the public with the true meaning, value and importance of scientific medicine as compared with the teachings of the cults. This should be carried out in a dignified manner lest we be accused of selfish and sinister motives.

"May I digress a moment to utter a word of praise and commend His Honor, our Governor, for his Message to the Legislature suggesting an amendment to the present Medical Practice Act, which would facilitate the prosecution and conviction of all illegal practitioners.

"In this era of preventive medicine, the endeavor of the medical profession is concentrated solely upon the prolongation of human life by halting and arresting disease in its incipency. The first to perceive the efficacy of periodic health examinations from a commercial standpoint was the New York Life Extension Institute. It employs members of our profession to conduct the examinations, exploiting the latter's knowledge for self-aggrandisement. The Metropolitan Life Insurance Company grants periodic examinations to its policy holders gratis. The Cornell Pay Clinic is, as I view it, another health center. The Post-Graduate Hospital announced recently its

intention of introducing a Health Service Clinic "with the purpose of aiding those who cannot afford a private physician" charging a mere pitance of five dollars for an examination to cover "the operating expense of the clinic." It is indeed high time that the members of our Society should awaken from their lethargy and assume the initiative in conducting the periodic examinations of their own patients. Both the Economic and Public Health Committees should devise ways and means for conducting such examinations by the family physicians.

"It is with great reluctance and some misgivings that I am to dwell in brief on an article which appeared recently in a lay periodical affecting the integrity and standing of the family physician. Supposedly an interview with some members of the American College of Surgeons, the author quoting no one in particular, casts aspersions and condemns the entire profession. The failure of the surgeons to repudiate the interview is but a tacit acknowledgment of their guilt. Without dwelling upon the charges, I vehemently resent and condemn the utilization of the lay press to ventilate their grievances. Such articles will have no salutary effect, but on the contrary will tend to undermine the confidence and sever the friendly relations between the patients and the family physician and to create converts to the cults.

"In conclusion permit me to assure you of my sincere appreciation of the honor you have conferred upon me. Sensitive as I am of the honor, I am conscious of the duties and responsibilities it entails. Should I, however, as presiding officer inadvertently overstep my prerogatives, I will merely ask your indulgence, forbearance and, above all, your cooperation."

Drs Benjamin H Archer, Nathan J Lapkin, Leon Peisachowitz, Henry I Scheer, Norman Strauss and Samuel Weinstein, were elected to membership.

#### THE SCIENTIFIC PROGRAM

The Clinical Symptoms of Coronary Occlusion, Louis Hamman, M D

Discussion by Drs Emanuel Libman, Harold E B Pardee, Bernard S Oppenheimer (by invitation), Henry Roth, Boas Ginzburg and J B Cohen

Dr Podvin moved that a vote of thanks be extended to Dr Hamman and the visitors who participated in the discussion.

This motion was unanimously carried by a rising vote.

The meeting adjourned at 11 15 P M

I J LANDSMAN, Secretary

## ACTIVITIES OF THE CAYUGA COUNTY MEDICAL SOCIETY

During the year 1924, the County Medical Society, through its Committee on Public Health and Sanitation, consisting of Dr C F McCarthy, Auburn, chairman, Drs H I Davenport and George C Sincerbeaux, Dr C E Goodwin, Weedsport, and Dr N L Woodford, Union Springs, were instrumental in accomplishing the three following projects

First The formation of a Committee for the eradication of bovine tuberculosis in Cayuga County Its representative on this Committee, the Chairman of the Committee on Health and Sanitation, appeared before the Board of Supervisors and obtained an appropriation of \$5,000 for the year 1924, and a like appropriation for this year, 1925 The Chairman of the Health and Sanitation Committee is a member of this Committee on the eradication of bovine tuberculosis, employing a full time county veterinarian Thousands of head of dairy cattle have already been examined for tuberculosis The County Medical Society obtained the petition of twenty-

one fraternal organizations of Auburn and Cayuga County in favor of this project

Second The County Medical Society was represented by Drs McCarthy, Sincerbeaux and Davenport on the Commission that prepared the milk code for the City of Auburn, which went into effect January 1st of this year, being a form of the Model Milk Code, allowing only a raw tuberculin tested and pasteurized milk to be sold within the City of Auburn

Third The County Medical Society, at the largely attended meeting held June 27, 1924, unanimously passed a resolution in favor of placing laboratories under state supervision and state aid The Medical Society made a vigorous campaign in favor of this, and obtained appropriation for the first year of \$12,000 It is represented on the Board of Managers by Dr H I Davenport for the term of five years, and Dr C F McCarthy for the term of four years

C F MCCARTHY

## THE MEDICAL SOCIETY OF THE COUNTY OF QUEENS

At the regular meeting of the Medical Society of the County of Queens, held at Jamaica, N Y, on January 28th, Dr Alfred C Beck read a paper entitled "The Management of the Late Toxemias of Pregnancy" Dr Beck divides the late toxemias into two classes

In the first class, including the patients suffering from nephrosis, the symptoms are apt to appear suddenly in patients previously in good health, and convulsions are apt to appear soon after onset of symptoms, following delivery or recovery patients rapidly improve and are not particularly prone to have recurrences in future pregnancies The patients in the other group, or those suffering from nephritis, are apt to show symptoms of toxemia early in pregnancy, with a gradual increase of severity, develop convulsions late, and after delivery or recovery improve slowly, and are apt to have repetition of the toxemia in future pregnancies Dr Beck emphasizes the importance of prophylaxis in the treatment, and in the presence of symptoms of toxemia, i.e, high bloodpressure, albuminuria, headache, oedema, or visual disturbance, advises eliminative and dietary treatment with rest and termination of the pregnancy, if the patient grows worse rapidly In the treatment of eclampsia, Dr Beck reported 48 cases treated consecutively at the Long Island College Hospital, the treatment including large doses of morphine, early phlebotomy, and avoidance of any interference that

might give rise to a convulsion This gave a much lower mortality than other methods of treatment

Dr T C Chalmers reported a case of influenza-pneumonia, type II, with adherent pericardium, the report being followed by a discussion by Dr T Stuart Hart and Dr L E LeWald

The President announced the appointment of Dr E A Flemming as Chairman of the Membership Committee, Dr D E McMahanas, Chairman of the Legislative Committee, and Dr W C A Steffen, as Chairman of the Committee on Publicity and Public Health Instruction, the last committee to undertake the publication of a monthly bulletin, to begin immediately

A resolution was adopted putting the Society on record as opposed to the so-called Narcotic, Medical Inspection, and Chiropractic Bills, and instructing the Secretary to urge the legislators from the County to vote against these bills

The following resolution was passed

"Resolved, that the approved sign for members of the Queens County Medical Society shall consist of the physician's name, with the title Dr, or preferably M D, that no other sign relating to the specialties shall be placed outside the building or in the window, but that if a member practicing one of the specialties desires to display such a sign inside the building, it shall be permissible"

J S THOMAS

# THE DAILY PRESS

The Poughkeepsie *Eagle*, January 17th, contains an account of the completion of the first student field practice in rural nursing, which was conducted in Pleasant Valley under the auspices of the Pleasant Valley Health Committee and the Teachers' College of Columbia University. The clipping gives the following description of the work

"The Dutchess County Health Association plans to receive a limited number of students for similar field practice at regular intervals. These nurses are enrolled students at Teachers' College who have taken a year's course in public health nursing as part of their college work. All of them have had previous successful experience in public health nursing in city work. The three months period in Dutchess County is for the purpose of giving them experience in rural nursing, which presents many problems quite different from city nursing due to extent of territory and the homes which have to be visited. Rural public health nursing has developed so rapidly in the past five years that it is only recently that educational institutions have recognized the fact that special preparation for this field will eliminate a great deal of the trial and error method which has prevailed hitherto. The Dutchess County Health Association is thus making a generous contribution to nursing education as it offers a practice field in rural sections through its affiliation with Teachers' College."

We have commented favorably on the publicity that has been given to the Mental Clinics which have been conducted under the auspices of the State Hospital Commission and the State Commission for Mental Defectives. The Glens Falls *Times*, January 22, contains an account of the Clinics which are held every month in Glens Falls. The article says

"Dr. R. D. Helmer, senior assistant physician of the Utica State Hospital, will see those who come for advice concerning mental or nervous conditions. He will be assisted by Miss Eva Schied, social worker, from that hospital. Dr. E. DuBois Elliott will see persons interested in backward or problem children, and will be assisted by Miss Luella Oagley of the State Commission for Mental Defectives.

"Children who have difficulty in doing school work, who are irritable, quarrelsome, hard to manage, nervous or retarded in mental or physical development, will find help at this clinic. All children should be accompanied by some-

one who can give the examiner a good history of the child's development and habits.

"Adults who show early symptoms of mental or nervous disorder and those whose mental condition is more marked, will also find this clinic to be of inestimable value to them, as the main object is to give advice and treatment to prevent further development. All consultations are confidential and no fee is charged.

"The aim is to co-operate with all local physicians and others who are interested in persons suffering from mental or nervous afflictions and to do everything possible along the lines of prevention. In cases where there is a family physician advice is given the patient and he is referred back to his physician for further care and treatment.

"The clinic is also for persons who are paroled from the State hospitals and who require further supervision and care to enable them to adjust themselves to outside surroundings. The number of clinics is gradually being extended throughout the State and from two to five clinics are being conducted by each State hospital every month in various localities. All of the physicians at these clinics are well trained in mental conditions and are competent to give the necessary advice.

"It is recommended that these clinics be used freely as consultation centres and that the general public avail themselves of their use."

We quote the article at some length because it is well calculated to educate the people generally in the possibility of diagnosing and treating nervous disorders. People generally do not realize that the development of the troubles can be arrested and that mental disorders may often be cured. We hope to see more articles like that in the Glens Falls *Times*.

The Geneva *Times*, January 22, contains an account of the address of Dr. Robert S. Breed, City Bacteriologist, before the Kiwanis Club on the subject of milk. He emphasized the care of milk bottles by the customers before the bottles are returned to the dairy. This is a phase of the problem which is not mentioned as often as it should be. The people who buy milk have a great responsibility in providing a pure milk supply. The article says

"There is a city ordinance which provides that milk bottles must be kept clean, and we

are now engaged in a campaign to keep milk bottles in better condition. We have more trouble with the men than with the women. All that we ask is to have the milk user rinse out the bottle so that it can be thoroughly sterilized when it is returned to the dealer. The ordinance says that milk bottles must be used for nothing other than milk containers, yet many times children are permitted to use them as playthings to scoop water out of the gutter. Women often come in to grocery stores and ask to have milk bottles filled with kerosene or vinegar.

"Men working on buildings are also offenders. They take milk with them for lunch and then throw the bottles away. The bottles lie around for some time and then are finally picked up and taken back to the station. Coffee is also allowed to dry into stains on the bottles and all these bottles must be washed by hand before they can be sterilized. The whole responsibility is not placed upon the public, for the drivers must collect the bottles and not permit them to stand around."

The relation of oysters to typhoid fever continues to be a leading topic for discussion, especially in the newspapers published in and around New York City. The agitation has led Departments of Health to plan thorough investigations of sewage discharging upon oyster grounds, and it may be expected that the certification of oyster grounds by the Health Departments will be a reliable indication that oysters from those sources may safely be eaten raw or in any other way. If this is done, the only remaining source of danger is the dishonesty of dealers in substituting oysters from polluted waters for those from certified grounds.

While many of the articles that have appeared in the newspapers have tended to increase the unreasoning fear of oysters, the following editorial from the *Utica Observer-Dispatch* is sane and sensible.

"The oyster industry has been shattered by the suspicion that has been cast upon oysters in connection with the typhoid cases in New York, Chicago, and some other cities. Thousands of people who are usually well employed throughout the winter and until the coming of warm weather, are out of work, and large sums of money invested in oyster beds and dredging and shipping equipment is making no return.

"And the worst of it all is that there is no positive evidence that oysters caused the disease.

"It may be that there is some particular section where oyster beds have become contaminated, and the one spot has caused all the mischief. Officials of the Department of Agriculture and the Public Health Service have made close examination of Long Island oyster beds and report especially as to those at Great South Bay that there is no contamination. Baltimore, which is a great oyster center, declared that there is no contamination in the beds of the Chesapeake Bay. There has been no falling off in the consumption of oysters in Baltimore and the surrounding cities and towns, and there has been no appearance of typhoid. The industry in the Chesapeake, which a week ago was flat, is again picking up and several plants have resumed work.

"There has been no danger whatever from properly cooked oysters, and it has been stated that if typhoid has resulted anywhere from the use of oysters, it has been from those eaten raw.

"The trouble teaches a tremendous lesson. If this great source of food, either shellfish or fish, cannot be kept free from contamination, then the public has lost the power to protect itself. Somewhere there has been failure and neglect. Polluted streams, bays, coves, inlets have been tolerated for the sake of saving somebody an expenditure that would prevent the pollution."

# BOOK REVIEWS

**THREE PROBLEM CHILDREN** Narratives from the Case Records of a Child Guidance Clinic Publication No 2 of the Joint Committee on Methods of Preventing Delinquency, 50 East 42nd Street, New York City Octavo of 146 pages Price, \$1.00

Modern psychiatric knowledge is producing increasing evidence that adult criminality has its genesis in childhood and in the very roots which cause unhappiness, maladjustment, and conduct problems in children. A comprehensive survey of the sociological mental and physical factors in the behavior difficulties in children will lead to an understanding of the causes of not only juvenile delinquency but also of adult maladjustment and criminality, and will tend to the institution of effective prophylactic measures.

In publishing *Three Problem Children*, the Joint Committee on Methods of Preventing Delinquency has successfully demonstrated the feasibility of the application of modern psychiatric knowledge to the management of behavior difficulties in children. The book presents three case histories from the records of the large number of children who have been brought to the Bureau of Children's Guidance because they were presenting conduct disorders which could not be corrected by the parents or teachers. The first history is of a congenitally syphilitic girl, of normal intelligence but of poor heredity, retarded in school, very unhappy and on the verge of a serious mental break. The second is of a boy of superior intelligence, overstimulated and overpraised, raised in an unhappy and unwholesome environment, who was failing in school. The third is of a boy of inferior intelligence but possessing special aptitudes and abilities, who was embarking on a delinquent career.

The method of approach to the solution of the problems presented by each of these children is presented in a clear and literary style, and in a convincing, logical manner. The importance of the psychiatrist, the psychologist, and the social service worker in the management of conduct disorders is demonstrated in a forceful manner. This book will appeal to all interested in conduct disorders both in children as well as in adults. Because it is written in a style that will attract not only professional people but also laymen, the book is bound to contribute materially to the proper management of delinquency and maladjustments.

IRVING J SANDS, M.D.

**MATERNITY NURSING IN A NUTSHELL.** By ELIZABETH H WICKHAM, R. N. 28 illustrations. F. A. Davis Co., Philadelphia, 1924. Price, \$1.50 net.

The parts of this little work relating to maternity nursing, per se, are good, but the usefulness and value of the chapters relating to maternity diagnosis and treatment have been sacrificed because of brevity.

G. W. PHELPS

**NEW VIEWS ON DIABETES MELLITUS** By P. J. CAMMIDGE, M.D., and H. A. H. HOWARD, B.Sc. Octavo of 611 pages, illustrated. London, Henry Frowde & Hodder & Stoughton. New York, Oxford University Press, 1923. Cloth, \$6.50.

This work is based upon a large experience in the disease. The authors state that in their investigations they have made over 15,000 analyses of specimens from more than 1,200 cases of diabetes and glycosuria. Normal and abnormal carbohydrate metabolism are fully discussed and more space is given to the "non-pancreatic" causes of hyperglycemia and glycosuria than is the custom of most American writers. About one-half of the book is devoted to the treatment of true diabetes

and other glycosurias. Many views expressed are based upon original work.

The writers believe that it is never wise to allow the proportion of fat to carbohydrate to exceed 3 to 2. More fat than this is stated to be followed by ketonuria and lowering of carbohydrate tolerance.

In renal glycosuria they have found an absolute reduction in the calcium content of the blood and in true diabetes a relative reduction arising from dilution of the whole blood. The administration of calcium salts alone by mouth had little or no effect upon the percentage of calcium in the blood, but when in addition, a tenth of a grain of parathyroid was given at night, the desired result was brought about in some instances. The basis of this treatment is the belief that the persistently low proportion of calcium in the blood might be dependent upon parathyroid insufficiency.

Citing Allen's experiments by which he showed that ligation of the pancreatic duct prevents the appearance of diabetes and checks an existing glycosuria resulting from partial pancreatectomy in dogs, the authors have conceived this theory that by giving belladonna or atropine, they could conserve the functioning pancreatic remnant solely for the production of its internal secretion by preventing the formation of the external secretion. Given at a suitable interval before meals, this drug is said to be capable of preventing the rise in the sugar content of the blood which would otherwise have occurred.

W. E. McCOLLUM

**DISEASES OF THE MALE ORGANS OF GENERATION** By KENNETH M. WALKER, M.A., M.B. B.C. Octavo, 234 pages, illustrated. London, Henry Frowde & Hodder & Stoughton. New York, Oxford University Press, 1923. Cloth, \$4.00.

This brief little work of some two hundred pages covers the subject of the non-venereal diseases of the male seminal tract. It is a condensed, practical, clinical treatise, written in a manner intended for the student and busy general practitioner. It is a storehouse of valuable information both in diagnosis and treatment. The medicinal and minor surgical procedures are given greater space than the major surgical for obvious reasons.

The author expresses the belief that the subject of Andrology, or the study of disease of the seminal tract will one day receive greater attention and recognition, as being, in a large measure, independent of that of the urinary tract.

AUGUSTUS HARRIS

**GYNOECIOLOGY** By DAVID THOMPSON, O.B.E., M.B. Large Octavo, 519 pages, illustrations and plates. London, Henry Frowde & Hodder & Stoughton. New York, Oxford University Press, 1923. Cloth, \$12.75.

It is impossible, in a few lines, to express a fair estimate of this exhaustive and strictly scientific work.

The five hundred pages are devoted largely to an extensive compilation of the author's laboratory research and reference work from 1916 to 1921, and include nearly two thousand references.

The book is divided into six parts, some of which are written by collaborators, and which cover every phase of the subject.

The reviewer feels that he has not seen the equal of a book of its kind up to the present time. Its value as a reference for pathologists, bacteriologists, practitioners, and urologists is beyond question.

## REVIEW OF FOUR YEARS' WORK WITH RADIUM IN GYNECOLOGY\*

By THOMAS P FARMER, M.D.,

SYRACUSE, N Y

SINCE October, 1919, we have employed radium in the gynecological clinics at the Syracuse Memorial Hospital, St Joseph's Hospital, Syracuse, and the Syracuse Free Dispensary attached to the Medical Department of Syracuse University. While the majority of the cases concerned in this analysis were in these different services, some others were referred by outside surgeons and some of the cases were treated at other hospitals, both in Syracuse and in other places. The amount of radium at our disposal has been 100 milligrams, of which two tubes each containing 25 milligrams were purchased in September, 1919, a similar tube acquired early in 1920, and two needles, representing together 25 milligrams, bought in December of the same year.

During this time 165 gynecological patients have been treated either in whole or in part by this method. The conditions and number of patients treated for each were as follows:

	No Cases	%
Cancer of cervix uteri	80	49
" of fundus uteri	11	7
" of ovary	6	4
" of vulva	13	8
" of bladder	3	4
" of urethra	4	
Fibroids	19	11
Hemorrhage of menopause	28	17
Caruncles	1	
	<hr/> 165	

The period covered by this report has been divided into years beginning from October 1st. Consequently the current or fifth year represents only a trifle over a six months' period. The number of cases treated by years is as follows:

October 1, 1919, to October 1, 1920, 36 cases, 22 per cent

October 1, 1920, to October 1, 1921, 47 cases, 29 per cent

October 1, 1921, to October 1, 1922, 29 cases, 18 per cent

October 1, 1922, to October 1, 1923, 27 cases, 16 per cent

October 1, 1923, to date, 25 cases, 15 per cent (6 months)

The difference between the larger number of cases treated during the first two years as compared with the smaller number during the following two years is explained by the fact that we were not asked later to treat so many far advanced cases of cancer of the cervix as we were during the first two years, and also by the use of radium by others who had earlier sent us cases, as well as the purchase of radium by the State Institute for the Study of Malignant Disease, at Buffalo.

The seemingly indicated large increase of cases for the current year might be explained by better appreciation of the value of radium on the part of the profession and public, as also a better recognition of the indication for its use, not only in cancer of the cervix but especially in hemorrhage cases.

### CANCER OF CERVIX UTERI

The eighty cases of cancer of the cervix were divided as follows, according to years:

First year, 26 cases, 32 per cent

Second year, 22 cases, 28 per cent

Third year, 15 cases, 19 per cent

Fourth year, 8 cases, 10 per cent

Fifth year, 9 cases, 11 per cent

The average age of these cases was 51.85 years, the youngest patient being 23 and the oldest 73 years of age. Seventy-seven patients were married, their average age being 52 years. Three patients were unmarried, their average age being 45.3 years. Gross evidence of delay in diagnosis and instituting some appropriate treatment on the part of the profession was markedly evident in

\* Read at the Annual Meeting of the Medical Society of the State of New York at Rochester April 23, 1924.

11 cases (14 per cent) Four of these cases were given wrong advice In two cases polypi were either insufficiently removed to furnish proper material for pathological examination, or no such examination was made These cases were of four and two years' standing This is in contrast to two other cases where by proper excision of the base of the polyp a very early diagnosis was made One case was treated for over one year for various conditions, the pelvic pain being finally ascribed to a floating kidney One case was treated over a long period by the application of gold leaf Two cases had prolonged courses of local treatments, one of these being referred to a hospital for curettment, without the local condition being recognized Another case of five years' standing with text-book symptoms, I was asked to see as an acute appendix On the other hand, this experience has been offset by cases, without manifest evidence of the disease, recognized early as a result of a careful examination by the physician Delay on the part of the public has been even more apparent, the majority of cases having presented signs demanding medical advice for from three to six months before doing so

Several cases gave histories of having had difficult or instrumental labors and one case followed child-birth immediately In several cases uterine lesions, possibly precancerous, had been recognized and their correction advised but not accomplished In one case the cervix had been amputated 12 years before and in another 18 months before One case of very short duration was admitted with recent symptoms suggesting a ruptured pelvic abscess Forty-seven of the cases resided in Syracuse or its suburbs, while thirty-three cases came from elsewhere

Of the cases (26) treated during the first year, 12 had no operation Of these one is living, three years and eight months afterwards, one died four years and three months later of broncho-pneumonia, free from any evidence of cancer

Ten died as follows

One case under two months

One case between two and four months

Two cases between four and six months

Two cases between six and eight months

One case between eight and ten months

Two cases between ten and twelve months

One case, date of death unknown

Three cases showed a complete clinical cure after radium and were later operated

One is living, four years and five months afterwards

One died three years and seven months afterwards

One died—date of death unknown—lived about two years

Eleven cases were treated post-operatively Of these

Five cases are known to be dead, but exact date of death unknown.

One case, not known whether living or dead

Three cases died under 8 months

One case died under 18 months

One case living 3 years and 10 months after radium was used for a vaginal recurrence, or 5 years after the original operation

Seven cases had one treatment

Eight cases had two treatments

Six cases had three treatments

Two cases had four treatments

One case has had five treatments

One case has had six treatments

One case has had seven treatments

Of the cases living over 3 years, of which there were five (one of which died of pneumonia and one of a recurrence)

Two cases had one treatment

Two cases had two treatments

One case had five treatments (due to vaginal metastasis)

Of the cases treated during the second year (22) 18 had no operation

Two cases are living, both over 2 years and 8 months afterwards

Sixteen cases are dead, as follows

One case, date of death unknown

One case died under two months

One case died between two and four months

Three cases died between four and six months

Five cases died between six and eight months

One case died between eight and ten months

Three cases died between twelve and eighteen months

One case died between twenty-four and thirty months

One early case was treated six weeks before operation and showed a complete clinical cure at that time This patient is now living, three years afterwards

Three cases were treated post-operatively

One living two years and ten months after radium treatment, or three years, two months after operation (recurrence)

One died between eight and ten months

One died between ten and twelve months

Eight cases had one treatment

Nine cases had two treatments

Three cases had three treatments

Two cases had four treatments

Of the cases living over two and a half years

Two cases had no operation

One case was treated before operation

One case was treated after operation

Two of these cases had one treatment, one case had three treatments, and one case had four treatments (vaginal metastasis)

Fifteen cases were treated during the third year

Thirteen cases had no operation

Five cases now living eighteen to thirty months afterwards

Eight cases dead, as follows

One case, date of death not known

One case died under two months

One case died between four and six months

Two cases died between six and eight months

One case died between twelve and eighteen months

Two cases died between eighteen and twenty-four months

Two cases were treated post-operatively

One case died, date of death unknown

One case treated shortly after operation, living one year and nine months afterwards

Seven of these cases had one treatment

Five cases had two treatments

Two cases had three treatments

One case had seven treatments (six treatments at another clinic in the West, from which patient was referred)

Of the six cases living over eighteen months (five without operation, and one post-operative)

Three cases had one treatment

Two cases had two treatments

One case had three treatments

Of the eight cases treated during the fourth year

Four had no operation, all living nearly one year, but two show advancing recurrence

One case was operated after a clinical cure followed radium, and has formed both vesical and vaginal fistulae

Three cases, all recurrent, were treated post-operatively

One case living

One case living, but disease has advanced

One case died, two months after recurrence, six years after operation

Four of these cases had one treatment.

Four of these cases had two treatments

During the present year, nine cases have been treated, four without operation, all living, and five following a previous curettment and cauter operation. Eight of these cases had one treatment and one case had three treatments

Fistulae have formed in eight cases (10%)

Fistulae formed in two cases in which there was no operation 4.0% (2.5%), and in six cases which were operated 20.7% (7.5%)

Five cases during the entire series were operated, following a complete clinical cure, the result of radium

One case is living, four years and five months afterwards

One case is living, three years afterwards

One case is living, one year afterwards, but with recurrence

One case died of recurrence, three years and seven months afterwards

One case died of recurrence, date of death unknown

Fourteen cases had a hysterectomy prior to radium treatment, of which twelve presented metastasis at the time of the radium treatment. Seven of these cases have died, one is in a very advanced condition, three are living and condition of one is unknown. These patients presented themselves for treatment in periods of from six months to six years after operation

Of the two cases without metastasis, one died over four years after operation, and one is living two years after operation

The average age of the cases living over three years is 53 years, and of cases living over two years is 51 years, ranging from 39 to 68 years

The average number of treatments of cases living over three years was 2.2, and of cases living over two years was 2.27

Fifty cases have died, as follows

Ten cases, date of death unknown

Four cases died under two months afterwards

Two cases died between two and four months afterwards

Six cases died between four and six months afterwards

Twelve cases died between six and eight months afterwards

Three cases died between eight and ten months afterwards

Three cases died between ten and twelve months afterwards

Five cases died between twelve and eighteen months afterwards

Two cases died between eighteen and twenty-four months afterwards

One case died between twenty-four and thirty months afterwards

One case died between forty-two and forty-eight months afterwards

One case died over forty-eight months afterwards of pneumonia

Twenty-nine cases are living

Two cases, two months after treatment

Two cases, between two and four months after treatment

Four cases, between four and six months after treatment

One case, between six and eight months after treatment

Four cases, between ten and twelve months after treatment

Three cases, between twelve and eighteen months after treatment.

Five cases, between eighteen and twenty-four months after treatment

One case, between twenty-four and thirty months after treatment

Four cases, between thirty and thirty-six months after treatment

Two cases, between forty-two and forty-eight months after treatment

One case, over forty-eight months after treatment

The outcome of one case is not known

#### CANCER OF FUNDUS UTERI

Of the eleven cases of cancer of the fundus, ten patients were married and one single. The average age was 60.4 years. The youngest case was 48 and the oldest 77 years. Six cases were from Syracuse and five from out of the city.

Delay, from the standpoint of the physician was evident in four cases, two of which had received several X-ray treatments for supposed fibroids without diagnostic curtailment.

Two of these cases, from the history, were thought to be hemorrhage cases, the preliminary curettment proving otherwise.

Five of these cases were treated during the second year.

Two of these cases were treated during the third year.

One of these cases was treated during the fourth year.

Three of these cases were treated during the fifth year.

Six cases received one treatment.

Two cases received two treatments.

One case received three treatments.

Two cases received four treatments.

Three of these cases died.

One lived eleven months (post-operative).

One lived four months (treated over long period with X-ray for fibroid).

One lived seventeen days (post-operative).

Seven cases are living.

One case, three years and one month afterwards (no operation).

One case, two years and eleven months afterwards (no operation).

One case, two years and eleven months afterwards (later operated).

One case, one year and ten months afterwards (no operation).

Four cases, treated within last eight months.

#### CANCER OF OVARY

Six cases, five patients married, one patient single (sarcoma), average age, 54.2 years.

Three patients operated.

One died eleven months afterwards.

One died five months afterwards.

One living one year afterwards—condition advancing metastases.

Three patients not operated.

Two died within one year.

One case living over one year—diagnosis is questionable.

#### CANCER OF THE VULVA

The thirteen cases of cancer of the vulva were all in married women. The average age was 67 years. The youngest patient was 48 and the oldest 86 years. Three patients were over 80 years of age. Four of the cases were of a papillary type, their average age being 57 years (10 years below the average age for the entire group).

Four cases had been operated previously, all of which had recurrences within six months, except one, age 55, of twelve years duration, with three previous operations. This was a case of the papillary type.

All of the cases with two exceptions are known to have died in from three months to one year and nine months after the initial radium treatment. One case, whose present condition is unknown, showed complete local healing for over one year. One case is living, one year later, with recurrence.

#### CANCER OF THE BLADDER AND URETHRA

The average age of three cases of cancer of the bladder was 67 years. Two of these cases died within a short period, and one case recently treated is living, unimproved. Two of these cases were treated by radium, applied through the urethra, and cross-firing through the vagina, and one case through a supra-pubic wound.

The average age of four cases of cancer of the urethra was 66 years. Only two of these cases were diagnosed by histological examination. In the other two cases the diagnosis was made by endoscopic examination by the urologist and, therefore, not definite. Two cases are dead, one case is living with a recurrence after nearly a year of control, and one case, which was completely controlled is living. No evidence of growth at present time.

#### FIBROIDS

Of the nineteen cases of fibroids.

Five were treated during the first year.

Four were treated during the second year.

Five were treated during the third year.

Two were treated during the fourth year.

Three were treated during the fifth year.

The average age was 46 years, ranging from 35 to 54 years, although one case, not a good operative risk, age 30, was given a treatment preliminary to removal.

Sixteen cases were married women. Three cases were single women.

The treatment was repeated in only three cases.

All obtained relief except as follows.

One case, age 30, not a good operative risk,

mentioned above, who later had a hysterectomy done

One case, with a very large tumor, extremely anemic and inoperable. Later, after improvement in general condition, a hysterectomy was done, and a fibroid uterus, associated with a sarcome was removed

Two cases died shortly after radium treatment, both being entirely unsuited for operation, one a patient with advanced arterio-sclerosis and nephritis, who had a progressive anemia of long standing, due to hemorrhage, unrelieved by repeated curettments and X-ray, the other a very large fibroid with marked anemia uncontrolled by X-ray treatments. In this case a large fibroid had been removed ten years before. Although there was no autopsy, the probability of sarcoma must be considered

One case cured now three years had a fibroid in the posterior half of the cervix which recurred twice within two years. The microscopical diagnosis in this case was malignant leiomyoma

#### HEMORRHAGE OF MENOPAUSE

Hemorrhage of the menopause and allied condition occurred in twenty-eight cases, as follows

No cases during first year

Eight cases during the second year

Four cases during the third year

Eight cases during the fourth year

Eight cases during the fifth year

Twenty-two cases were married women. Six cases were single

One patient was 22 years of age and two were 25 years of age. In two of these cases both tubes and one ovary had been previously removed. The other patient had a polyp. These cases were treated with 25 milligrams of radium for a period of four to eight hours. All showed a restoration of normal menstruation

The average age of the other twenty-five cases was 43.2 years, ranging from 35 years to 56 years

The pathological conditions encountered were glandular hyperplasia, hypertrophic endometritis and polyp

All cases were adequately controlled with one treatment

Two of the cases had been curetted once, two twice, and one case three times without relief. Several cases had had many X-ray treatments

#### CONCLUSIONS

With 15% of our first year cases of cancer of the cervix living nearly four years, 18% of the series of the second year living nearly three and one-half years, and 40% of the series of the third year living nearly two years or over, and considering that all of these cases, with one exception, were definitely inoperable and many of the cases far advanced, it would seem that there should be no doubt in the opinion of the surgeon as to the operability of a case of cancer of the cervix before performing a pan-hysterectomy on

such cases. Our experience indicates that it is as unsafe as it is unwise to operate a borderline case, relying upon radium to control recurrences. It must be borne in mind that when a hysterectomy has been performed, the chances of using radium in adequate dosage have been greatly decreased, and that the chances of the formation of fistulae have been greatly increased. In view of the fact that many fairly well advanced cases are now perfectly well over a period of two, three and four years, an initial radium treatment should not be refused any case, unless markedly advanced. Our experience would indicate that very little if anything is accomplished by operating a case which has shown complete clinical cure after radium has been used. Possibly harm may be done by such procedure. Cases that have been operated should receive post-operative radium treatment as soon as seems safe after hysterectomy, and not wait for recurrence. Smaller dosage is indicated in such cases. Reliance should be placed upon the first radium treatment. The chances for cure seem to decrease with the number of treatments necessary. We have abandoned the repetition of treatments at stated intervals, only repeating the treatment when conditions would indicate. At the time of the first treatment, the patient should be prepared as for operation, anesthetized, most carefully examined, the uterine cavity explored if this seems indicated, the cervix entirely curetted of all diseased tissue and the radium applied with great care as to its position. We are not convinced that the use of needles introduced into the tissue of the cervix has improved our results. These cases should be examined at intervals of from three to six weeks for a period of six months, after which they should be examined at longer periods. These examinations should be made with the patient in the knee chest position, as a recurrence in the vaginal vault becomes more apparent in this way.

While we are not ready to abandon our position advocating hysterectomy in all except advanced cases of carcinoma of the fundus, still the highly satisfactory results accomplished with radium in three of our eleven cases would urge us to have the surgeon bear definitely in mind the possible good results to be obtained by this method in such cases presenting undue surgical hazards, such as the very old, the extremely obese patient, or those presenting constitutional conditions which represent surgical contraindications.

Except for the control of vaginal metastasis with the consequent checking of hemorrhage and discharge, radium offers no relief to the patient with cancer of the ovary, in our experience. Early exploratory operation seems to us justifiable on the grounds that the diagnosis may not be correct.

Despite the unfavorable results from surgical

treatment of cancer of the vulva, we feel that radium has nothing further to offer in this condition. In considering the end results, undoubtedly the patient obtains greater relief by the surgical removal of the growth than by its destruction, if possible, by radium. While we have had fairly satisfactory results in one case, it is quite possible that the same result would have been accomplished by surgery, and perhaps in a shorter time. We, therefore, feel that radium is only advisable in cases where surgery is absolutely contraindicated. On the other hand, it would seem well to teach the profession that such growths cannot be removed by a small operation under local anesthesia, but demand a radical, wide excision.

Radium has been used without relief in our cases of cancer of the bladder. We would feel that the only cases of this condition offering any hope are those occasional ones of a papillary type which are well localized and which can be excised, after which radium may be applied through the suprapubic wound.

Although it is doubtful if any of our cases of epitheloma of the urethra are being absolutely cured, radium here offers a more satisfactory way of destroying the growth than surgical removal.

Our experience in the use of radium in the treatment of fibroids confirms indications laid down by Dr. John G. Clark and his associates several years ago, and we feel that radium should only be applied in cases near the menopause with the tumor not larger than a three months' preg-

nancy, in which bleeding is the leading symptom, and pain bilateral to the uterus is absent. In such cases our results have been highly satisfactory. Not only are the results in larger tumors unsatisfactory, but our experience would indicate, possibly dangerous. These tumors in our experience are not only resistant to radium treatment, but usually complicated by other growths or lesions demanding surgical treatment. Nevertheless, such cases when inoperable because of the anemia resulting from uncontrolled hemorrhage may be made operable as the result of a radium treatment, which, however, should be used most cautiously.

Our results in the use of radium in the treatment of cases of hemorrhage of the menopause and allied conditions not due to cancer or large fibroids, has been most highly satisfactory. We have failed to have a case which has not been successfully controlled by one treatment and feel that radium should be looked upon as a treatment par excellence in this condition.

Our experience would indicate that radium in the treatment of suitable gynecological conditions is becoming more definitely established, that its indications and contraindications are better recognized and the results from its use gradually improving. It is felt that as a result of the acquiring of this knowledge by the profession and the improvement in the technique and the use of radium, not only will we improve our results in the treatment of benign conditions, but that the aspect of such hopeless conditions as cancer of the cervix will become much brighter.

## SOME NEGLECTED PHASES OF COMA IN DIABETES MELLITUS\*†

By WILLIAM S. McCANN, M.D.,

ROCHESTER, N. Y.

COMA in diabetes has become so intimately associated in our minds with acidosis that when one sees an unconscious patient with diabetes the treatment of acidosis is automatically thought of. So much emphasis has been laid on the use of insulin in diabetic coma in recent months that this is a timely occasion on which to recall that coma in diabetes is not always associated with or due to acidosis or intoxication with the acetone bodies.

Coma may occur in diabetes from the same causes which operate in non-diabetic individuals. A study of a large series of cases has revealed the truth and importance of this statement. It is particularly important to bear in mind the possibilities of cerebral vascular accidents and of uremic coma in individuals

with diabetes. One unfortunate case was seen recently in which a cerebral accident had occurred, the resulting coma being mistakenly attributed to diabetes. When insulin was given marked hypoglycemia resulted which did not respond to glucose injections, and death occurred. Death may have been due to the vascular accident, but it is not pleasant to think that the hypoglycemia may have been a heavily contributing factor.

The occurrence of uremia in diabetes presents a condition which is very difficult to analyze. As you know, uremia is usually associated with an acidosis, and in diabetic coma due to ketosis there is usually a considerable disturbance of renal function. The evaluation of such cases calls for all the refinements of clinical analysis.

There are two forms of coma in diabetes which are peculiar to the disease. The com-

\* Read at the Annual Meeting of the Medical Society of the State of New York at Rochester, April 23, 1924.

† From the Medical Clinic of the Johns Hopkins Hospital, Baltimore.

mon form is due to ketosis and acidosis. A much more rare form is that due to spontaneous hypoglycemia. It is probable that coma from induced hypoglycemia will be frequently encountered during the widespread use of insulin.

In March, 1921, a patient with severe diabetes of two years' duration, entered the service of Dr. E. F. DuBois in Bellevue Hospital, where he was seen and studied by the writer. He had been under the care of Dr. Joslin, and later of Dr. Allen. The weight was about half of its normal value. Five days were required to render the urine sugar-free and the blood sugar normal by fasting. During the succeeding three days the diet was built up slowly, considerable amounts of bran biscuits being used. Diarrhea developed. On the following day the blood sugar was 0.08 per cent. About 11 a. m. the patient became drowsy and later semiconscious. The urine contained neither sugar nor acetone. After stimulation he roused and took food and passed the night well. On the morning of the next day the blood sugar percentage was 0.06 per cent. The patient became stuporous about 9 a. m., respirations were slow, pupils small but reacted to light. There was no odor of acetone nor glycosuria, nor acetonuria. A stool was passed involuntarily. The patient did not respond either to stimulation or to hypodermoclysis and Murphy drip, in both of which glucose was given. Death occurred.

This case was reported to Dr. Joslin, who replied that he had witnessed three cases of spontaneous hypoglycemia, one of the patients recovering and subsequently developing a high carbohydrate tolerance. These cases were reported subsequently by Joslin.

The next opportunity to witness this interesting phenomenon occurred at Johns Hopkins Hospital. A man of 46 years, who had had diabetes for six years, entered the hospital because of an intractable diarrhea of four months' duration. For four years he had been greatly undernourished, with frequent days of starvation. At the time of admission he weighed only eighty-seven pounds, less than half his normal weight. On examination, nothing of great importance was found, other than extreme emaciation and moderate peripheral arteriosclerosis. The stools were very bulky, containing undigested food. The patient's blood sugar ranged from 0.054 to 0.286 per cent on a constant diet. The days of low sugar occurred with exacerbations of the diarrhea. The  $\text{CO}_2$  combining power was normal at all times, there was no acetonuria, and no glycosuria when the hypoglycemia occurred. The hypoglycemia of 0.054 per cent was not associated with any unusual symptoms.

On the day of the patient's death he was feeling quite as usual up to 4 p. m. At 4:30 he was unconscious with shallow respirations and weak pulse. At 8 o'clock the blood sugar was found to be less than 0.02 per cent, non-protein nitrogen 0.27 per cent, and  $\text{CO}_2$  C. P. 64 vol per cent. Stimulants were given without effect. Glucose was given intravenously. The patient died two hours later.

Autopsy showed extreme atrophy of the pancreas, very early lobular pneumonia with fibrinous pleurisy.

These cases serve very well to illustrate a type of true diabetic coma about which very little has been said. The occurrence of spontaneous hypoglycemia though rare, is sufficiently common so that one should always be on the alert to detect it while there is still time to prevent collapse by the administration of glucose.

A neglected phase of the subject of diabetic acidosis concerns the renal function. Before taking it up it would be well to consider the behavior of the kidneys during acid excretion. It has been known for a long time that the excretion of an increased amount of acid in the urine usually results in a change in the nitrogen partition of the urine, that is, the proportion of the nitrogen excreted as ammonia increases. In 1915 Palmer and Henderson<sup>(3)</sup> published an interesting study of the ratio of urinary ammonia to acid excretion in normal individuals and in patients with nephritis. Comparing their figures for patients with advanced nephritis and renal acidosis with those of normal subjects one finds that the urine of the former was more acid and gave a higher titratable acidity and that the amount of ammonia excreted was relatively much less than in the case of normals. The full significance of these findings was not appreciated at the time and the interest in renal acidosis was directed toward the evidence of acid retention developed by Marriot and Howland<sup>(3)</sup>, Denis and Minot<sup>(4)</sup> and Greenwald<sup>(5)</sup>. It was not until Nash and Benedict<sup>(6)</sup> had brought forward convincing evidence that the kidney is the site of formation of the urinary ammonia that a completely satisfactory explanation for renal acidosis was available. In the light of this knowledge it seems probable that two factors, acid retention and reduced ability to form ammonia, play a part in the production of renal acidosis.

In diabetic ketosis rapid compensation for the over-production of acids is effected by means of the respiration and circulation. Hyperpnea and a more rapid rate of blood flow make up for the diminished capacity of the blood for carrying carbonic acid. Some volatile ketones are eliminated through the lung.

In this manner the hydrogen-ion concentration of the blood may be kept normal for a time in spite of a considerable acid production

While the lungs regulate the reaction of the blood, the maintenance of the alkaline reserve is to a large extent dependent upon the kidneys. In diabetic ketosis the kidneys must eliminate not only the normal acid products of metabolism but an excessive amount of organic acids, chiefly derived from fats. In so far as the kidney fails to eliminate them they remain in combination with the bases of the blood diminishing the alkaline reserve. Unfortunately the excretion of acid cannot be accomplished without the simultaneous excretion of some base. Apparently the kidney cannot secrete urine with a hydrogen ion concentration greater than pH 4.8. At this pH most of the inorganic acidity is due to acid phosphate in which one mol of phosphoric acid is combined with one mol of base. By excreting acid phosphate some base is spared to the blood. The organic acids, which are weakly dissociated might conceivably be excreted to a certain extent free. Beyond a certain point, however, the excretion of these acids would require base in the urine. In so far as the kidney supplies base in the form of  $\text{NH}_3$ , the bases of the blood are conserved for the maintenance of the alkaline reserve. In so far as the kidney fails to furnish base as  $\text{NH}_3$ , the alkaline reserve may be depleted, provided no alkali gains entrance with the ingesta. It appears, therefore, that the kidney plays a major role in determining the outcome of severe diabetic ketosis. It is of the highest importance that all factors which may affect renal function be taken into consideration in the management of such cases.

In true diabetic acidosis there are several factors which may have a profound effect upon renal function. A review of the fatal cases of diabetic coma in the medical clinic of the Johns Hopkins Hospital showed that practically all had albuminuria and cylindruria. In some cases there was hematuria as well, with a true acute nephritis at autopsy. In other cases no nephritis was found at autopsy in spite of markedly abnormal urinary findings. The rest nitrogen of the blood is usually increased. Almost invariably patients with profound diabetic acidosis had an oliguria. There are two things occurring regularly in these cases which may account for the urinary abnormalities and evidences of renal insufficiency. These are marked dehydration and vascular hypotension. Marriot<sup>(7)</sup> has observed marked albuminuria and cylindruria in the state of anhydremia in infants.

The evidence of dehydration in diabetic coma is usually quite well marked. Low

ocular tension is one of the best indices of desiccation. The eyeball frequently feels like an over-ripe grape. The tension of the eye becomes more normal with the administration of large amounts of fluid. Low blood pressure is also usually found in these cases. Some have thought that the low ocular tension may be dependent upon the low blood pressure rather than upon the dehydration per se. Whether that is true or not, both the blood pressure and ocular tension rise when fluids are given abundantly. The red cell count and hemoglobin of these patients are almost always lower after the administration of fluids than before the institution of treatment, showing that there was probably a considerable concentration of the blood.

The effect of dehydration and of the low blood pressure on kidney function is very considerable. With the marked oliguria usually observed a considerable acid retention occurs and a nitrogen retention as well. There is also evidence that dehydration affects the ammonia forming function adversely.

It must also be borne in mind that the circumstances under which coma in diabetes is apt to arise are very frequently such that an acute nephritis or an acute exacerbation of a chronic nephritis is set up. This is especially true when coma follows an infection, furunculosis, carbuncles, tonsillitis, sinus and middle ear infections, and with diabetic gangrene. Investigations are now in progress to determine to what extent various forms of kidney disease affect the functions of acid excretion and ammonia formation. So far as these studies have gone the evidence indicates that even in mild nephritis the ammonia function may be impaired. While it may be sufficient to preserve the alkaline reserve during the excretion of normal acid metabolites it may not be able to maintain the alkaline reserve during periods of abnormal acid excretion such as occur in diabetes.

Much further study is necessary to determine what factors chiefly impair the ammonia-forming function of the kidney. The problem is at present under investigation in the clinic in Baltimore, and a more detailed report will have to be postponed. In the following table of data from a case of severe diabetic coma the gross relationship to the alkaline reserve of fluctuations in the  $\text{NH}_3$  acid ratio is very well illustrated.

Reference to Table 1 shows very clearly that when the ratio of ammonia to total acid excreted was low a decrease in alkaline reserve occurred and vice versa. These observations illustrate an important phase of the relationship of kidney function, especially of the ammonia forming function, to the alkaline reserve of the blood.

TABLE I—ELIZABETH S

The points which in our experience are most frequently neglected in management of coma in diabetes, are as follows

1 Exclusion of causes of coma other than ketosis, such as spontaneous hypoglycemia, uremia, cerebral vascular accidents, etc. There are two distinct forms of true diabetic coma, one commonly recognized in association with acidosis, and the other form not associated with acidosis but with hypoglycemia occurring suddenly and spontaneously

2 Attention to kidney function, especially direction of efforts to combat dehydration and to improve circulation by copious administration of fluids, by vein, subcutaneously and by Murphy drip, and the use of digitalis

These are the measures which are instituted first in the Medical Clinic at Johns Hopkins. Insulin is given at frequent intervals, usually every two hours, so that the patient receives 10-12 units per hour until the hyperglycemia is reduced. It is customary to add glucose to

the physiological saline solution given by vein or by Murphy drip, so that the patient receives 6-8 grams of glucose per hour. As soon as the patient recovers sufficiently to take food by mouth, fluids are administered copiously by that route, a maintenance diet is given in liquid form, consisting of orange juice, cream, and lactose, and occasionally glycerine, made up in the proportions of Woodyatt's formula (8) (9)

## OBSERVATIONS OF 101 CASES OF NASAL INFECTION, EXCLUSIVE OF DIPHTHERIA, IN CHILDREN \*

By WILLIAM A. KRIEGER, M.D., F.A.C.S.

POUGHKEEPSIE, N. Y.

IN presenting this subject to the pediatric section, it is my desire to review briefly the anatomy of the paranasal sinuses and the lymphatic supply to these parts, to emphasize a few points, which can be easily recognized by the men not doing special nose and throat work, and to present a few cases, which have occurred in my private practice, illustrating these points

According to Schaeffer the maxillary sinus is evident about the seventieth day of fetal life. After the fifteenth year, it may be considered as the adult stage

One must also bear in mind that the frontal sinus is genetically and topographically ethmoidal before it is frontal and in this sense is conspicuously present at birth in all cases. As a rule, one cannot be certain of the actual frontal sinus

until the sixth to the twelfth month of postfetal life.

The sphenoidal sinus is genetically demonstrable as early as the fourth month of fetal life. However, by the end of the third year the rudiment of the sphenoidal sinus is surrounded by bone save ventrally toward the nasal fossa where an opening, the primitive ostium sphenoidale, exists. During the fourth year it becomes the primitive sphenoidal sinus. The dorsolateral aspect of the sphenoidal sinus may thus early come into intimate relationship with the ophthalmic and maxillary nerves and be a potent factor in childhood neuralgias of the trigeminal nerve, even as early as the third year. Moreover, the pterygoid (Vidian) canal with its contained nerves and vessels likewise early—sixth or seventh years—establish close relationship with the developing sphenoidal sinus. It is obvious

\* Read at the Annual Meeting of the Medical Society of the State of New York at Rochester, April 23 1924

that the sphenoidal sinus is early of importance clinically and that by the second or third year has assumed proportions sufficiently large to become the seat of pathologic processes and to retain infectious material in its cavity

The initial ethmoidal out-pouchings are in evidence as early as the fourth month of fetal life, by the seventh month the evaginations have taken shape in the form of hollow tubular-like, blindly ending sacs, with ostia in communication with the points of initial outgrowth. These tubular sacs may be truly said to be ethmoidal cells.

Conforming with the double function of the nasal cavity proper there are two areas of the lining mucous membrane that differ in structure—the *pars respiratoria* and the *pars olfactoria*. In this paper, I shall deal more particularly with the former—the *pars respiratoria* or respiratory portion. The stratiform flat epithelium of the nasal vestibule gradually assumes the characteristics of the respiratory mucous membrane, e.g., a stratiform ciliated cylindrical epithelium. The nasal respiratory mucous membrane varies greatly in thickness in the several parts of the nasal fossa. Over the inferior concha, portions of the middle concha, and the adjacent portions of the septum, the membrane frequently reaches a thickness of several millimeters, elsewhere it may be considerably less than a millimeter. The respiratory mucous membrane readily thickens under pathologic conditions, often obtaining a thickness of from four to six times normal. One of the characteristics of the nasal respiratory mucous membrane is the extremely rich blood supply of the *tunica propria*. The arteries of the deeper strata send their branches through the *propria* to form a capillary network beneath the epithelium and around the neighboring glands. From the arterial network the blood flows into a superficial venous plexus, thence to a deeper one. Careful study indicates that these venous plexuses or blood sinuses assume the character and role of an erectile tissue—the *plexus cavernosi concharum*. Nerve reflexes control the filling and emptying of the cavernous tissue. It is well known that certain stimuli through the reflexes rapidly deplete the thickness of an engorged mucosa and that in certain psychic states similar depletion is experienced, and *vica versa*. The great masses of blood are doubtless of great importance in warming the inspired air. This, indeed, may be the chief function of the erectile tissue. Of course, a possible phylogenetic relationship must be kept in mind. Numerous glands are found in the *tunica propria* of the respiratory mucous membrane.

The paranasal (accessory) sinuses are lined by mucous membrane directly continuous with that of the nasal fossa, including the maxillary, the frontal and the sphenoidal sinuses, and the

ethmoid labyrinth. The mucous membrane lining the several paranasal sinuses and cells resembles that of the nasal fossa, save that it is much thinner and contains fewer glands. Moreover, it does not assume the characteristics of an erectile tissue. In spite of the extreme delicacy and thinness of the mucous membrane of the paranasal sinuses and its firm adherence to the *perosteum*, it is readily influenced and greatly thickened by pathologic processes. It is particularly prone to thickening, rapidly so in the vicinity of the ostia of the maxillary and sphenoidal sinuses owing to the greater looseness of the structures at these points.

The lymphatics of the nasal cavity ramify the entire *muco perosteum*, both olfactory and respiratory, including that of the septum. It has also been fairly well established that the lymphatic network extends into the paranasal sinuses in communication with the nasal cavity. The lymphatic vessels are located in the connective tissue of the *tunica propria* and their richness is in direct proportion to the thickness of the mucosa. At places the mucosa is infiltrated with lymphatics and occasionally very minute solitary nodules are found. In man the main collecting vessels of the lymphatic network of the nasal fossae form ventral and dorsal groups. The lymphatic network in the region ventral and caudal to the pharyngeal ostium of the auditive tube receives drainage from a considerable portion of the nasal fossa. From this region go forth the largest and most important collecting trunks from the lymphatic network, to terminate in either the deep cervical chain or in the retropharyngeal nodes. It has been shown by Most that at whatever point the nasal mucosa is punctured, the retropharyngeal nodes are colored by the injected material. Sappey long since pointed out the involvement of the large lateral retropharyngeal nodes ventral to the atlas in diseases of both the nose and the pharynx. The frequent infection of the retropharyngeal nodes is readily explained when one recalls their extensive lymphatic area. They receive as afferents almost all the collecting vessels from the nasal mucous membrane and from the cavities in connection with the nasal fossae. Moreover, afferents from the lymphatic network of the cavity of the tympanum, the auditive tube, and the nasopharynx pass to these regional nodes.

Flexner, in discussing the mode of infection in epidemic meningitis, states that in all probability the micro-organism passes directly to the nervous system by way of the lymphatic connections between the naso-pharyngeal mucosa and the meninges.

There is little definite knowledge of the lymphatics of the accessory sinuses of the nose. Studies of Most indicate that the lymphatic drainage from all the paranasal sinuses and cells is

into the retropharyngeal nodes. Clinical evidence bears out this conclusion.

With the knowledge we have of the nasal mucous membrane, the lymphatic supply, their relation to the paranasal sinuses and the early development of the same, the question of nasal infection in children becomes paramount. Every internist and pediatrician should familiarize himself with the use of the head mirror and the nasal speculum, in order to differentiate the normal from the pathologic nose. Take, for example, the ordinary clinic. Much time is spent in child hygiene, careful attention is given to weight, minute directions are provided as to diet, the tongue depressor is in constant use, but in few—very few—will you find a routine examination of the nose. If a child has any difficulty whatsoever in breathing, it is immediately marked for tonsillectomy and adenoidectomy, regardless of any infection that may be in the nose or paranasal sinuses. This is particularly noticeable in the examinations given by welfare workers. Contrary to the belief of some, I refuse to operate on these cases until I have been able to rid them of nasal infection. I believe that lung complications, such as pneumonia and pulmonary abscess, are due to the aspiration of infectious material from the nose. It is my habit not to do tonsil and adenoid operations on children from December first to April first because almost everyone in my locality, during these months is either carrying or is constantly exposed to nose and throat infections. I believe, from my own experience and from the opinion of others, that such conditions as scarlet fever, measles and whooping cough are primarily nose and throat infections and that, if treated as such many complications would be avoided and epidemics of contagious diseases very markedly reduced. Many of these cases may be considered latent sinus infection. With cleansing and aeration of the nose, the infection subsides and the sinuses return to a normal condition. While I do not in any way discredit the T & A operation when necessary, I have yet to be convinced that such an operation clears up the nasal infection, excellent authorities to the contrary notwithstanding. However, I have often observed tonsils and adenoids diminish in size and inflammation by clearing up the nasal or paranasal sinus infection. I have repeatedly seen children advised for T & A operation, who on palpation of the pharynx had no adenoid tissue present, but did have very definite nasal infection. Breathing and general health improved under careful nasal hygiene. My personal experience therefore leads me to believe that cervical adenitis and pharyngitis are never primary, but are the sign posts pointing the way to the seat of the real condition. By referring to the lymphatic supply and the natural drainage of the nose and the paranasal sinuses, it seems to me that the saying "catarrhal con-

ditions associated with adenoids" should be "adenoids or lymphatic hypertrophy associated with nasal infections." I feel it extremely important to listen to the parents' description of the child's symptoms and actions. Frequently a child will describe its headaches almost to the letter as Sluder describes them in his book, "Headaches and Eye Disorders of Nasal Origin." The nose seems to be the last thing to be considered. I have seen glasses prescribed many times for children when headaches and diminished vision were caused by nasal infection.

A child whose general physical examination is negative and has a history of one or more prominent symptoms, such as fever, loss of appetite, irritability, cough, enlarged glands, etc. deserves a careful nasal examination.

To illustrate some of these conditions, I shall recite a few cases representative in my series.

1 Cough as the prominent symptom, 21 cases, age ranging from two to ten years, all of which recovered under nasal treatment.

Case No 1 H. L. C., age two years. Cough resembling whooping cough, so markedly that the cough was accompanied by vomiting. History of two weeks duration. No other symptoms. Culture showed staphylococcus as predominating organism. After the first thorough cleansing of the nose and suction the vomiting ceased and within a week the cough had entirely disappeared. This child was under observation for three weeks, with no return of the cough. Has not been operated for tonsils and adenoids.

Case No 2 R. D. P., age 6 years. Cough and difficult breathing from birth. T & A operation at eighteen months. Cough and difficult breathing still present. First seen by me January 1924 both nostrils showed a great deal of muco-purulent discharge, and on examination of the throat a large mass of muco-pus could be seen coming down from the naso-pharynx. The sinuses on transillumination were clear. Culture showed staphylococcus as the predominating organism. The cough and difficult breathing subsided promptly under treatment, but it took several months to obtain what might be called a fairly healthy nose.

2 Temperature as prominent symptom 38 cases ranging in age from six weeks to ten years. All recovered under nasal treatment.

Case No 1 B. A. E., age six weeks. History of "sniffles" for about two weeks. December, 1923, temperature 104° physical examination negative, referred to me for examination, ears being suspected. On examination ears were negative, throat negative, left nostril negative. The right nostril in the region of the middle fossa, contained a small amount of pus. This was cultured and showed staphylococcus. Suction was applied with a very noticeable drop in temperature. This was continued several days in succession, with a resultant normal temperature. Treat-

ment was discontinued for three days and then a recurrence was noticed, treatment by suction was again instituted and the child observed with occasional treatment for a month, with no recurrence to date

Case No 2 F M R, age seven months This case had been treated for "teething" for four days Dr Card was called to see this child and found physical examination negative Temperature 105° Considerable nasal discharge and dyspnoea He immediately referred this case to me Examination showed the ears negative, with a great deal of muco-pus in both nostrils and throat Culture of the nose showed staphylococcus Suction was applied to the nose daily for three days, with a constant decline of the temperature to normal Dyspnoea disappeared almost immediately, absent after the second treatment This child had completely recovered within a week

3 Enlarged cervical glands as the prominent symptom 18 cases, ranging in age from one to seven years, all of which improved and returned to normal under nasal treatment.

Case No 1 R. A., age fourteen months Examination showed marked enlargement of both anterior and posterior chain, bilateral Tonsils large, almost obstructing the view of the pharynx Muco-pus could be seen on the posterior pharyngeal wall, and both nostrils were almost blocked with muco-pus This child had no elevation of temperature Culture was taken and report showed no K L present Under nasal treatment, glands returned to normal, tonsils reduced in size, so that pharynx could be readily seen, nasal fossae became clear within a month

Case No 2 C D, age sixteen months This case is almost identical with Case No 1, except that it took about three months for the glands to disappear entirely, although the nose and throat cleared promptly

4 Malnutrition prominent symptom, 9 cases, age ranging from six months to nine years All showed improvement under nasal treatment

Case No 1 J W, age seven years This was an undernourished child with an acute otitis media which went on to mastoid involvement and was operated Had been operated for T & A three years before No adenoids present, but many lymphoid follicles in the posterior pharyngeal wall There were large tonsil remains Cultures of the mastoid wound and nose showed pneumococcus and streptococcus On recovery from the mastoid operation, the tonsil remains were removed This child has been kept under observation and nasal treatment all winter and is gaining rapidly in weight and is returning to a quite normal condition

Case No 2 F M, age six months When I first saw this child, she had a bilateral acute purulent otitis media of about ten days duration, both nostrils filled with muco-purulent discharge

which showed staphylococcus and pneumococcus This child presented the appearance of marasmus Under ear and nasal treatment the acute otitis recovered, as did the nasal condition and the general physical condition of the child is rapidly improving

5 Those with eye symptoms predominating, 6 cases ranging in age from one to five years Four with dacryocystitis, one phlyctenular conjunctivitis, and one with conjunctivitis and palpebral eczema All of these cases had a nasal infection The eye symptoms were treated locally, but the main treatment was directed to the nose The eye symptoms disappeared promptly and in direct ratio to the subsidence of the nasal condition

6 Asthma as prominent symptom, 9 cases, age ranging from three to ten years These cases I classify under the head of vaso-motor rhinitis The result of treatment is varying and at times very discouraging There is always, I believe, some endocrine disturbance which seems at times to be aggravated by certain foods, sometimes by various proteins, and sometimes it is impossible to get a reaction to any test

All cases that I have seen have had secondary nasal infections Tonsil and adenoid operations, in my experience, have had absolutely no beneficial effect. The cases that I have seen and examined before operation, I have found no adenoid tissue on palpation

Case No 1 Z M, age ten years History of asthma for past six years, operated on twice for tonsils and adenoids, with no remission of symptoms When I first saw this boy the nasal fossae were both blocked, there was present a clear, glary mucous, the entire nasal mucosa had the typical grayish-white, spongy appearance, which is characteristic in the cases No pus was found in the nose However, nasal cleansing was instituted to prevent secondary infection and on varying doses of pituitary and adrenal extract he has been almost entirely free of his nasal obstruction and asthmatic symptoms

Case No 2 C S, age three years This child was brought to me for a tonsil and adenoid operation about six months ago I advised against operation, as the nasal condition showed the same characteristics as Case No 1 About three months later, I saw the child again with the history that the tonsils and adenoids had been removed, but the child had the same symptoms that she had before operation, except that in addition there was an eczema about the face, eyes, ears, knees and elbows The parents were now willing to listen to reason Nasal treatment was instituted, the eczema was treated locally With the help of pituitary and suprarenal extract, the asthma has disappeared, as has the nasal obstruction, and the eczema is almost entirely recovered

7 Scarlet fever, from the standpoint of complications, 8 cases

Case No 1 E M, age twelve years About the seventh day following onset, developed pain in left ear I was called to see him for this complication The ears were found to be negative, but there was definite tenderness in the region of the sterno-mastoid muscle, the nose looked quite clean, as it had been under treatment from the onset of the disease The following day there was definite cervical glandular enlargement on the left side This remained and increased slightly with some involvement of the right cervical glands for four days On the fifth day he complained of some pain in his right eye, with some redness of the upper lid at the inner canthus Ophthalmoscopic examination revealed no fundus changed On the following day there was redness, edema and tenderness of both lids with a palpable mass at the nasal angle of the orbit Examination of the nose showed a septal spur pressing the middle turbinate tightly against the outer wall of the middle fossa, the whole nostril was filled with pus, temperature was 102°, and the child looked septic I considered it unwise to attempt to remove the septal spur with the amount of infection in the nose, so removed a portion of the naso-antral wall beneath the inferior turbinate, not removing any of the inferior turbinate I then washed through the antrum, the solution apparently going through the ostium and washing the middle fossa, the contents of which came out through the left nostril I continued this washing daily for a week with a remission of temperature, subsidence of the eye symptoms and reduction of the mass at the nasal angle of the orbit Ten (10) days after the drainage of the antrum, he had a sudden rise of temperature, with no pain, but a full feeling in the right ear On examination I found an acute tympanotitis of the right ear I did a

myringotomy and found free pus This condition cleared in three days, temperature returned to normal and convalescence from this point was uneventful

Case No 2 E W, age 6 years History of scarlet fever, following which she had had an afternoon temperature ranging from 100° to 102° over a period of eight weeks On examination, I found the ears negative, large infected tonsils, a great amount of muco-pus coming down from the naso-pharynx, both nostrils containing considerable muco-pus On instituting nasal treatment the afternoon rise in temperature disappeared, tonsils reduced markedly, nasal fossae returned to normal appearance Tonsils and adenoids were removed April 9th, 1924

In the treatment of these cases, I am convinced that suction is one of the most important adjuncts at our disposal After thoroughly cleansing the nose an application of one of the Silver preparations (Silvol 10% to 15%, or Argyrol 25%) while in the very severe cases, particularly the sluggish or very acute cases, I find iodine, carefully applied, of great benefit For home treatment, I advise nasal irrigations (normal salt solution), followed by installation of chlorazene ¼%, or some bland oil spray Internally, emulsion of cod liver oil, or some of the iron or arsenic preparations, fresh air and sunshine

In conclusion, I cannot too strongly urge (1) the routine examination of the nose, throat and lymphatics, (2) the constant and thorough cleansing and medication of the nose during the cold months when epidemics are prevalent, (3) the culturing of the nose to eliminate K. L., and obtain if possible the organism present, (4) fresh air and sunshine, even when temperature is present, (5) the internal use of cod liver oil

## ENDEMIC GOITER AS A PUBLIC HEALTH PROBLEM\*

By O P KIMBALL, M D

CLEVELAND, OHIO

Since the first practical application of the principle of goiter prevention in man in 1917 the use of preventive measures has been remarkably extended There has been a striking uniformity in the results obtained in this country and in Europe, and each year the published data have added further emphasis to the teaching of Marine that "endemic goiter is the easiest known disease to prevent"

The established facts regarding the function and chemistry of the thyroid gland when preventive measures were inaugurated may be summarized as follows

\*Read at the Annual Meeting of the Medical Society of the State of New York at Rochester April 22 1924

1 It seemed to be a well established fact that the thyroid maintained and controlled the metabolism above the myxedema level

2 It was known that the thyroid gland played an important part in the normal growth and development of childhood, and in some way influenced the changes at puberty and adolescence Whether these latter changes were brought about solely by the maintenance of the metabolism at its normal rate, or whether it was due to some function of the sex glands, or whether both influences were concerned was not known exactly

3 A remarkable relationship between the thyroid function and its iodine content had

been established for soon after it had been found that the normal thyroid contained iodine, we had demonstrated that the normal function of the thyroid was dependent on iodine

4 It had been found that the histological changes which always accompany the formation of a goiter were due to a deficiency of iodine. This was so universally true, not only in man but in all animals studied, that it became possible to speak of the variations in thyroid function, in terms of the iodine content. It was found that as long as the iodine content remained at or above 1 mg per gram of the dried gland (1 e, 0.1 per cent), no active hyperplasia took place, and that as soon as the iodine content fell below this amount active hyperplasia began.

5 The unusual thyroid activity during adolescence and during pregnancy and the consequent iodine deficiency and resultant hyperplasia at these periods were generally recognized. It was in accordance with these definitely proven physiological principles that the principle of goiter prevention was developed.

One of the first practical measures for the prevention of goiter was applied in 1910 at the Lakeside Maternity Dispensary when throughout pregnancy each patient received one ounce of syrup of hydriotic during each alternate month. During recent years this measure has been used in every maternity dispensary in Cleveland.

Marine's well-known study of the possibility of the prevention of goiter in fish was carried on in the Pennsylvania State Fish Hatcheries from 1909 to 1911. As the direct result of these and other studies in animals in 1916 the prevention of goiter was first considered as a problem of education and public health and the principle established by the earlier studies was practically applied in the schools of Akron, Ohio, with results which were so unmistakable that they left no doubt as to the value of the practical application of the principle of goiter prevention as a public health measure.

The questions of importance at the beginning of this preventive work were (1) How much iodine is needed, and (2) how is it best administered? Not having any standard, we arbitrarily decided to use two grams of sodium iodide given over a period of ten days each spring and fall.

From our observation and study during the first year of this test we concluded that a much smaller amount of iodine given once a week throughout the school year would be sufficient and a better method of administration, that is, by this method we could keep the thyroid constantly saturated and not run the risk of seeing an occasional ill effect from

the larger dose. However, even with the dose given at first (3 grs NaI daily), the only ill effect we encountered was an iodine rash in one of each thousand cases under treatment.

In 1918, when this preventive measure was initiated in the schools of Zurich, Switzerland, tablets containing 5 mgs of iodine each were administered once a week. The results as reported by Dr Klinger have been very striking. In 1921, in several of the schools in the Cleveland district we introduced the method used in Switzerland, using the same chocolate Iodostarine tablets, each containing 10 mgs of iodine and administering one tablet per week throughout the school year.

This method of administration has made this preventive work so easy and even popular among the school children, that its application has extended very rapidly throughout the endemic goiter districts of this country and Canada. For instance, this method has been used systematically in the schools of Grand Rapids, Michigan, for two years, during which time fifteen thousand children have been taking 10 mgs of iodine once a week. The Health Commissioner states that this is the most practical and popular health measure he has ever introduced.

Under the guidance of the State Health Department approximately one-third of the schools of West Virginia are applying this health measure. This is the case in Washington and Utah also. Several other State Boards of Health are making special studies, surveys and plans in order to apply the preventive method in the most practical way.

Since 1920, in accordance with the suggestion of Dr H. G. Sloan of Cleveland, the Eli Lilly Company have manufactured an iodized table salt which contains sodium iodide in the proportion of one part to five thousand. This, however, has never had more than a limited drug store sale, and no conclusions can be drawn as to the result of its use.

The State Health Department of Michigan has been studying this phase of the question for four years. During the past year they have made a detailed study of the iodine content of the water in four counties in different parts of the state—Midland, Wexford, Houghton and Macomb—according to the method recently worked out by McClendon. The final analysis which has been sent to me by the State Health Department is as follows. In Midland County a complete analysis of the water throughout the county shows an iodine content of approximately 12 parts per billion. The goiter survey of all the school children in this county (3,645) shows the incidence of goiter to be 32.7 per cent. Wexford County has no iodine in the water, and the incidence of goiter in all children (3,984) is 55.6 per

cent Houghton County has no iodine in the water and shows an incidence of goiter among all the children (13,725) of 64+ per cent. In Macomb County the water contains the greatest amount of iodine, approximately 20 parts per billion, and the incidence of goiter in all children (10,258) is only 26 per cent.

These studies give direct evidence of what we have thought to be the case, that is, that endemic goiter is due to a deficiency of iodine in food and drink. The amount of iodine in the water is the best index to the available iodine in any region because of the high solubility of iodine salts.

The State Health Department of Michigan has also been studying the possibility of making the iodine content of their food equal to that in districts where endemic goiter does not occur. They feel that the most practical method would be to increase the iodine content of the table salt, and to this end they have studied the amount of salt used by the average normal person, the iodine content of the various salt beds in Michigan and other states, and the practical problem of getting such an iodized salt into universal use.

No law has been made to force the wholesale dealers to sell only iodized salt. Yet by the close co-operation of the Department of Health, the State Medical Association, the salt manufacturers and the wholesale dealers it has been brought about that after May 1, 1924, all table salt sold in Michigan will contain a sufficient amount of iodine—as it is hoped—to prevent goiter, and the purpose of this salt and the need for it has been explained in announcements sent by the Health Department to all parents, physicians and teachers in the State. That these men have attained this end by willing co-operation without increasing the cost of the salt to consumers, is a high achievement on the part of the Health Department of the State of Michigan.

It should be borne in mind, however, that this is only the beginning of this plan, and we must not draw final conclusions as to its value until the event proves the case. Certain practical objections to this method of prevention which suggest themselves are the following. *First* No one knows just how much sodium iodide to put into the salt, because the amount of salt used by different healthy individuals is variable, for instance, if the proportion of sodium iodide in the salt is one per 10,000, then a normal individual who uses  $7\frac{1}{2}$  pounds of salt yearly will get approximately 300 mgs of iodine, which should prevent goiter. On the other hand, the adolescent girl who uses only half as much salt, may develop goiter. *Second* If the proportion of sodium

iodide in the salt is made one per 5,000 in order to prevent goiter among the children who eat comparatively small amounts of salt, then some adults who eat three times the average amount of salt may get into serious difficulty, especially if some abnormality of the thyroid already exists. All that we can do is to bear these points in mind and to hold our final judgment in abeyance until it can be based upon a sufficient accumulation of experience over a sufficiently long period.

During the past there has been considerable discussion as to the possibility of overcoming this deficiency by putting some form of iodine into the city water supply. A careful consideration of this method as it would be applied to any large city makes it appear that it would be wholly inadequate and very wasteful.

In this State no uniform method of goiter prevention could be applied as in Michigan for approximately only five counties of New York have a real endemic goiter problem. For the same reason this can never be made a Federal health measure, for endemic goiter does not exist in the majority of the states.

It would seem that the greatest good can be accomplished by a regular campaign of education regarding the cause and prevention of goiter in the counties in which goiter is endemic, under the direct supervision of the Health Departments of those counties, and the extension to every school in those counties of the practical preventive measure which is now being practiced in Syracuse, namely, the administration to each pupil of 10 mg of iodine—one iodostarine chocolate tablet—once a week. As a result of such a persistent educational and practical campaign, within a very few years the people will be caring for their own deficiency by the use of iodized salt if that proves to be efficient or by whatever other method the state or local Health Department may advise.

One of the most important, if not the most important phase of this whole goiter problem is the prevention of congenital goiter by the administration of iodine throughout the period of pregnancy. The importance of this point has never been sufficiently emphasized, and so this preventive measure is rarely used. It should be borne in mind that by this means it is possible to prevent most of the adenomatous goiters which are so unamenable to treatment. The administration of ten mgs of iodine per week throughout pregnancy and the period of lactation will prevent goiter in the mother and will insure a normal thyroid in the child. A proper and persistent educational campaign directed by the Health Department will soon lead every expectant mother to anticipate and demand this treatment.

been established for soon after it had been found that the normal thyroid contained iodine, we had demonstrated that the normal function of the thyroid was dependent on iodine

4 It had been found that the histological changes which always accompany the formation of a goiter were due to a deficiency of iodine. This was so universally true, not only in man but in all animals studied, that it became possible to speak of the variations in thyroid function, in terms of the iodine content. It was found that as long as the iodine content remained at or above 1 mg per gram of the dried gland (i.e., 0.1 per cent), no active hyperplasia took place, and that as soon as the iodine content fell below this amount active hyperplasia began.

5 The unusual thyroid activity during adolescence and during pregnancy and the consequent iodine deficiency and resultant hyperplasia at these periods were generally recognized. It was in accordance with these definitely proven physiological principles that the principle of goiter prevention was developed.

One of the first practical measures for the prevention of goiter was applied in 1910 at the Lakeside Maternity Dispensary when throughout pregnancy each patient received one ounce of syrup of hydriotic during each alternate month. During recent years this measure has been used in every maternity dispensary in Cleveland.

The goiter survey of all the school children in this county (3,645) shows the incidence of goiter to be 32.7 per cent. Wexford County has no iodine in the water, and the incidence of goiter in all children (3,984) is 55.6 per

policy, the plaintiff (employer) requested the insurance company to defend. The policy appears to have been a standard policy, and the insurance company declined, stating that it was not liable for payments to physicians. The employer permitted the doctor's action to go by default, and a judgment was recovered against the employer. Thereupon, the employer sued the insurance company, and the court held that the insurance company under its policy was obligated to defend and to pay the amount of the medical services. The employer thereupon obtained judgment against the insurance company.

It appears, therefore, that the physician, when authorized by the employer, has an absolute right against the employer, and under the standard policy the employer has a recourse against the insurance company. The procedure would undoubtedly be that after the physician sued the employer, the latter would send the papers to the insurance company, which would defend and would have to pay any judgment recovered. But there being no provision in the law or any privity between physician and the insurance company, the doctor could not directly force the insurance company to pay.

The Industrial Commissioner clearly has jurisdiction where the employee retains the physician. Section 13 covers that point, and provides the following requisites:

- (a) The employer must fail to provide medical treatment,
- (b) After request by the injured employee,
- (c) Form C-4 must then be filed,
- (d) Apparently no authorization is then required.

If these requirements are then complied with, the Commissioner has jurisdiction and apparently sole jurisdiction, not to make an award to the physician, but to give the physician a lien upon the compensation awarded to the workman to be paid therefrom in the manner fixed by the Commission as provided by Section 24 of the Statute.

It has been the practice of the referees of the Department of Labor to hear and decide cases presented by physicians who have not been paid for services, even when they have been authorized by the employer. The insurance carriers have been in the practice of defending these cases, and all parties have, with negligible exceptions, abided by the decision of the referees. In these cases the referees are apparently acting "extra jure" but in the interests of justice and common sense, otherwise the courts would be clogged with a multitude of petty cases. Furthermore, the physicians are beginning to realize the value of the written authorization, a bit of paper which guarantees their fee. These cases, then, if taken to the courts, would almost invariably be decided in favor of the physician with costs against the employer—a condition which would eventually

become very expensive for the insurance carrier, to say nothing of the antagonism that might be justifiably aroused in the employers who would be dragged into court by the doctor. It would be well, however, if all the physicians interested would communicate with their representative in the State Legislature to have the Law amended so that the referee would have legal jurisdiction in the determination of physicians' fees when the physician holds a written authorization from the employer. This would obviate the possibility of delay and annoyance in the collection of such fees, should present conditions be changed, or should a referee refuse to hear the doctor on the ground of "no jurisdiction."

At the present time there are two medical referees sitting on cases of this nature. Their duties, however, seem to include hearing cases of claims of injured employees, so that at times, they are not available for the purpose of hearing doctors' claims for medical services. At these times "lay" referees are assigned to hear the physicians' cases, and often their decisions are "bizarre," to put it mildly.

Physicians who desire a fair adjudication of their claims should write to the Industrial Commissioner and respectfully request that only medical referees be permitted to hear medical cases, whether it is the doctor's fee or any other medical question involved.

Section 13 of the law states that the physician treating a case is compelled to notify both the commission and the employer in writing within 20 days from the initial treatment. However, when the physician holds a written authorization from the employer he will be considered to have complied with the above requirement under the present attitude of the medical referees, for the reason that such authorization constitutes a contractual relation between physician and employer. Therefore knowledge of the accident on the part of the employer is assumed. The law requires the employer to notify the commission in the event of an accident. Knowledge of the accident on the part of the commission is therefore assumed. It is very essential to obtain authorization in writing. The written authorization should be in the following form—

Doctor .....  
Address

Please render .....  
of .....  
(Name of Patient)  
(Home Address)

such surgical treatment as is required  
Employer  
Address .....  
Insurance Co

Once the physician is in possession of a written authorization from the employer he is free

# THE PHYSICIAN AND THE COMPENSATION LAW

By ALBERT E. MAN, M.D.,  
NEW YORK, N. Y.

**S**INCE the advent of the New York State Compensation law about 10 years ago, revolutionary changes have come about in the relation of the physician to the patient who happens to be an employee, under the meaning of the word as defined under that law.

The inter-relation of Physician—Employer—Employee—Insurance Carrier (company) and the Department of Labor, which supervises these relationships, has proven to be an obstacle in the way of many physicians in their relationships with this class of patient, because the necessity of recognizing the newly related bodies, *i.e.* employer, carrier and Labor Department, has insinuated a new and apparently unassimilable element into their (the doctors') routine.

A working knowledge of the Compensation Law should be part of the doctor's stock of information just as is a similar knowledge of the Federal and State Prohibition and Narcotic laws. The acquisition of such knowledge is not a formidable undertaking; and indeed because it is practical to set it forth in a brief space, it shall be included in this paper. It will be well first, to define the terms—Employer—Employee—and the Insurance Carrier.

**Employer**—An employer is one who engages individuals to work. He has a certain number of employees under his supervision who are working for him for a fixed wage—so much a week, or so much a month, or so much a year, or doing piece work. The legal definition is as follows: "Employer," except when otherwise expressly stated, means a person, partnership, association, corporation, and the legal representatives of a deceased employer, or the receiver or trustee of a person, partnership, association or corporation, employing workmen in hazardous employments including the state and a municipal corporation or other political subdivision thereof (Subd 3 am'd by L 1914, ch 316).

**Employee**—An employee is one who contracts with an employer to work for such a wage. The legal definition is as follows: "Employee" means a person engaged in one of the occupations enumerated in section three or who is in the service of an employer whose principal business is that of carrying on or conducting a hazardous employment upon the premises or at the plant, or in the course of his employment away from the plant of his employer, and shall not include farm laborers or domestic servants (Subd 4 am'd by L 1916, ch 622, and L 1922, ch 615).

**Carrier**—By a carrier is meant the Insurance Company—the insurance representative of the employer. Article 1, Subd 12, states "Insurance Carrier" shall include the state fund, stock cor-

porations or mutual associations with which employers have insured, and employers permitted to pay compensation directly under the provisions of subdivisions three or four of section fifty (Subd. 12 am'd by L 1922, ch 615).

The New York State Compensation law requires all employers to insure against the contingency of paying an injured employee for loss of time, loss of a part of the body, and medical expenses to which he is entitled.

Under the New York Compensation law it is the employer who furnishes medical attention and should he fail to provide adequate medical attention the employee may provide it for himself. Under the law, when an employee is injured he is required to report the accident to his employer, and to file any claim within 30 days in writing. He is required to request medical services from the employer.

On the law as it has up to date been decided, where a contractual relation exists between the physician and the employer, the Industrial Commission has no jurisdiction to determine the physicians' fees or to award them. However, the law has not been enunciated by the highest courts.

The cases in point are Appellate Term cases. No doubt, the parties in those cases did not care to go further and were satisfied with the decisions. However, until a higher court of the State passed upon the question, these cases are decisive. These cases are:

*Felstein vs Buick Motor Co*, 187 NYS, p 517.

In that case the facts were that the plaintiff, a physician, sued the employer for professional services rendered at the request of the employer. The defendant resisted the claim, contending that the physician's *exclusive* remedy was by application to the Industrial Commissioner, and that therefore the Civil Court had no jurisdiction. Mr Justice Wagner writing the opinion, states:

"Recourse to a court of law, therefore follows as the *sole* remedy in the absence of a proper, express and comprehensive provision for enforcement under the act."

This means that where the physician is employed by the employer (and a contractual relation may exist in each individual case or over a definite period of time) the only remedy of the physician is by Civil action against the employer. Having reached that point, we come to the case of:

*Zamkin vs U S F & G Co*, 201 NYS, p 712.

There a workman of the plaintiff was injured. The plaintiff engaged a physician but refused to pay. The physician sued the plaintiff. Under its

- 11 State in patient's own words how the accident occurred
- 12 Give an accurate and complete description of nature and extent of the injury
- 13 Is the claimant's present disability a result of the injury above described
- 14 Will the injury result in
  - (a) Permanent defect if so, what
  - (b) Facial or head disfigurement
- 15 On what date do you think the injured person will be able to resume his usual work
- 16 On what date do you think the injured person will be able to resume any work

Form C-4 is considered *Prima Facie* evidence before the commission and if sent to the commissioner within 20 days following the beginning of treatment will be accepted as a rule in place of the physician's personal attendance at any hearing that may take place

However this practice is taken advantage of mainly, in regard to claims of injured for compensation due them exclusive of the doctor's fees and it is advisable in the event of a physician's bill being the subject of controversy that the physician or his representative be present at the hearing

There exists at the present time a condition of affairs in the relations of the physician and the insurance carrier, which while it does not come under the head of the compensation law is a direct outgrowth of it and of major importance to the physician. The condition referred to is the (so-called) "lifting of cases" on the part of the insurance carrier. Some physicians who feel that they have suffered unjustly from this practice refer to it as "stealing cases."

Many insurance carriers maintain clinics and a staff of physicians. As soon as they are notified of an accident, they get in touch with the patient and attempt to persuade him to quit the doctor attending him and come to the clinic.

Under pressure the patient often acquiesces and the doctor has lost a patient. This practice can only be combatted if the doctor anticipates it and warns the patient in advance to ignore any

threats, blandishments or other methods employed to this end.

In justice to the insurance carriers, it must be said, however, that they have to contend at times with medical men who are not too scrupulous. It is claimed that some doctors overcharge and pad their bills, that is, they charge for more visits than the patient makes. It is claimed that some doctors are notorious in this respect and of course the insurance companies soon find them out.

The majority of insurance companies, however, particularly the large ones of the better class, do not molest the patients of physicians whom they find to be honest. The first or second time an insurance company has dealings with a doctor, it may, by way of being on the safe side "lift" the case. Once the doctor is found to be honest and efficient he should have little trouble from this source.

At the same time it is a fact that there exist a few small and even an occasional large insurance company that evade their obligations routinely. This type of insurance carrier is a nuisance of the first class.

There are over sixteen thousand physicians in New York State, a body of men representing the most intelligent and influential of our citizens. Under proper leadership their combined efforts could quickly and easily eliminate through legal channels any man or group of men who are imposing on the community. Steps are now being taken to this end. Forcing an injured workman to accept the services of an insurance carrier physician might easily be construed as requiring him to testify against himself in the event of any hearing concerning his claim for compensation. The physician's testimony in an accident case is of prime importance.

The co-operation of the physicians of the State is invited to put an end to improper practices wherever they occur.

The writer will be glad to receive and turn over to the proper authorities communications that will further this object. Only by such action may justice and fairness be guaranteed to the physician and his patient.

to proceed as with any other patient, and apparently will be upheld in his actions by the courts should any reasonable bill or treatment be questioned by the employer

Unless the authorization is revoked in writing, the physician may employ nurses, trained or practical, may furnish apparatus or dressing to any amount necessary, may call consultants of his own choosing and as often as necessary, and may treat the patient unmolested until cured, regardless of the time necessary. The insurance carrier has no right to interfere on any ground, while treatment is in progress

Reasonableness of fee is required under the law, and while there exists no schedule of fees, these are limited to such charges as prevail in the same community for similar treatment of injured persons of a like standard of living" (Section 13)

The following three paragraphs are extracted from article 24—"A physician called by the injured employee cannot sue the employer or insurance carrier—but a physician employed by the employer to treat his injured employee is not limited—and may sue the employer,"

An employer cannot maintain an action against a third party for medical services of the employer to his employee injured by the third party—nor can the Industrial Board give relief in such case

Dispensaries licensed under the State Charities Law—may receive and treat Workmen's Compensation cases"

A physician who treats a workman brought into a hospital clinic in an ambulance or other conveyance, if on duty at the time, should send in his personal bill, just as though the case were brought to his private office

Insurance carriers have no right to order an employer to send his injured employees to doctors designated or employed by the carrier. In fact it is a recognized principle that "the insurance carrier has no voice in the selection of the physician" (Case of Mezheritsky vs Mezheritsky and Miller, etc)

Certain injuries occurring to workmen are not compensatable and in such cases the physician must look to the employee for his fee. The accident or disease in order to be compensatable must arise out of or in the course of his employment. As this feature of the law is of great moment to physicians, we will present some illustrative cases culled from decisions that have been made

Injury and personal injury mean only accidental injuries arising out of and in the course of employment and such disease or infection as may naturally and unavoidably result therefrom

According to definition approved by the Appellate Division and the Court of Appeals, an accident is "an unlooked for mishap or an untoward event which is not expected or designed," being limited so that "an act done deliberately and wil-

fully by a third party may be an accident from the viewpoint of employer and employee."

Loss of vision due to strong light is not an accident, neither is swelling of an elbow due to constant twisting of cans, neither is illness due to repeatedly dipping the fingers in poisonous solutions. For want of evidence showing causal connection, the courts have reversed awards for frog felon alleged to have been due to constant use of a screw driver

A wound not incurred in the employment but permitting infection in the employment may be a compensatable accident, also puncturing or bursting of a blister, permitting infection, also cracking of the skin, admitting a poisonous powder, also heat prostration, also frostbite, also dizziness due to working position, also strain due to prolonged overreaching and lifting, also fright, also exposure to an excessive draft of cold air, also chill from working in icy water, also drinking water polluted with typhoid germs, also inhalation of dust, also asphyxiation, also inhalation of poisonous fumes or gases

While the above points are stated briefly and without elaboration they really constitute the sum total of the Workmen's Compensation law as far as the physician is concerned

In order for the physician to benefit to the fullest extent the following summary of his obligations should be observed —

1 Secure written authorization, signed by the employer in person or his authorized agent, foreman or manager

2 Keep fees within reason—examples

\$2 to \$3 for dressings

\$75 to \$100 for hernia operations

\$100 to \$150 for limb amputations

\$200 to \$300 for kidney removal

3 Send bills to employer and duplicate bill with surgeon's report on Bureau of Workmen's Compensation form C-4, to insurance carrier

4 If insurance carrier does not reply or fails to pay, request a hearing from the Industrial Commissioner in writing

5 Keep an accurate record of the case and be prepared to answer the following questions, which constitute the body of form C-4

1 Name of injured person

2 Present address

3 Name of employer

4 Office address

5 Date of accident

6 Was first treatment rendered by you  
When

7 If not, by whom  
Address

8 When did you first treat claimant

9 Who engaged your services

10 Was injured person removed to hospital  
Name and address

- 11 State in patient's own words how the accident occurred
- 12 Give an accurate and complete description of nature and extent of the injury
- 13 Is the claimant's present disability a result of the injury above described
- 14 Will the injury result in
  - (a) Permanent defect if so, what
  - (b) Facial or head disfigurement
- 15 On what date do you think the injured person will be able to resume his usual work
- 16 On what date do you think the injured person will be able to resume any work

Form C-4 is considered *Prima Facie* evidence before the commission and if sent to the commissioner within 20 days following the beginning of treatment will be accepted as a rule in place of the physician's personal attendance at any hearing that may take place

However this practice is taken advantage of mainly, in regard to claims of injured for compensation due them exclusive of the doctor's fees and it is advisable in the event of a physician's bill being the subject of controversy that the physician or his representative be present at the hearing

There exists at the present time a condition of affairs in the relations of the physician and the insurance carrier, which while it does not come under the head of the compensation law is a direct outgrowth of it and of major importance to the physician. The condition referred to is the (so-called) 'lifting of cases' on the part of the insurance carrier. Some physicians who feel that they have suffered unjustly from this practice refer to it as 'stealing cases'

Many insurance carriers maintain clinics and a staff of physicians. As soon as they are notified of an accident, they get in touch with the patient and attempt to persuade him to quit the doctor attending him and come to the clinic

Under pressure the patient often acquiesces and the doctor has lost a patient. This practice can only be combatted if the doctor anticipates it and warns the patient in advance to ignore any

threats, blandishments or other methods employed to this end

In justice to the insurance carriers, it must be said, however, that they have to contend at times with medical men who are not too scrupulous. It is claimed that some doctors overcharge and pad their bills, that is, they charge for more visits than the patient makes. It is claimed that some doctors are notorious in this respect and of course the insurance companies soon find them out

The majority of insurance companies, however, particularly the large ones of the better class, do not molest the patients of physicians whom they find to be honest. The first or second time an insurance company has dealings with a doctor, it may, by way of being on the safe side 'lift' the case. Once the doctor is found to be honest and efficient he should have little trouble from this source

At the same time it is a fact that there exist a few small and even an occasional large insurance company that evade their obligations routinely. This type of insurance carrier is a nuisance of the first class

There are over sixteen thousand physicians in New York State, a body of men representing the most intelligent and influential of our citizens. Under proper leadership their combined efforts could quickly and easily eliminate through legal channels any man or group of men who are imposing on the community. Steps are now being taken to this end. Forcing an injured workman to accept the services of an insurance carrier physician might easily be construed as requiring him to testify against himself in the event of any hearing concerning his claim for compensation. The physician's testimony in an accident case is of prime importance

The co-operation of the physicians of the State is invited to put an end to improper practices wherever they occur

The writer will be glad to receive and turn over to the proper authorities communications that will further this object. Only by such action may justice and fairness be guaranteed to the physician and his patient

## THE LEGISLATION DEPARTMENT OF THE JOURNAL

The principal reason for publishing this Journal weekly during the months of winter and early spring is to inform our members regarding legislative bills which affect public health or the medical profession. To list the bills as they are introduced, and to print the more important ones require fifteen pages of each issue. About the usual number of bills have been introduced and the same subjects covered as in the past. One year's grist of the legislative mill is about like that of any other year.

We expect to continue to print descriptions of the bills as fast as they are introduced, and to comment on them from time to time during their progress, or retrogression through the legislature.

The more important bills are nearly the same as they were in 1924, and our comments last year will apply equally well this year. However, our members may expect that in the future an increasing proportion of our space will be given to comments and explanations of the bills.

## IDEALS OF A COUNTY MEDICAL SOCIETY

Of what does a County Medical Society consist?

The ideal county medical society consists of all the physicians who live in the county. This ideal is almost reached in a few counties. The average county society enrolls from 65 to 70 per cent of the physicians of a county. There are about 15,000 physicians in New York State of whom somewhat less than 11,000 belong to the county medical societies.

A county medical society has all kinds of physicians in its membership list. There are general practitioners and specialists, insurance men and public health workers, surgeons and laboratory technicians, salaried doctors and fee collectors, young doctors seeking business and retired physicians who cannot drive their old patients away. The membership includes scientists and sports, smokers and haters of nicotine, church goers and golfers, farmers and society butterflies—every conceivable class is represented except the rascals,—and there are so few rascals in the profession that the name of one who happens to afflict a community immediately becomes a by-word of scorn among physicians.

What are the common bonds between the members of a county society? They may be classed as internal and external.

The internal bonds are those of congeniality. Physicians share in the common aims and ideals of the profession and carry the secrets of the inmost lives of every person in the community. No other group of persons are trusted as the doctors are. They naturally form a fraternity in which each trusts the other and confidence is seldom abused. The County Medical Society is the basic medical fraternity which is open to practically every physician in the state, and its sociability and friendship appeal to an increasing proportion of the physicians of New York State.

Then, too, there are the tangible bonds between the members of the county medical societies—a subscription to the *NEW YORK STATE JOURNAL OF MEDICINE*, defense in mal-practice suits, and a share in the post-graduate instruction afforded by the programs of the meetings. What physician can afford to miss these opportunities?

The external bonds between members of county medical societies are those of a common civic duty. Physicians are public spirited and

are willing to donate their share of services to the community. The ministers of the Gospel contribute inspiration toward righteous living, the lawyer leads in village improvements, the firemen save property and lives, and the physician is willing and anxious to advise the community in regard to pure milk, wholesome water, sewage disposal, and protection against contagious diseases.

While the physician is willing to contribute his medical skill to the community, he has small influence except in a collective way. The practice of *civic medicine* is done principally by means of medical societies. The great bond which justifies the existence of medical societies in the eyes of the public is the appeal of its civic activities. Any physician is proud to belong to a medical society which accomplishes things in a community.

What can a physician contribute to a county medical society? The society has need of many kinds of gifts. One physician has superior ability as a financier—he will be chairman of the ways and means committee, another has the gift of writing, and he will be chairman of the publicity committee, one is a good mixer and a politician, and he will be chairman of a legislative committee. For every position which requires a special talent, some physician can be found who has both the skill and the desire to fill it.

And when the positions are all filled by local specialists, the great mass of members will be proud of their medical society and will gladly support its activities with their dues and their influence, and will feel that their leaders are voicing the ideals and aspirations which they have but cannot express.

It is the object of the State Medical Society to express the aims and policies of the county societies, to advise them regarding lines of work to undertake and to give publicity to the work which they have accomplished. We have watched with great satisfaction the growth of a sense of civic responsibility among the members of the county medical societies throughout the entire State of New York. County societies are rapidly making their influence felt in the community, and are bringing honor to the medical profession and the respect of the community to the individual physicians.

## CONVICTION UNDER HARRISON NARCOTIC LAW, AND ITS EFFECT ON A PHYSICIAN'S LICENSE

The license of any medical practitioner is automatically revoked should he suffer conviction of a felony. This is a very severe punishment that is inflicted in addition to the sentence that the criminal court imposes as a penalty for the conviction.

One naturally thinks of a felon as a debased person who is safer behind prison bars than at large in society, and that naturally such a person should not be permitted to practice medicine or law. The felony one has in mind in this way involves acts of moral turpitude, acts that in themselves are wrong—statute or no statute. It is wrong to take human life, to steal, to grievously injure another without cause, whether or not the statute says so.

But there are many felonies in the commission of which there is no wrong other than the wrong of doing something the law prohibits. To illustrate a physician the day before the Harrison Narcotic Law became effective prescribed nar-

cotics for a patient, ethically and properly, for the patient's good. The same act the next day became unlawful unless the physician had conformed to the new statute. For such violation he could be convicted of a felony and lose his license to practice. Thus by mere legislative act a man is made a felon over night, and yet he has done nothing inherently immoral or wrong.

It seems clear that so long as our Legislatures and Congress are making acts that are legal and proper today felonies tomorrow, the law that works automatic forfeiture of a doctor's license for conviction of felony should be modified so that the Regents would have power to inquire into the facts and revoke his license only when the physician so convicted has been guilty of moral turpitude. In this way the drug peddler would still feel the full rigor of the law, as he should, but the doctor, whose offense has been inadvertent, would not be given the same treatment and his professional career and life ruined.

## OPERATION WITHOUT CONSENT

This action was instituted against two physicians, and the complaint charged that one of them was engaged to remove a growth from the plaintiff's breast and that without the plaintiff's knowledge or consent and contrary to her expressed directions, desires and wishes this surgeon engaged another surgeon to perform the operation, that by reason of the negligence of defendants the second surgeon in attempting to perform the operation upon the plaintiff contrary to her directions and without her knowledge or consent made a four-inch incision in the plaintiff's body several inches from the point of the growth on the plaintiff's breast and that they failed to remove the growth on the breast or in any way remedy this condition of the plaintiff, that by reason of the negligence of the defendants in their operation at a different place upon her body without her consent, plaintiff claims that she suffered injury, that the condition for which she was to be operated upon was not relieved, that it was necessary for her to submit to a further operation to relieve such condition and that she was required to expend moneys for medical nursing and hospital care.

The plaintiff had consulted the first physician for a lump in her right breast near the median line which had been there for several years. She was advised that it was best that she be operated upon for the removal of the lump. Arrangements were subsequently made for the performance of the operation and the plaintiff entered the hospital. The first physician arranged with another surgeon to perform the operation. The plaintiff protested against the performance of the operation by the second surgeon. She was advised, however, that the anaesthesia would be given by the first physician and she then consented to the operation for the removal of the lump on her breast. The plaintiff was anaesthetized and both physicians examined her while under the anaesthesia, but could not locate the swelling complained of. The second physician, however, felt a small mass about four inches lower than the one complained of by the plaintiff. An operation was performed upon the mass which was located about four inches below the point complained of and a small tumor removed. The incision was closed and the plaintiff made a good recovery,

leaving the hospital in about ten days. Subsequently the suit for operation without consent was instituted against both physicians. The consent of the plaintiff to perform a specific operation did not carry with it consent for the surgeons to

perform the operation which they did and under the authorities of this state the same was an operation without consent or an assault. Before trial the matter was compromised by a payment to the plaintiff by the defendants.

---

### SALPINGITIS CLAIMED DUE FROM STEM PESSARY INSERTED BY PHYSICIAN

In this action it was charged that the plaintiff a married woman, had consulted the defendant, a physician, who advised her with respect to her physical condition arising from the insertion in her person of an article described by the plaintiff as a button and which, it was claimed, had been inserted by the defendant about two years prior thereto. It was further claimed that after examination by the defendant, he advised that it was necessary for the plaintiff to be operated upon by reason of the condition caused by the button, that the defendant did perform an operation upon the plaintiff which, it is claimed, was carelessly and negligently done, causing injury to the plaintiff.

The plaintiff had sought the defendant's advice and upon a physical examination made by him he found within her person a metal stem pessary. From the patient's history and his examination he concluded that she had previously thereto been pregnant and had had an incomplete abortion. The uterus was found to be large and soft and somewhat swollen on one of the sides. The pessary was removed and the patient advised to remain in bed, that the physician would see her within a few days to determine what had developed. She was then advised that it would be necessary to perform a curettage, and under a general anaesthesia the uterus was cleaned by manipulation and by a dull curette, there being extracted small pieces of decomposed membrane. At this time she had a slight rise in temperature. The patient was put to bed and a few days there-

after her temperature became normal. She subsequently complained of pain in the region of the ovaries and tubes. The patient was ordered to bed and an ice bag applied. When the defendant returned the following day another physician was attending the plaintiff and the defendant was discharged from further treatment of the case. The defendant's treatment of the plaintiff took place during the first ten days of June. Towards the end of June she entered hospital where the attending surgeon performed a salpingo oophorectomy with drainage. Upon examination there was found that the plaintiff was suffering from salpingitis and that the operation was necessary. The patient remained at the hospital for about six weeks. The pathological report showed an acute suppurative salpingitis and a smear of pus bacteriologically examined showed the presence of pus cells.

Upon the trial of the action the plaintiff offered testimony in support of the allegations of her complaint. She also compelled the appearance under a subpoena of the surgeon who had performed the operation, who testified to the operation performed by him, but refused to testify as an expert or offer any opinion as to the cause of the plaintiff's condition. The defendant in his own behalf testified to his version of his examination, treatment and care of the plaintiff and supported his testimony by that of experts. After several hours of deliberation the jury vindicated the defendant by rendering a verdict in his favor.

## CONVICTION UNDER HARRISON NARCOTIC LAW, AND ITS EFFECT ON A PHYSICIAN'S LICENSE

The license of any medical practitioner is automatically revoked should he suffer conviction of a felony. This is a very severe punishment that is inflicted in addition to the sentence that the criminal court imposes as a penalty for the conviction.

One naturally thinks of a felon as a debased person who is safer behind prison bars than at large in society, and that naturally such a person should not be permitted to practice medicine or law. The felony one has in mind in this way involves acts of moral turpitude, acts that in themselves are wrong—statute or no statute. It is wrong to take human life, to steal, to grievously injure another without cause, whether or not the statute says so.

But there are many felonies in the commission of which there is no wrong other than the wrong of doing something the law prohibits. To illustrate, a physician the day before the Harrison Narcotic Law became effective prescribed nar-

cotics for a patient, ethically and properly, for the patient's good. The same act the next day became unlawful unless the physician had conformed to the new statute. For such violation he could be convicted of a felony and lose his license to practice. Thus by mere legislative act a man is made a felon over night, and yet he has done nothing inherently immoral or wrong.

It seems clear that so long as our Legislatures and Congress are making acts that are legal and proper today felonies tomorrow, the law that works automatic forfeiture of a doctor's license for conviction of felony should be modified so that the Regents would have power to inquire into the facts and revoke his license only where the physician so convicted has been guilty of moral turpitude. In this way the drug peddler would still feel the full rigor of the law, as he should, but the doctor, whose offense has been inadvertent, would not be given the same treatment and his professional career and life ruined.

## OPERATION WITHOUT CONSENT

This action was instituted against two physicians, and the complaint charged that one of them was engaged to remove a growth from the plaintiff's breast and that without the plaintiff's knowledge or consent and contrary to her expressed directions, desires and wishes this surgeon engaged another surgeon to perform the operation, that by reason of the negligence of defendants the second surgeon in attempting to perform the operation upon the plaintiff contrary to her directions and without her knowledge or consent made a four-inch incision in the plaintiff's body several inches from the point of the growth on the plaintiff's breast and that they failed to remove the growth on the breast or in any way remedy this condition of the plaintiff, that by reason of the negligence of the defendants in their operation at a different place upon her body without her consent, plaintiff claims that she suffered injury, that the condition for which she was to be operated upon was not relieved, that it was necessary for her to submit to a further operation to relieve such condition and that she was required to expend moneys for medical nursing and hospital care.

The plaintiff had consulted the first physician for a lump in her right breast near the median line which had been there for several years. She was advised that it was best that she be operated upon for the removal of the lump. Arrangements were subsequently made for the performance of the operation and the plaintiff entered the hospital. The first physician arranged with another surgeon to perform the operation. The plaintiff protested against the performance of the operation by the second surgeon. She was advised, however, that the anaesthesia would be given by the first physician and she then consented to the operation for the removal of the lump on her breast. The plaintiff was anaesthetized and both physicians examined her while under the anaesthesia, but could not locate the swelling complained of. The second physician, however, felt a small mass about four inches lower than the one complained of by the plaintiff. An operation was performed upon the mass which was located about four inches below the point complained of and a small tumor removed. The incision was closed and the plaintiff made a good recovery.

§ 1210 Definition of intoxicating liquor When used in this article the phrase "intoxicating liquor" shall be construed to include alcohol, brandy, whiskey, rum, gin, beer, ale, porter and wine, and in addition thereto any spirituous vinous, malt or fermented liquor liquids and compounds, whether medicated, proprietary patented or not, and by whatever name called containing one-half of one per centum or more of alcohol by volume which are fit for use for beverage purposes

§ 1211 Definition of intoxicating liquor to conform to federal statute Notwithstanding the provisions of the preceding section, the phrase intoxicating liquor, for the purpose of this

article, shall have the meaning defined by the congress from time to time hereafter for the purpose of enforcing the provisions of the eighteenth amendment to the constitution of the United States If this section be held to be invalid, it is hereby provided that other provisions of this article which are not expressly held to be invalid shall continue in full force and effect

§ 1212 Prohibited transactions in intoxicating liquor 1 Any person who barter, transports, imports, exports, delivers, furnishes, manufactures or sells any intoxicating liquor to be used for beverage purposes, or who barter, transports, imports, exports, delivers, furnishes, manufactures or sells any intoxicating liquor for non-beverage purposes, unless he shall be the holder of a permit therefor from the proper federal authorities and shall have registered such permit as provided in this article, shall be punishable for a first offense by a fine of not more than one thousand dollars, or by imprisonment for not more than six months, and for a second and subsequent offense by a fine of not less than two hundred dollars nor more than two thousand dollars, and by imprisonment for not less than thirty days nor more than five years

2 Any person who possesses any intoxicating liquor to be used for beverage purposes, or who possesses any intoxicating liquor for nonbeverage purposes, unless he shall be the holder of a permit therefor from the proper federal authorities and shall have registered such permit as provided in this article, shall be punishable upon conviction for the first offense by a fine of not more than fifty dollars, and upon conviction for a second offense by a fine of not less than one hundred dollars nor more than one thousand dollars, or imprisonment for not more than ninety days or both, and upon conviction for any subsequent offense by a fine of not less than five hundred dollars and imprisonment for not less than three months nor more than two years

§ 1213 Exceptions, application of article Nothing in this article shall be construed to forbid

1 The possession of intoxicating liquor in one's private dwelling or abode while the same is occupied by him as a dwelling, provided such intoxicating liquor was legally his property before the enactment of this section and is for use only for the personal consumption of the owner thereof and his family residing in such dwelling and of his bona fide guests when entertained by him therein

2 The manufacture and possession of nonintoxicating cider and fruit juices by a person exclusively for use in his home

3 The temporary possession of cider by the manufacturer thereof and its sale by him to a manufacturer of vinegar, who is the holder of a permit from the proper authorities of the United

Assembly Int 678—Public Health Law, requiring that every person employed in preparing or handling of food in any factory or other place shall, at time of entering employment and every six months thereafter, be examined by a physician to determine whether person has a communicable disease 'Bill printed in February 13th Journal

## SUMMARY OF BILLS INTRODUCED IN LEGISLATURE IN SENATE

Senate Int No 11 (conc Assembly Int 64)—A bill introduced in the Senate by Senator Seabury C Mastick of Westchester County, concurrent Assembly Int No 64, introduced in the Assembly by Assemblyman Herbert R Shonk of Westchester County, would amend sections 172, 181, Labor Law, by prohibiting employment of females over 16 years of age more than 48 hours a week in factories and mercantile establishments, except that for not exceeding eight weeks in any year, divided into not more than six days or 54 hours a week or nine hours a day provided notice of such extension of working hours be sent to Industrial Commissioner at least three days before

Referred to Labor and Industries Committee of both houses No action on bill as yet

*Comment* Unless comment or request should come from any member of the Society relative to the above bill, the Committee on Legislation will drop it from the list and not revive it save as there may be amendments offered thereto which concern the medical profession

Senate Int No 29 (conc Assembly Int 527)—A bill introduced in the Senate by Senator B Roger Wales of Binghamton, N Y, concurrent Assembly Int 527, introduced in the Assembly by Assemblyman Edmund B Jenks, of Broome County, would add new article 113, Penal Law, relative to intoxicating liquor

Referred to Codes Committees of both houses

*Comment* This is an act to amend the Penal Law by inserting a new article to be known as Article 113, beginning with section 1210, which defines intoxicating liquors naming certain liquids "whether medicinal, proprietary, patent or not, and by whatever name called, containing one-half of one per cent of alcohol by volume which are fit for use for beverage purposes"

Section 1211, however, gives the latitude that this construction shall have the meaning defined

by Congress from time to time hereafter for the purpose of enforcing the provisions of the 18th amendment \* \* \* If this section be held to be invalid, "it is hereby provided that other provisions of this article which are not expressly held to be invalid shall continue in full force and effect"

Section 1212, subsection 1, notes the prohibitive transaction in intoxicating liquors to be used for beverage purposes \* \* \* "or sells any intoxicating liquor for non-beverage purposes unless he shall be the holder of a permit therefor from the proper federal authorities, and so on \* \* \*

Subsection 2 provides for conviction and fine of any person who possesses any intoxicating liquor to be used for beverage purposes "or who possesses any intoxicating liquor for non-beverage purposes unless he shall be a holder of a permit," etc

Section 1213 excepts, first, the possession of intoxicating liquor in one's private dwelling or abode, etc

Subsection 2 mentions non-intoxicating cider and fruit juices exclusively for use in his home

Subsection 3, the temporary possession of cider to be sold to a manufacturer of vinegar, etc

Subsection 4 relates to a manufacturer of intoxicating liquor

Subsection 5 has to do with possession, storage and removal of lawfully acquired liquor

Subsection 6, the purchase of sacramental wines by a minister, priest, rabbi, etc

Subsection 7, the purchase and sale of warehouse receipts

Section 1214, 1214-a, 1215 and 1216 are printed here in full

A consignee shall not accept nor receive any package containing any intoxicating liquor upon which there appears a statement known to him to be false, and no carrier nor other person shall consign, ship, transport or deliver any such package, knowing such statement to be false

No person shall give to any carrier or any officer, agent or person acting or assuming to act for such carrier an order requiring the delivery to any person of any intoxicating liquor or package containing such liquor consigned to, or purporting or claimed to be consigned to a person, when the purpose of the order is to enable any person not an actual bona fide consignee to obtain such liquor

§ 1214-d Illegal advertisements in respect of intoxicating liquor No person shall advertise anywhere, or by any means or method, intoxicating liquor, or the manufacture, sale, keeping for sale or furnishing of the same, or where, how, from whom or at what price the same may be obtained No one shall permit any sign or billboard containing such advertisement to remain upon one's premises But nothing in this section shall prohibit manufacturers and wholesale druggists holding permits to sell intoxicating liquor from furnishing price lists, with description of such liquor for sale, to persons permitted to purchase such liquor, or from advertising alcohol in business publications or trade journals circulating generally among manufacturers of lawful alcoholic perfumes, toilet preparations, flavoring extracts, medicinal preparations and like articles

§ 1214-e Unlawful utensils, et cetera, for manufacture No person shall advertise, manufacture, sell or possess for sale any utensil, contrivance, machine, preparation, compound, tablet, substance formula, direction or recipe advertised, designed or intended for use in the unlawful manufacture of intoxicating liquor

§ 1214-f Unlawful solicitation of orders No person shall solicit or receive, or knowingly permit his employee to solicit or receive, from any person any order for intoxicating liquor or give any information of how such liquor may be obtained in violation of this article.

§ 1214-g Maintenance of place where violations are committed No person shall maintain any room, house, building, boat, vehicle, structure or place where intoxicating liquor is manufactured, sold, given away, kept or bartered in violation of this article, and all intoxicating liquor and property kept and used in maintaining the same is hereby declared to be a common nuisance, and any person who maintains such a common nuisance shall be guilty of a misdemeanor and upon conviction thereof shall be fined not more than one thousand dollars or be imprisoned for not more than one year or both

If a person has knowledge or reason to believe that his room, house, building, boat, vehicle, structure or place is occupied or used for the manufacture or sale of such liquor contrary to the provisions of this article, and suffers the same to be so occupied or used, such room, house, building, boat, vehicle, structure or place shall be subject to a lien for and may be sold to pay all fines and costs assessed against the person guilty of such nuisance for such violation, and any such lien may be enforced by action in any court having jurisdiction

§ 1214-h Possession or taking orders in violation of article No person shall, with intent to effect a sale of intoxicating liquor by himself, his employee, servant or agent, for himself or any person, company or corporation, keep or carry around on his person, or in a vehicle, or other conveyance whatever, or leave in a place for another to secure, any intoxicating liquor, or travel to solicit, or solicit, or take, or accept orders for the sale, shipment or delivery of intoxicating liquor, in violation of this article

§ 1214-i Non beverage preparations The articles enumerated in this section after having been manufactured and prepared for the market, shall not be subject to the provisions of this article, if they correspond with the following descriptions and limitations, namely

1 Denatured alcohol or denatured rum produced and used as provided by laws and regulations now or hereafter in force.

2 Medicinal preparations manufactured in accordance with formulas prescribed by the United States Pharmacopoeia, National Formulary or the American Institute of Homeopathy that are unfit for use for beverage purposes

3 Patented, patent, and proprietary medicines that are unfit for use for beverage purposes

4 Toilet, medicinal, and antiseptic preparations and solutions that are unfit for use for beverage purposes

5 Flavoring extracts and syrups that are unfit for use as a beverage or for intoxicating beverage purposes

6 Vinegar and preserved sweet cider

Provided, however, that any person who shall knowingly sell any of the articles mentioned in subdivisions one, two, three or four of this section for beverage purposes, or any extract or syrup for intoxicating beverage purposes, if the article, extract or syrup contains one-half of one per centum or more of alcohol by volume, shall be guilty of a violation of section twelve hundred and twelve and punishable accordingly

§ 1215 Register of permit 1 Every person holding a permit from the authorities of the United States under the national prohibition act shall, within thirty days after this article takes effect, and every person thereafter obtaining any such permit shall within ten days after obtaining

States, which he has registered under the provisions of this article, or the possession of such cider by such manufacturer of vinegar during the process of its development into vinegar

4 The temporary possession by a manufacturer of intoxicating liquor for the purpose of reducing the alcoholic content thereof so that before it is withdrawn from the factory or otherwise disposed of it shall contain less than one-half of one per centum of alcohol by volume, if such manufacturer is the holder of a permit from the proper authorities of the United States and such permit is registered as provided in this article

5 The possession, storage and removal of lawfully acquired liquor for personal consumption by the owner thereof, his family and bona fide guests, where such liquor was acquired by such owner before the seventeenth day of January, nineteen hundred and twenty. The burden of proof, however, shall be upon the owner, in any action concerning the same, to prove that such liquor was lawfully acquired, possessed and used

6 The purchase of sacramental wines by any minister, priest, rabbi, clergyman or officer of a religious society, or the acceptance, manufacture, possession or use in the state of such wines, or the delivery of such wines in the state or the acceptance thereof for delivery. The term "sacramental wines," as used herein, includes and means wines used for or in religious services

7 The purchase and sale of warehouse receipts covering intoxicating liquor on deposit in government bonded warehouses

§ 1214 Sale on a physician's prescription. Intoxicating liquor shall not be sold at retail for medical purposes except as follows

1 By a duly licensed pharmacist of the state of New York in good standing or a corporation, association or copartnership, a member or employee of which is a duly licensed pharmacist of the state of New York in good standing and in personal charge of the premises where such liquor is sold, upon the prescription of a duly licensed physician of the state of New York actively engaged in the practice of his profession

2 Not more than one pint of spirituous liquor to be taken internally shall be prescribed or sold under a physician's prescription for use by the same person within a period of ten days, and no such liquor shall be sold for external use until the same has been made unfit for internal use

3 No prescription shall be filled more than once

4 Any pharmacist filling a prescription shall at the time indorse upon it, over his signature, the word "canceled," together with the date when the liquor was delivered, and make the same a part of the record that he is required to keep as herein provided

5 The pharmacist shall permanently attach to the container of such liquor so sold a label stating the name and address of the person selling and purchasing such liquor, the name and address of the physician issuing the prescription and the date of such sale, and such label shall not be removed from such container until the contents of the container are entirely consumed

6 Every pharmacist who fills a prescription for such liquor shall keep a record, alphabetically arranged, in a book kept for that purpose, which record shall show the date of filling, amount and kind of liquor prescribed, to whom sold, the name of the physician issuing the prescription and the number of the prescription and prescription book. Such record shall be kept open to inspection by the district attorney or sheriff of the county or any magistrate or peace officer

§ 1214-a Prescription for intoxicating liquor. It shall not be lawful to issue a prescription for intoxicating liquor unless the person issuing the prescription is a physician duly licensed to practice medicine in the state of New York, and actively engaged in the practice of such profession, not unless he be the holder of a permit to prescribe liquor from the proper federal authorities, and no physician shall prescribe such liquor unless after careful examination of the person for whose use such prescription is sought, or, if such examination is found impracticable, then upon the best information obtainable, he in good faith believes that the use of such liquor as a medicine by such person is necessary and will afford relief to him from some known ailment.

§ 1214-b Records required. No person shall manufacture, purchase for sale, sell or transport any intoxicating liquor without making at the time a permanent record thereof showing in detail the amount and kind of such liquor manufactured, purchased, sold or transported, together with the names and addresses of the persons to whom sold, in case of sale, and the consignor and consignee in case of transportation. Such record shall at all times be open to inspection as in this article provided

§ 1214-c Transportation restrictions. No person shall use or induce any carrier, or any agent or employee thereof, to carry or ship any package or receptacle containing intoxicating liquor without notifying the carrier of the true nature and character of the shipment. No carrier shall transport nor shall any person receive such liquor from a carrier unless there appears on the outside of the package containing such liquor the following information

Name and address of the consignor or seller, name and address of the consignee, kind and quantity of such liquor contained therein

A consignee shall not accept nor receive any package containing any intoxicating liquor upon which there appears a statement known to him to be false, and no carrier nor other person shall consign, ship, transport or deliver any such package, knowing such statement to be false

No person shall give to any carrier or any officer, agent or person acting or assuming to act for such carrier an order requiring the delivery to any person of any intoxicating liquor or package containing such liquor consigned to, or purporting or claimed to be consigned to a person, when the purpose of the order is to enable any person not an actual bona fide consignee to obtain such liquor

§ 1214-d Illegal advertisements in respect of intoxicating liquor No person shall advertise anywhere, or by any means or method, intoxicating liquor, or the manufacture, sale, keeping for sale or furnishing of the same, or where, how, from whom or at what price the same may be obtained No one shall permit any sign or billboard containing such advertisement to remain upon one's premises But nothing in this section shall prohibit manufacturers and wholesale druggists holding permits to sell intoxicating liquor from furnishing price lists, with description of such liquor for sale, to persons permitted to purchase such liquor, or from advertising alcohol in business publications or trade journals circulating generally among manufacturers of lawful alcoholic perfumes, toilet preparations, flavoring extracts, medicinal preparations and like articles

§ 1214-e Unlawful utensils, et cetera, for manufacture No person shall advertise, manufacture, sell or possess for sale any utensil, contrivance, machine, preparation, compound, tablet, substance formula, direction or recipe advertised, designed or intended for use in the unlawful manufacture of intoxicating liquor

§ 1214-f Unlawful solicitation of orders No person shall solicit or receive, or knowingly permit his employee to solicit or receive, from any person any order for intoxicating liquor or give any information of how such liquor may be obtained in violation of this article

§ 1214-g Maintenance of place where violations are committed No person shall maintain any room, house, building, boat, vehicle, structure or place where intoxicating liquor is manufactured, sold, given away, kept or bartered in violation of this article, and all intoxicating liquor and property kept and used in maintaining the same is hereby declared to be a common nuisance, and any person who maintains such a common nuisance shall be guilty of a misdemeanor and upon conviction thereof shall be fined not more than one thousand dollars or be imprisoned for not more than one year or both

If a person has knowledge or reason to believe that his room, house, building, boat, vehicle, structure or place is occupied or used for the manufacture or sale of such liquor contrary to the provisions of this article, and suffers the same to be so occupied or used, such room, house, building, boat, vehicle, structure or place shall be subject to a lien for and may be sold to pay all fines and costs assessed against the person guilty of such nuisance for such violation, and any such lien may be enforced by action in any court having jurisdiction

§ 1214-h Possession or taking orders in violation of article. No person shall, with intent to effect a sale of intoxicating liquor by himself, his employee, servant or agent, for himself or any person, company or corporation, keep or carry around on his person, or in a vehicle, or other conveyance whatever, or leave in a place for another to secure, any intoxicating liquor, or travel to solicit, or solicit, or take, or accept orders for the sale, shipment or delivery of intoxicating liquor, in violation of this article

§ 1214-i Non beverage preparations The articles enumerated in this section after having been manufactured and prepared for the market, shall not be subject to the provisions of this article, if they correspond with the following descriptions and limitations, namely

1 Denatured alcohol or denatured rum produced and used as provided by laws and regulations now or hereafter in force

2 Medicinal preparations manufactured in accordance with formulas prescribed by the United States Pharmacopoeia, National Formulary or the American Institute of Homeopathy that are unfit for use for beverage purposes

3 Patented, patent, and proprietary medicines that are unfit for use for beverage purposes

4 Toilet, medicinal, and antiseptic preparations and solutions that are unfit for use for beverage purposes

5 Flavoring extracts and syrups that are unfit for use as a beverage or for intoxicating beverage purposes

6 Vinegar and preserved sweet cider

Provided, however, that any person who shall knowingly sell any of the articles mentioned in subdivisions one, two, three or four of this section for beverage purposes, or any extract or syrup for intoxicating beverage purposes, if the article, extract or syrup contains one-half of one per centum or more of alcohol by volume, shall be guilty of a violation of section twelve hundred and twelve and punishable accordingly

§ 1215 Register of permit. 1 Every person holding a permit from the authorities of the United States under the national prohibition act shall, within thirty days after this article takes effect, and every person thereafter obtaining any such permit shall within ten days after obtaining

the same, exhibit or cause to be exhibited such permit to the county clerk of the county in which he resides if he be a resident of the state, and if he be a nonresident with the secretary of state, and at the same time deliver a true copy thereof to such officer. Such officer shall keep a record of such permits and register therein the name and address of each person to whom such a permit is issued, the date of the permit, the date of its expiration, and a brief description of the nature of the permit, and shall file such copy in his office. Upon the suspension or revocation of any such permit, the person to whom such permit was issued shall, within five days after such suspension or revocation takes effect, serve upon the officer by whom such registration is made, either personally or by mail, a written notice of such suspension or revocation, which shall be noted by such officer on such record. The officer shall be entitled to collect a fee of one dollar for making the registration provided for in this section. Such register and copies of permits filed as herein provided shall be open to public inspection at all times during office hours.

2 The permit referred to in subdivision one of this section means what is commonly known as the "basic" permit and does not include a subsidiary or installment permit, for a particular transaction, issued to the holder of the basic permit, but any other provision of this article which refers to a permit, except as to the registration thereof, shall be deemed to mean each and every permit required by act of congress to authorize the transaction to which such provision relates.

§ 1216 Possession as evidence, burden of proof. The possession of liquors by any person not legally permitted under this article to possess liquor shall be prima facie evidence that such liquor is kept for the purpose of being sold, bartered, exchanged, given away, furnished or otherwise disposed of in violation of the provision of this article, and the burden of proof shall be upon the possessor in any action concerning the same to prove that such liquor was lawfully acquired, possessed and used.

§ 1217 Injunction proceedings. 1 A person who shall maintain a common nuisance, as defined by section twelve hundred and fourteen-g of this chapter, may be enjoined from maintaining such nuisance in the manner prescribed in this section. The attorney-general or the district attorney of the county in which the nuisance is maintained may present a verified petition to a justice of the supreme court or a special term of the supreme court of the judicial district in which such county is situated, or the county court or judge of such county, for an order enjoining the maintenance of such nuisance. Such petition shall state the facts upon which such application

is based. Upon the presentation of the petition the justice, judge or court shall grant an order requiring such person to appear before such justice, judge or court, or before a special term of the supreme court of the judicial district, on the day specified therein not more than ten days after the granting thereof, to show cause why such person should not be permanently enjoined from maintaining the nuisance, describing it. A copy of such petition and order shall be served upon the person, in the manner directed by such order not less than five days before the return day thereof. On the day specified in such order, the justice, judge or court before whom the same is returnable shall hear the proofs of the parties and may, if deemed necessary or proper, take testimony as to the allegations of the petition. If the judge, justice or court is satisfied that such person maintains a common nuisance as defined by this article and as alleged in the petition, an order shall be granted enjoining such person thereafter from maintaining such nuisance. It shall not be necessary for the court or judge to find that the property involved was being unlawfully used at the time of the hearing. On finding that the material allegations of the petition are true the court shall order that no intoxicating liquor shall be manufactured, sold, bartered or stored in the room, house, building, boat, vehicle, structure or place to which the proceeding relates, or any part thereof. The court or judge also may order that such room, house, building, structure, boat, vehicle, or place shall not be occupied or used for one year thereafter, or that it shall not be occupied or used during such period for other than dwelling purposes exclusively, or the court, in its discretion, may permit it to be occupied or used for any lawful purpose if the owner, lessee, tenant or occupant thereof shall give bond, with sufficient surety to be approved by the judge or court making the order, in the penal and liquidated sum of not less than five hundred dollars nor more than one thousand dollars payable to the people of the state and conditioned that intoxicating liquor will not thereafter be manufactured, sold, bartered, kept or otherwise disposed of therein or thereon and that he will pay all fines, costs and damages that may be assessed for any violation of the provisions of this article upon such property. A violation of the order made in such proceeding, after such service thereof or of notice of entry as the court or judge may direct, is a contempt of court, punishable as provided in the judiciary law. Costs upon the application for such injunction may be awarded in favor of and against the parties thereto in such sums as in the discretion of the justice, judge or court may seem proper. No bond shall be required to institute any proceeding under this section.

2 Any person who shall with intent to effect a sale of liquor, by himself, employee, servant or agent, for himself or any person, company or corporation, keep or carry around on his person, or in a vehicle or other conveyance whatever or leave at any place for another to secure any intoxicating liquor or who shall travel to solicit or solicit, or take or accept orders for the sale shipment or delivery of liquor in violation of the provisions of this article also may be enjoined, in a proceeding taken as provided in subdivision one of this section, from doing or continuing to do any of such acts or things. In a proceeding under this subdivision it shall not be necessary to show any intention on the part of the accused to continue such violations if the proceeding is brought within sixty days after they occurred

§ 1218 Penalties Any person violating any provision of this article for which a penalty has not been specifically provided herein, shall upon conviction for the first offense be punished by a fine of not more than five hundred dollars and upon conviction for a second offense shall be punished by a fine of not less than one hundred dollars nor more than one thousand dollars, or imprisonment for not more than ninety days, and for any subsequent offense by a fine of not less than five hundred dollars and imprisonment for not less than three months nor more than two years

§ 1219 No double jeopardy No prosecution for the violation of any provision of this article shall lie where the person or persons against whom the charge is made has or have been convicted or acquitted upon a charge embracing the same act or acts in a United States court

§ 2 This act shall take effect immediately

*Comment* Comment is invited from the members of the State Society to be sent to the Legislative Bureau, and if none are received in opposition to the bill it will be dropped

---

Senate Int No 114 (conc Assembly 221)  
—A bill introduced in the Senate by Senator Ernest E. Cole of Steuben County, concurrent Assembly Int No 221, introduced in the Assembly by Assemblyman John Boyle, Jr. of Suffolk County, would amend Chapter 187, Laws of 1924, by extending to March 15, 1925, time of commission on crippled children to report to Legislature

Referred to Finance Committee

January 28, 1925 Reported

No 114

Int 114

IN SENATE,

January 15, 1925

Introduced by Mr. Cole—read twice and ordered printed, and when printed to be committed to the Committee on Finance

#### AN ACT

To amend chapter one hundred and eighty-seven of the laws of nineteen hundred and twenty-four, entitled "An act to create a temporary commission to inquire into and report upon the number, distribution and condition of crippled children throughout the state, to recommend means more adequately to meet their needs and making an appropriation therefor," in relation to the time of making report

*The People of the State of New York, represented in Senate and Assembly do enact as follows:*

Section 1 Section five of chapter one hundred and eighty-seven of the laws of nineteen hundred and twenty-four, entitled "An act to create a temporary commission to inquire into and report upon the number, distribution and condition of crippled children throughout the state, to recommend means more adequately to meet their needs, and making an appropriation therefor," is hereby amended to read as follows

§ 5 The commission shall make a report of its proceedings, together with its recommendations, to the legislature on or before the fifteenth day of March [February], nineteen hundred and twenty-five, and may accompany its report with such proposed legislative measures to carry its recommendations into effect, as to the commission may seem proper

§ 2 This act shall take effect immediately

*Comment* It will be remembered that last year no comment was made upon this bill because it was thought that courtesy would be shown the medical profession in the appointment of an active practicing physician upon the commission, and yet when the commission was appointed no physician was placed thereon

Your Committee on Legislation would take the position that on such a commission a physician engaged in active practice should be appointed as it might be construed that the physicians of this State had been inactive in their desire and care of the crippled children of the State and had left it to lay people to recommend means more adequate to meet their needs, whereas past legislation will have shown that the medical men of this State have always been active in initiating and forwarding bills of like nature and have been invited to participate in such measures

Unless comment or request is received from the members of the Society the bill will be dropped

## THE NARCOTIC BILL.

Senate Int No 115 (conc Assembly Int 215)  
—A bill introduced in the Senate by Senator Morton J Kennedy of New York, concurrent Assembly Int 215, by Assemblyman Morris Weinfeld of New York, would add new article 22, and amend section 4-b, Public Health Law, and repeals section 1746, Penal Law, relative to habit forming drugs

Referred to Public Health Committees of both Houses

*Comment* Reference is made in relation to this bill, to page 402 of the State Society Journal of March 21, 1924, which bill now introduced is the same as was introduced last year, and after a conference with all concerned, was satisfactorily drawn in relation to its medical features

The bill this year is exactly the same as last year, being virtually word for word throughout, and has omitted the obnoxious features which the physicians fought against. Your Committee on Legislation would now take the stand, as it finally took last year, in favor of this bill, unless County Societies take action to the contrary

Senate Int No 116 (conc Assembly Int 216)  
—A bill introduced in the Senate by Senator Morton J Kennedy of New York, concurrent Assembly Int 216, by Assemblyman Morris Weinfeld of New York, would add new section 177, Insanity Law, requiring the licensing of private institutions for treatment of narcotic drug addiction

Referred to General Laws Committee of Senate, and to Judiciary Committee of Assembly

No 116

Int 116

IN SENATE,

January 15, 1925

Introduced by Mr Kennedy—read twice and ordered printed, and when printed to be committed to the Committee on General Laws

## AN ACT

To amend the insanity law, in relation to licensing private institutions for the treatment of narcotic drug addiction.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Chapter thirty-two of the laws of nineteen hundred and nine, entitled "An act in relation to the insane, constituting chapter twenty-seven of the consolidated laws," is hereby amended by adding thereto a new section, to be section one hundred and seventy-seven, to read as follows

§ 177 Private institutions for the treatment of narcotic drug addiction No person, association or corporation shall establish or keep an institu-

tion for the care, custody or treatment for compensation or otherwise of any person for the habit of taking or using any narcotic drugs, including cocaine, opium, morphine, codeine, diacetyl morphine (heroin), cannabis indica, cannabis sativa, or any compound, manufacture, salt, derivative or preparation of any of them or any synthetic substitute of any of them identical in chemical composition, unless such institution holds a license for such purposes issued by the commission Every application for such a license shall be accompanied by a plan of the premises proposed to be occupied, describing the capacity of the buildings for the uses intended, the extent and location of grounds appurtenant thereto, and the number of patients proposed to be received therein, with such other information and in such form, as the commission may require The commission shall not grant any such license without first having made an examination of the premises proposed to be licensed, and being satisfied that they are substantially as described, and are otherwise fit and suitable for the purposes for which they are designed to be used, and that such license should be granted The commission may at any and all times, examine and ascertain how far a licensed institution is conducted in compliance with the license therefor, and after due notice to the institution and opportunity for it to be heard, the commission having made a record of the proceeding upon such hearing, may, if the interest of the inmates of the institution so demand, for just and reasonable cause then appearing and to be stated in its order, amend or revoke any such license by an order to take effect within such time after the service thereof upon the licensee, as the commission shall determine Any determination of the commission in respect to the revocation of a license shall be reviewable under certiorari proceedings by the supreme court or a justice therein instituted in the judicial district in which such institution is located Violation of the provisions of this section shall constitute a misdemeanor, punishable on conviction by a fine of not less than one hundred dollars and not more than five hundred dollars or by imprisonment for not less than sixty days or more than one year or by both such fine and imprisonment The commission shall have power and authority over all such institutions as provided in this chapter in relation to private institutions for the insane

§ 2 This act shall go into effect on the first day of January, nineteen hundred and twenty-six, except that applications for licenses may be made to the commission and the commission may make all necessary examinations and grant such licenses from the date on which this act becomes a law

*Comment* This bill in printed in full inasmuch as it has to do with the new matter and touches upon any person, association or corporation which establishes or keeps an institution for the care, custody or treatment, etc., of persons taking or using narcotic drugs known as habit forming, after such habit is formed

Attention of members of the State Society who may be proprietors, superintendents or members of boards of institutions of such nature, as well as lay boards of hospital committees, is called to the bill, though your Committee on Legislation is of the opinion that the bill is a good one and, taken in conjunction with the previous bill, as commented on, in relation to the habit forming drugs, should be accepted and helped in its passage by the medical profession

THE STATE DEPARTMENT OF EDUCATION AMENDING  
THE MEDICAL PRACTICE ACT

Senate Int No 211 (conc Assembly Int 307)  
—A bill introduced in the Senate by Senator John L. Karle of Queens County, concurrent Assembly Int No 307, introduced in the Assembly by Assemblyman Russell Dunmore of Oneida County, would amend sections 164, 169, 170, 173, 174 and repeal section 171, Public Health Law, relative to practice of medicine, by providing among other things for the registration and licensing of physicians

Referred to Public Health Committees of both Houses

*Comment* Now that the bill is in print, we would ask that comment, criticism and suggestions be forwarded to the Legislative Bureau, that we may have them on hand for reference

Senate Int No 263—A bill introduced in the Senate by Senator James A. Higgins of Kings County, would amend section 81, Insanity Law relative to qualifications of examiners in lunacy

Referred to General Laws Committee

No 266.

Int 263

IN SENATE,

January 23, 1925

Introduced by Mr. Higgins—read twice and ordered printed, and when printed to be committed to the Committee on General Laws

AN ACT\*

To amend the insanity law, in relation to qualifications of examiners in lunacy

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section eighty-one of chapter thirty-two of the laws of nineteen hundred and nine, entitled "An act in relation to the insane," con-

stituting chapter twenty-seven of the consolidated laws, as last amended by chapter six hundred and seventy-three of the laws of nineteen hundred and twenty-one, is hereby amended to read as follows

§ 81 Medical examiners in lunacy, certificates of lunacy The certificate of lunacy must show that such person is insane and must be made by two reputable physicians *who have filed with the commission a certified copy of the certificate of a judge of a court of record showing qualifications in accordance with law* The qualifications of medical examiners in lunacy *certified after date from which this act shall take effect shall be that he or she must be a reputable physician, graduate of an incorporated medical college, who has been in actual practice of his or her profession at least three years, and shall have at least two years actual experience in the care and treatment of the insane in an institution for the insane* [graduates of an incorporated medical college, who have been in the actual practice of their profession at least three years, and have filed with the commission a certified copy of the certificate of a judge of a court of record, showing such qualifications in accordance with forms prescribed by the commission]

Such physicians shall jointly make a final examination of the person alleged to be insane within ten days next before and inclusive of the date of the granting of the order The date of the certificate of lunacy shall be the date of such joint examination Such certificate of lunacy shall be in the form prescribed by the commission, and shall contain the facts and circumstances upon which the judgment of the physicians is based and show that the condition of the person examined is such as to require care and treatment in an institution for the care, custody and treatment of the insane

Neither of such physicians shall be a relative of the person applying for the order, or of the person alleged to be insane, or a manager, superintendent, proprietor, officer, stockholder, or have any pecuniary interest, directly or indirectly, or be an attending physician in the institution, to which it is proposed to commit such person

§ 2 This act shall take effect immediately

\* Matter in *italics* is new matter in brackets [ ] is old law to be omitted.

*Comment* Attention is called to the matter printed in caps which is the new portion of the bill and to the fact that hereafter should the bill become law no one can hold the position of medical examiner in lunacy unless he or she shall have had at least two years actual experience in the care and treatment of the insane in an institution for the insane

While this will limit sharply hereafter an examination in lunacy to those who follow such a specialty, it is to be surmised that the protection of the public will be the greater conserved

lation, as last year, feels that the Society should be in favor of such a measure, and unless comment or criticism is offered on the part of the members of the State Society, the bill will be dropped

Senate Int No 266—A bill introduced in the Senate by Senator James S Truman of Owego N Y, would amend subdivision 9, section 15, Workmen's Compensation Law, by providing for expenses for rehabilitating injured employees, not more than \$10 per week to be spent for maintenance

Referred to Labor and Industry Committee

*Comment* Unless comment or suggestion is received from the members of the Society in regard to the above mentioned bill it will be dropped

Senate Int No 278 (conc Assembly Int 414)—A bill introduced in the Senate by Senator George L Thompson of Kings Park, N Y, concurrent Assembly Int 414, introduced in the Assembly by Assemblyman Edwin W Wallace of Nassau County, would amend section 56 Criminal Code, by giving Special Sessions Courts jurisdiction in cases of wilful violation to comply with lawful order of local health board or officer, where penalty does not exceed \$50 nor imprisonment six months

Referred to Codes Committee of both houses

No 282

Int 278

IN SENATE,

January 26, 1925

Introduced by Mr Thompson—read twice and ordered printed, and when printed to be committed to the Committee on Codes

#### AN ACT

To amend the code of criminal procedure, in relation to jurisdiction of courts of special sessions

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section fifty-six of the code of criminal procedure is hereby amended by adding at the end a new subdivision, to be subdivision forty, to read as follows

40 For a wilful violation or refusal or omission to comply with any lawful order or regulation prescribed by any local board of health or local health officer where the penalty prescribed does not exceed fifty dollars nor the imprisonment six months

§ 2 This act shall take effect July first, nineteen hundred and twenty-five

*Comment* This bill is the same, word for word, as Senate Int No 455, noted on page 174 of the February 15, 1924, issue of the State Society Journal, and your Committee on Legis-

Senate Int No 282 (conc Assembly Int 413)—A bill introduced in the Senate by Senator George L Thompson of Kings Park, N Y, concurrent Assembly Int 413, by Assemblyman Edwin W Wallace of Nassau County, would amend section 21, Public Health Law, by empowering local health board to prescribe that a person wilfully violating or omitting to comply with any lawful order or regulation prescribed by it or a local health officer shall be guilty of a misdemeanor

Referred to Public Health Committees of both Houses

No 286

Int 282

IN SENATE,

January 26, 1925

Introduced by Mr Thompson—read twice and ordered printed, and when printed to be committed to the Committee on Public Health

#### AN ACT\*

To amend the public health law, in relation to violations of rules or orders of local boards of health

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section twenty-one of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituted chapter forty-five of the consolidated laws, as last amended by chapter five hundred and fifty-nine of the laws of nineteen hundred and thirteen, is hereby amended to read as follows

§ 21 General powers and duties of local boards of health Every such local board of health shall meet at stated intervals to be fixed by it, in the municipality The presiding officer of every such board may call special meetings thereof when in his judgment the protection of the public health of the municipality requires it, and he shall call such meeting upon the petition of at least twenty-five residents thereof, of full age, setting forth the necessity of such meeting Every such local board, subject to the provisions of the public health law and of the sanitary code, shall prescribe the duties and powers of the local health officer, who shall be its chief executive officer, and direct him in the performance of his duties, and fix his compensation, which in case of health officers of cities, towns and villages, having a population of eight thousand or less, shall not be less than the equivalent of ten cents per annum per inhabitant of the city, town or

village according to the latest federal or state enumeration, and in cities, towns and villages having a population of more than eight thousand shall not be less than eight hundred dollars per annum. In addition to his compensation so fixed, the board of health must allow the actual and reasonable expenses of said health officer in the performance of his official duties and in going to, attending or returning from, the annual sanitary conference of health officers or equivalent meeting, held yearly within the state, and conferences called by the sanitary supervisor of the district, and whenever the services rendered by its health officer shall include the care of smallpox, the board of health shall allow, or whenever such services are extraordinary, by reason of infectious diseases, or otherwise, they may, in their discretion, allow to him such further sum in addition to said fixed compensation as shall be equal to the charges for consultation services in the locality, audited by the town board of a town, by the board of trustees of a village or by the proper auditing board of a city of the third class, which said expenses and said additional compensation shall be a charge upon and paid by the municipality as provided in section thirty-five of this chapter. Every such local board shall make and publish from time to time all such orders and regulations, not inconsistent with the provisions of the sanitary code, as it may deem necessary and proper for the preservation of life and health and the execution and enforcement of this chapter in the municipality. It shall make without publication thereon, such orders and regulations for the suppression of nuisances and concerning all other matters in its judgment detrimental to the public health in special or individual cases, not of general application, and serve copies thereof upon the owner or occupant of any premises whereon such nuisances or other matters may exist, or upon which may exist the cause of other nuisances to other premises or cause the same to be conspicuously posted thereon. The health officer may employ such persons as shall be necessary to enable him to carry into effect the orders and regulations of the board of health and the provisions of the public health law and of the sanitary code, and fix their compensation within the limits of the appropriation therefor. The board of health may issue subpoenas, compel the attendance of witnesses, administer oaths to witnesses and compel them to testify, and for such purposes it shall have the same powers as a justice of the peace of the state in a civil action of which he has jurisdiction. It may designate by resolution one of its members to sign and issue such subpoenas. No subpoena shall be served outside the jurisdiction of the board issuing it, and no witness shall be interrogated or compelled to testify upon matters not related to

the public health. It may issue warrants to any constable or policeman of the municipality to apprehend and remove such persons as cannot otherwise be subjected to its orders or regulations, and a warrant to the sheriff of the county to bring to its aid the power of the county whenever it shall be necessary to do so. Every warrant shall be forthwith executed by the officer to whom directed, who shall have the same powers and be subject to the same duties in the execution thereof, as if it had been duly issued out of a court of record of the state. Every such local board may prescribe and impose penalties for the violation of or failure to comply with any of its orders or regulations, not exceeding one hundred dollars for a single violation or failure, to be sued for and recovered by it in the name and for the benefit of the municipality, and may maintain actions in any court of competent jurisdiction to restrain by injunction such violations or otherwise to enforce such orders and regulations. *Every such local board of health may prescribe that a person who wilfully violates or refuses or omits to comply with any lawful order or regulation prescribed by it or a local health officer, shall be guilty of a misdemeanor punishable by a fine not exceeding fifty dollars or imprisonment not exceeding six months, and a court of special sessions in the territory over which such local board has jurisdiction shall have jurisdiction of such misdemeanor.*

§ 2 This act shall take effect July first, nineteen hundred and twenty-five

\* Matter in *italics* is new matter in brackets [ ] is old law to be omitted

*Comment* Unless there be amendments to this bill, it will be dropped

Senate Int No 283 (conc Assembly Int 399) —A bill introduced in the Senate by Senator J Griswold Webb of Clinton Corners, N Y., concurrent Assembly Int. 399, by Assemblyman Frank H Lattin of Orleans County, would amend section 12, County Law, by authorizing county supervisors to provide expenses for public health nurses, who shall work under the public health committee or board providing for appointment of advisory committee of citizens and relative to duties of nurses

Referred to Internal Affairs Committee of both Houses

*Comment* Your Committee on Legislation requests careful study of this bill by the Presidents and Comitia Minora of the County Societies throughout the State in relation to its provisions

Further comment will be forthcoming when we have heard from the individual members of the Society in regard to the measure

Senate Int No 302 (conc Assembly Int 748)  
—A bill introduced in the Senate by Senator Ernest E Cole of Bath, N Y, concurrent Assembly Int 748, by Assemblyman Irving F Rice of Cortland County, would amend sections 571, 571-a, 572, 575, Education Law, relative to medical inspection and health service in public schools

Referred to Public Education Committees of both Houses

*Comment* Will be made later

Senate Int No 308 (conc Assembly Int 386)  
—A bill introduced in the Senate by Senator James S Truman of Owego, N Y, concurrent Assembly Int 386, by Assemblyman Chas P Miller, of Genesee County, would add new article 4-a, Workmen's Compensation Law, relative to fibroid phthisis

Referred to Labor and Industry Committees of both Houses

*Comment* Unless criticism or request that this bill be carried in received from the members of the Society, the bill will be dropped

Senate Int No 349—A bill introduced in the Senate by Senator John L Karle of Queens County, would amend section 21, Public Health Law, relative to powers and duties of local health boards

Introduced by Mr. Karle—(by request)—read twice and ordered printed, and when printed to be committed to the Committee on Public Health

# AN ACT

To amend the public health, in relation to records and reports of vaccinations

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section three hundred and eleven of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," as last amended by chapter twenty-five of the laws of nineteen hundred and twenty-four, is hereby amended to read as follows

§ 311 Vaccination how made, reports 1 No person shall perform vaccination for the prevention of smallpox who is not a regularly licensed physician under the laws of the state Vaccination shall be performed in such manner only as shall be prescribed by the state commissioner of health

2 No physician shall use vaccine virus for the prevention of smallpox unless such vaccine virus is produced under license issued by the secretary of the treasury of the United States [and is accompanied by] or under a certificate of approval issued by the state commissioner of health, and such vaccine virus shall then be used only within the period of time specified [in such approval] by the expiration date

3 Every physician performing a vaccination shall within ten days make a report to the local health officer upon a form furnished by the state commissioner of health setting forth the full name and age of the person vaccinated and, if such person is a minor, the name and address of his parents, the date of vaccination, the date of previous successful vaccination if possible, the name of the maker of the vaccine virus, the lot or batch number of such vaccine virus and whether upon re-examination after a proper

interval such vaccination was found to be successful or non-successful

4 Every local health officer shall retain in the files and records of his office every report of a vaccination reported to him under the provisions of the preceding paragraph and shall report once in each month to the state department of health the number of vaccinations reported to him during the preceding month, together with the number of those which were successful and the number unsuccessful. Such report shall be made in such manner as shall be prescribed by the state commissioner of health

§ 2 This act shall take effect immediately

EXPLANATION—Matter in *italics* is new matter in brackets [ ] is old law to be omitted

*Comment* This bill is favored by your Committee on Legislation, and unless there be amendments thereto we will not make any further comment thereon

Senate Int No 380 (conc Assembly Int 570)—A bill introduced in the Senate by Senator Daniel J Farrell of Kings County, concurrent Assembly Int 570, by Assemblyman Gerald F Dunne of Kings County, would amend section 13 Workmen's Compensation Law, relative to medical and surgical attendance of injured employees, by providing employee shall select physician

Referred to Labor and Industry Committee of both Houses

*Comment* This is the bill which many of the members of the medical profession have been desirous of seeing introduced and which your Committee in years past has been directed to work for

Unless there be opposition to such a bill from the members of the medical profession, your Committee will work upon the theory that the profession still desires it to try and have passed such an amendment

#### THE DRUGLESS PRACTITIONER BILL.

Senate Int No 473—A bill introduced in the Senate by Senator Leonard W H Gibbs of Erie County, would add new article 13-a, Public Health Law, relative to practice of all systems or sciences constructed or developed for treatment of disease and the removal of abnormality, injury or deformity of human beings except practice of medicine, osteopathy and Christian Science

  - 285-n Transfer of registration
  - 285-o Exceptions
  - 285-p Specific violations
  - 285-q Prohibitions
  - 285-r Recognition of license

§ 285 Definitions As used in this article  
1 "University" means University of the State of New York

2 "Regents" means Board of Regents of the University of the State of New York

3 "Board" means a board of examiners of drugless practitioners of the state of New York

4 "Examiner" means a member of a board of examiners of drugless practitioners of the State of New York

5 "Drugless methods" means the treatment of disease, the removal of abnormality, injury or deformity of human being by hand or mechanically without the use of drugs, osteopathy, surgery, or christian science

§ 285-a Qualifications to practice No person shall practice drugless methods unless licensed and registered as required by this article nor shall any person practice drugless methods who has ever been convicted of a felony

by any court, or whose authority to practice is suspended or revoked by the regents on recommendation of the State Board

§ 285-b Board of Examiners The State Board of Examiners of drugless practitioners is hereby created, to consist of five members who shall be appointed by the regents. The first board shall be selected from not less than fifteen names of drugless practitioners who shall have practiced in the state of New York for the past five years prior to the passing of this act and who shall be nominated by the society or societies of drugless practitioners incorporated under the laws of this State. The members of the first board shall be appointed for one, two, three, four and five years respectively and shall consist of persons of full age, residents of the State of New York, holding diplomas or degrees from legally incorporated schools or colleges of drugless methods. After the appointment of the first board, members shall be appointed from the list of regularly licensed and registered drugless practitioners and shall hold office for a term of five years and until their successors shall be appointed. The regents shall fill any vacancies, however occurring, during the term of any members thereof.

§ 285-c Organization of board very examiner shall receive a certificate of appointment from the regents and, before beginning his term of office, shall file with the secretary of state his constitutional oath of office. The board or any committee thereof, may take testimony and proofs concerning any matter within its jurisdiction. It shall elect proper officers and may subject to the regents' approval, make by-laws and rules not inconsistent with law, needed in performing its duties.

§ 285-d Compensation of examiners From the fees provided by this article, the board may pay all proper expenses, incurred by its provisions and each examiner shall receive a fee of ten dollars for each day and mileage while engaged in the performance of his official duties.

§ 285-e Application and fee for examination The board shall admit to examination any candidate who, not later than ten days before the date set for such examination, pays the fee of twenty-five dollars and submits to it satisfactory evidence verified by oath, if required that he or she,

1 Is more than twenty-one years of age  
2 Is of good moral character, as evidenced by the affidavit of four residents of the county in which said applicant resides

3 A citizen of the United States or has declared his or her intention of becoming such citizen

4 Has passed regents examinations aggregating at least seventy-two counts

5 Has graduated from a legally incorporated school or college of drugless methods giving not less than a three years' residence course consisting of two thousand sixty-minute hours, and graduated therefrom shall be deemed eligible for examination. Eighteen months after this act takes effect such graduation shall be from a school or college of drugless methods which shall give not less than four academic years of six months each, consisting of twenty-four hundred sixty-minute hours.

§ 285-f Subjects of examination Every member of the board shall submit to the regents as required, lists of questions covering the subjects of anatomy, physiology, pathology, toxicology, biology, histology, hygiene, physiological chemistry, sanitation according to drugless methods, bacteriology, symptomatology, dietetics and physical diagnosis. From these lists, the regents shall prepare question papers for all those subjects, which, at any examination, shall be the same for all candidates.

§ 285-g Examinations Examinations for license shall be held at least twice annually, and more often in the discretion of the regents and at such places as they shall direct, and shall be exclusively in writing and in English. Each examination shall be conducted by a regents examiner who shall not be a member of the drugless practitioner board of examiners. At the close of each examination the regent's examiner in charge shall deliver the question and answer papers to the board or its duly authorized committee, and such board shall, without unnecessary delay, examine and mark the papers and transmit to the regents an official report, signed by its president and secretary, stating the standing of each candidate in each branch and his general average. Such reports shall include the questions and answers and be filed in the public records of the university. To entitle the applicant to a license he must pass the examination with an average of at least seventy-five per centum. If a candidate fails in his examination he may, after not less than six months' further study, have a second examination without fee.

§ 285-h License after examination On receiving from the State Board an official report that the candidate has successfully passed the examination, and is recommended for license the regents shall issue to him a license to practice drugless methods. Each license shall be issued by the university under seal and shall be signed by each acting member of the board of drugless practitioner examiners, and shall be numbered, and shall state that the licensee has given satisfactory evidence of fitness as to age, moral character, education and other matters required by law, and that, after full examination, he or she has been licensed to practice.

§ 285-1 License without examination Any person twenty-one years of age, and who is of good moral character, as evidenced by affidavit of four reputable residents of the county in which he reside, and who, for at least two years prior to the passage of this act, has practiced drugless methods exclusively, and has a diploma from a legalized incorporated school or college of drugless methods, may, within one month after this act goes into effect, without examination and upon payment of the sum of twenty-five dollars to the board, and upon such further evidence as the board may require, receive from the board a certificate, which, when presented to the regents, shall entitle such person to a license to practice drugless methods as though such examination had been tried and successfully passed and been certified to the regents

§ 285-j Students of legalized school Students who are enrolled for a two-year course prior to the passing of this act, upon completion of such two year course in legalized incorporated school of drugless methods shall be eligible for the examination

§ 285-k Registration of license very license to practice drugless methods shall, before the licensee begins practice thereunder be registered in a book to be known as the "drugless practitioner register," which shall be provided and kept in the office of the clerk of the county where such practice is to be carried on, with name, residence, place and date of birth, source, number and date, of license An affidavit of the above facts and that he or she is the person named in such license, and had, before receiving the same, complied with all requirements of law and the rules of the university in connection with the conferment thereof and that no fraud, misrepresentation or mistake in any material regard was employed by anyone or incurred in order that such license might be conferred shall be filed with such clerk at the time of such registration Every license shall before registering, be exhibited to the county clerk, who, in case it is under seal by the regents, shall endorse or stamp thereon the date and his name preceded by the words "registered as authority to practice drugless methods in the clerk's office \* \* \* county" The clerk shall thereupon give to every drugless practitioner so registered a transcript of the entries in the register, with a certificate under seal that he has filed the prescribed affidavit. The licensee shall pay the county clerk a total fee of one dollar for such registration, affidavit and certificate

§ 285-l Hearing and decision of charges If any practitioner of drugless methods be charged under oath before the board with unprofessional or immoral conduct, or with gross ignorance, or inefficiency in his profession, the board shall notify him to appear before it at an appointed time and place, with counsel if he so desires, to

answer said charges, furnishing to him a copy thereof Upon the report of the board that the accused has been guilty of unprofessional or immoral conduct, or that he is grossly ignorant or inefficient in his profession, the regents may suspend the person so charged from practice for a limited season, or may revoke his license Upon the revocation of any license, the fact shall be noted upon the records of the regents and the license shall be marked as cancelled, of the date of its revocation Upon presentation of a certificate of such cancellation to the clerk of any county wherein the licensee may be registered, said clerk shall note the date of the cancellation on the register of drugless practitioner and cancel the registration A conviction of felony shall forfeit a license to practice drugless methods, and upon presentation to the regents or a county clerk by any public officer or officer of drugless method society of a certified copy of a court record of license and clerk's register, and the license and registration shall be marked "cancelled" Any person who after convicted of felony shall practice drugless methods in this state, shall be subject to all the penalties prescribed for the unlicensed practice of drugless methods, providing that if such conviction be subsequently reserved upon appeal and the accused acquitted or discharged, his license shall become again operative from the date of such acquittal or discharge

§ 285-m Limitation of license Every duly licensed and registered drugless practitioner shall be entitled to practice only that method or methods which his diploma or diplomas shall designate, and shall at all times have posted and exposed in a conspicuous place in his or her office his or her license and certificate of registration, nor shall he use any other title or degree except the one his or her diploma calls for

§ 285-n Transfer of registration A practicing drugless practitioner having registered a lawful authority to practice in one county, and removing such a practice or part thereof to another county, or regularly engaging in practice or conducting an office in another county, shall show, or send by registered mail, to the clerk of such other county, his or her certificate of registration The clerk of such other county, on payment of a fee of one dollar (\$1) thereof, shall stamp or indorse upon such certificate the date and his name, preceded by the words "Registered also in \_\_\_\_\_ County," and return the certificate to the applicant

§ 285-o Exceptions This article shall not be construed to effect doctors of medicine, osteopaths or others legally entitled to practice their particular profession or business, turkish baths, their managers and operators, or persons giving gratuitous services in cases of emergency, or any drugless practitioner practicing in one county and

duly registered therein and called to attend isolated cases in another county, but not residing or habitually practicing therein

§ 285-p Specific violations Every person who shall practice drugless methods within this State without lawful registration, or in violation of the provisions of this act, shall forfeit to the county wherein such person shall so practice, or in which any violation of the provisions of this act is committed, fifty dollars (\$50) for every day of such unlawful practice, and the district attorney may bring an action in the name of such county for the collection of such penalties, and the expense incurred in such prosecution, which shall be paid into the county treasury Any person who shall practice drugless methods under a false or assumed name, or who shall falsely impersonate another practitioner of a like or different name, shall be guilty of a felony, and any person guilty of violating any of the other provisions of this article, or who shall buy, sell or fraudulently obtain any drugless method diploma, license or record of registration, or who shall aid, abet or knowingly assist in such buying, selling or fraudulently obtaining, or who shall practice drugless methods under the cover of a diploma or license illegally obtained or signed or issued unlawfully under fraudulent misrepresentation, or who, after conviction of a felony shall attempt to practice drugless methods, and any person who shall, without having been authorized to do so legally, append a drugless practitioner title to his or her name, or shall assume or advertise that he or she is lawful practitioner of drugless methods, shall be guilty of a misdemeanor and, on conviction thereof, shall be punished by a fine of not less than two hundred and fifty dollars or imprisonment of six months for the first offence, and on conviction of a subsequent offense by a fine of not less than five hundred dollars or imprisonment for not less than a year, or both fine and imprisonment

§ 285-q Prohibitions All licensed drugless

practitioners are hereby forbidden to administer drugs or practice surgery or obstetrics

§ 285-r Recognition of license Licensed drugless practitioners shall have the right to practice in public and private hospitals and other institutions in the State, when requested to do so by a patient or his or her natural or lawful guardian or representative or a member of his or her family All state, county and municipal officers of this State shall recognize all licensed drugless practitioners in the practice of drugless methods the same as licensed physicians are recognized in the practice of medicine.

§ 2 This act shall take effect immediately

---

Senate Int No 522 (conc Assembly Int 620)  
—A bill introduced in the Senate by Senator James S Truman of Owego, N Y, concurrent Assembly Int 620, by Assemblyman Chas P Miller of Genesee County, would amend section 2828, Workmen's Compensation Law, by providing that bar of statute of limitations shall be deemed to have been waived unless objections to failure to file claim within one year is raised on first hearing at which all parties in interest are present

Referred to Labor and Industry Committees of both Houses

*Comment* This bill will be dropped unless request is received to carry it

---

Senate Int No 530 (conc Assembly Int 756)  
—A bill introduced by the Joint Committee on Pollution of Waters, would add new section 343-d, Public Health Law, providing for cleanliness in shellfish industry and for medical examination of workers

Referred to Public Health Committee

*Comment* None at present

## IN ASSEMBLY

Assembly Int No 120—A bill introduced in the Assembly by Assemblyman Joseph Reich of Kings County, would add new section 213, Labor Law, requiring employers to furnish nursing and first aid service in factories, mercantile and other establishments

Referred to Labor and Industry Committee

*Comment* No further comment at present

---

Assembly Int No 123—A bill introduced in the Assembly by Assemblyman Joseph Reich of Kings County, would add new subdivision 10-a,

section 360, Tax Law, by permitting deduction from income for tax purposes of all expenses paid during the year for medical, surgical or dental services

Referred to Taxation and Retrenchment Committee

*Comment* No comment is necessary on this bill, it is presumed that the medical profession would favor such an amendment

Assembly Int No 127—A bill introduced in the Assembly by Assemblyman Joseph Reich of Kings County, would amend sections 570, 571, Education Law, by providing that boards of edu-

cation and trustees shall appoint physicians and dentists and may employ nurses for service in schools

Referred to Public Education Committee

*Comment* Members of the Society can refer to page 85 of the February 1, 1924, issue of the Journal in regard to the comment then written relative to the similar bill introduced by Mr. Reich last year and again the year before in which the obnoxious part was opposed by the medical profession giving over to the authorities throughout the State the privilege through law of *providing* treatment for disease or physical defects of school children thus adding one more agency in the already complex provisions of the State for the care of its so-called wards

As last year, physicians can have no objection to the employment by the educational authorities of whomsoever they will for the inspection of school children and thus protect others from infectious or contagious diseases, or in case of ignorance of parents, aid the school in advising that physical defects be remedied

It, however, must always be recognized that the advice must be according to present day construction of thought, as the possibility is open of over-enthusiastic and semi-educated persons in authority suggesting that treatment of certain types be instituted which has long ago been proven to be of faddist nature and of no value whatsoever

This can readily be appreciated in the poor and unscientific suggestion that a child with Potts disease be recommended for manipulation of the spine which has long ago been proven to be the most injurious type of treatment for such a condition and is directly at variance with present day science

Assembly Int No 167—A bill introduced in the Assembly by Assemblyman Joseph Gavagan of New York County, would amend sections 40, 115, Workmen's Compensation Law, relative to compensation and time limit in case of occupational diseases

Referred to Labor and Industry Committee

*Comment* Unless comment or request is received from the members of the Society this bill will be dropped

Assembly Int No 182—A bill introduced in the Assembly by Assemblyman John Meegan of Erie County, would amend subdivision 6, section 15, Workmen's Compensation Law, by providing compensation for disability shall not exceed \$30 per week, instead of \$20 as at present

Referred to Labor and Industry Committee

*Comment* Unless comment or request is received from the members of the Society this bill will be dropped

Assembly Int No 184—A bill introduced in the Assembly by Assemblyman F. A. Miller of Kings County, would amend section 118, Workmen's Compensation Law, by authorizing physical examinations and practical tests of claimants to determine loss of use and proportionate loss of use of a member, result and test to be part of the record

Referred to Labor and Industry Committee

*Comment* None as yet

#### THE CHIROPRACTIC BILL.

Assembly Int No 185—A bill introduced in the Assembly by Assemblyman William Nicoll of Schenectady County, would define and regulate the practice of chiropractic

Referred to Public Health Committee.

Assembly Committee on Public Health, Room 310, The Capitol Messrs Lattin of Orleans, Bartholomew of Washington, Esmond of Saratoga, Austin of Monroe, Lyon of Cayuga, Loomis of Delaware, Van Cleef of Seneca, Thomas of Rensselaer, Bernhardt of Erie, Shepherd of Kings, Berg of Bronx, Kinsley of Bronx, Bungard of Kings

Assembly Int No 191—A bill introduced in the Assembly by Assemblyman Samuel Rosenman of New York County, would amend section 21, Workmen's Compensation Law, by providing in proceeding to enforce a claim it shall be presumed that an accidental injury, if proven, arose out of and in course of employment

Referred to Labor and Industry Committee

*Comment* Unless Comment or request is received from the members of the Society this bill will be dropped

Assembly Int No 201—A bill introduced in the Assembly by Assemblyman Frederick L. Hackenberg of New York County, would amend section 3, Workmen's Compensation Law, by providing for compensation for disabilities or death resulting from poisoning by benzene or by chlorine or iodine derivatives or petroleum products, etc

Referred to Labor and Industry Committee

*Comment* The attention of the members is called to this bill, inasmuch as it may affect employees of professional men, of hospitals, laboratories and the like where many of the substances mentioned in the bill are used in such institutions or in the offices of physicians

Assembly Int No 202—A bill introduced in the Assembly by Assemblyman William Hart of Richmond County, would amend section 3, Workmen's Compensation Law, by providing for compensation in case of poisoning by gasoline or other volatile petroleum products

Referred to Labor and Industry Committee

*Comment* Unless Comment or request is received from the members of the Society this bill will be dropped

Assembly Int No 203—A bill introduced in the Assembly by Assemblyman Joseph Reich of Kings County, would amend section 3, Workmen's Compensation Law, by providing for compensation in case of infection or inflammation of skin on contact surfaces, due to oils, cutting compound or lubricants or due to dust, liquids, fumes, gasses or vapors

Referred to Labor and Industry Committee

*Comment* Same comment is offered as that on Assembly Int 201, Unless request is received from the members of the Society the bill will be dropped

Assembly Int No 204—A bill introduced in the Assembly by Assemblyman Michael Reilly of Kings County, would amend section 3, Workmen's Compensation Law, by providing for compensation in case of diseases due to inhaling silica dust

Referred to Labor and Industry Committee

*Comment* None, the bill will be dropped

Assembly Int No 214—A bill introduced in the Assembly by Assemblyman Lewis G Stapley of Livingston County, would amend section 107, State Charities Law, by authorizing investigations by superintendent or officer designated by him, and authorizing an arrangement for use of laboratory service of hospital

Referred to Judiciary Committee

*Comment* None, the bill will be dropped

No 214

Int. 214

IN ASSEMBLY,

January 15, 1925

Introduced by Mr Stapley—read once and referred to the Committee on Judiciary

AN ACT

To amend the state charities law in relation to the duties of the superintendent

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section one hundred and seven of chapter fifty-seven of the laws of nineteen hundred and nine, entitled "An act relating to state charities, constituting chapter fifty-five of the consolidated laws," as last amended by chapter forty of the laws of nineteen hundred and four-

teen, is hereby amended by adding two new subdivisions, to be subdivisions twelve and thirteen, to read as follows

12 The superintendent, or other officer designated by him, shall, in any investigation into the treatment and care of patients and the conduct, performance or neglect of duty of officers or employees, be authorized to subpoena witnesses, compel their attendance, administer oaths to witnesses, examine witnesses under oath and require the production of any books or papers deemed relevant or material to the inquiry or investigation The attendance of the witness and the giving of testimony or production of a book or paper by him may be compelled under the provisions of sections four hundred and six, four hundred and seven, and four hundred and eight of the civil practice act

13 The superintendent may enter into an arrangement with proper municipal or county officials or others under which the laboratory service of the hospital may be made available to municipalities or counties or parts thereof adjacent to the hospital, when in his judgment such an arrangement will be in the interests of public health and not prejudicial to the interests of the institution or its work He may receive moneys to be applied to extension of laboratory service or in consideration thereof and expend the same in accordance with the terms of the arrangement entered into as aforesaid, subject to the rules of procedure to be established by the board of managers

§ 2 This act shall take effect immediately

#### THE NARCOTIC BILL.

Assembly Int No 215 (conc Senate Int 115)  
—See concurrent Senate Int No 115 for digest and comment

Assembly Int No 229—A bill introduced in the Assembly by Assemblyman A Spencer Feld of New York County, would add new section 579-b Education Law, providing for county supervisors to supervise education of children with retarded mental development

Referred to Public Education Committee

Int 229

IN ASSEMBLY,

January 19, 1925

Introduced by Mr Feld—read once and referred to the Committee on Education

AN ACT\*

\* Matter in *italics* is new matter in brackets [ ] is old law to be omitted

To amend the education law, in relation to the supervision of the education of children with retarded mental development.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Article twenty-b of chapter twenty-one of the laws of nineteen hundred and nine,

entitled "An act relating to education, constituting chapter sixteen of the consolidated laws, such chapter having been amended by chapter one hundred and forty of the laws of nineteen hundred and ten and such article added by chapter five hundred and fifty-three of the laws of nineteen hundred and seventeen, is hereby amended by adding a new section, to follow section five hundred and seventy-nine-a, to be section five hundred and seventy-nine-b, to read as follows

§ 579-b *County supervisors* In every county of the state there shall be a county supervisor to supervise the education of children with retarded mental development as defined by this article In counties within the city of New York there shall be such additional supervisors as may be necessary and shall be determined by the board of estimate and apportionment The salaries of such supervisors shall be a joint charge against the cities, union free school districts and school districts within the county, but the state shall apportion to such city or district, in the same manner as teachers' quotas are apportioned thereto, an amount equal to one-half of the salary paid to each such supervisor and charged against such city or district The amount of the salary to be paid to supervisors shall be determined by the legislative authority of the county No person shall be a supervisor unless he be a duly licensed physician with at least five years' experience in the treatment of mental disorders and diseases The children mentioned in this article shall be given special courses of mental training under the general direction and supervision of the supervisor Such children shall be required to attend such special courses until they are eighteen years of age

§ 2 This act shall take effect immediately

*Comment* Your Committee on Legislation believes that this bill as drawn appears to be an eminently sane bill and that it should receive the support of the Society

Assembly Int No 233—A bill introduced in the Assembly by Assemblyman Paul T Kameron of New York County, would amend section 28, Workmen's Compensation Law, by authorizing industrial board to permit claim for compensation to be filed within two years after accident or death

Referred to Labor and Industry Committee  
*Comment* None, the bill will be dropped

Assembly Int No 236 (conc Senate Int 228)  
—See concurrent Senate Int 228 for printed bill and comment

Assembly Int No 237 (conc Senate Int 231)  
—See concurrent Senate Int 231 for digest and comment

Assembly Int No 301—A bill introduced in the Assembly by Assemblyman Frank H Lattin of Orleans County, would amend section 13, Workmen's Compensation Law, by permitting injured employees at employer's expense, to engage medical or other attendance

Referred to Labor and Industry Committee.

*Comment* This bill is somewhat similar to Assembly Int 570, and is that which your Society in large measure has been asking in relation to the Workmen's Compensation Law County Chairmen are requested to forward their approval to the Labor and Industry Committee

Assembly Int No 302—See February 6th Journal for digest This bill will be dropped

#### THE STATE DEPARTMENT OF EDUCATION BILL AMENDING THE MEDICAL PRACTICE ACT

Assembly Int No 307 (conc Senate Int 211)  
—See concurrent Senate Int 211 for digest and comment

Assembly Int. 384—A bill introduced in the Assembly by Assemblyman Samuel Mandelbaum of New York County, would add new section 1097-a, Greater New York Charter, requiring board to furnish free eyeglasses to school children unable to pay therefor

Referred to Cities Committee

*Comment* This is a local bill and will be dropped

Assembly Int No 386 (conc Senate Int 308)  
—See concurrent Senate Int 308 for digest and comment

Assembly Int No 399 (conc Senate Int 283)  
—See concurrent Senate Int 283 for digest and comment

Assembly Int No 414 (conc Senate Int 278)  
—See concurrent Senate Int 278 for digest and comment

No 415

Int 414

IN ASSEMBLY,

January 26, 1925

Introduced by Mr Wallace—read once and referred to the Committee on Codes

AN ACT

To amend the code of criminal procedure in relation to jurisdiction of courts of special sessions

*The People of the State of New York represented in Senate and Assembly do enact as follows*

EXPLANATION—Matter in italics is new matter in brackets [ ] is old law to be omitted.

Section 1 Section fifty-six of the code of criminal procedure is hereby amended by adding

at the end a new subdivision, to be subdivision forty, to read as follows

40 For a wilful violation or refusal or omission to comply with any lawful order or regulation prescribed by any local board of health or local health officer where the penalty prescribed does not exceed fifty dollars nor the imprisonment six months

§ 2 This act shall take effect July first, nineteen hundred and twenty-five.

Assembly Int No 422—A bill introduced in the Assembly by Assemblyman Samuel Rosenman of New York County, would amend section 352, Civil Practice Act, by providing physicians and nurses may disclose professional information as witnesses in action to annul marriages on ground of fraud

Referred to Codes Committee

*Comment* This is an attempt to break down Section 352 of the Civil Practice Act relative to confidential communications between patient and physician, and inasmuch as there already exists on the statute books sufficient laws which if enforced and lived up to by the parties about to enter into marital relations, sufficiently cover the ground whereby the physicians need not be dragged in as a party to either of the complainant or the defendant

Assembly Committee on Codes, Room 344, The Capitol Messrs Esmond of Saratoga, Robinson of Tompkins, Hutt of Erie, Gedney of Rockland, Wallace of Nassau, Skinner of Schenectady, Sargent of Onondaga, Pammenter of Monroe, Galgano of New York, Schoffel of Bronx, Rosenman of New York

Assembly Int No 434—A bill introduced in the Assembly by Assemblyman Jerome C Ambro of Kings County, would amend section 355, Prison Law, by providing for removal to hospitals of prisoners confined either for civil or criminal cause, when they require immediate medical or surgical treatment

Referred to Penal Institutions Committee

No. 436.

Int 434

IN ASSEMBLY,

January 27, 1925

Introduced by Mr Ambro—read once and referred to the Committee on Penal Institutions

AN ACT

To amend the prison law in relation to removal of sick prisoners from jail

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section three hundred and fifty-five of chapter forty-seven of the laws of nineteen hundred and nine, entitled "An act relating to prisons, constituting chapter forty-three of the consolidated laws," is hereby amended to read as follows

§ 355 Removal of sick prisoners from jail If the physician to a jail, or, in case of a vacancy, a physician acting as such, and the warden, or jailer, certify in writing, that a prisoner confined in the jail, *either in a civil cause or upon a criminal charge*, is in such a state of bodily health that [his life will be endangered unless he is] *he requires immediate medical or surgical treatment and that in their opinion he should be removed to a hospital for treatment*, the county judge, or, in the city and county of New York, one of the justices of the supreme court, must, upon application, make an order, directing the removal of the prisoner to a hospital within the county designated by the judge, or, if there is none, to such nearest hospital as the judge directs, that the prisoner be kept in the custody of the chief officer of the hospital until he has sufficiently recovered from his illness, to be safely returned to the jail, that the chief officer of the hospital then notify the warden or jailer, and that the latter thereupon resume custody of the prisoner

§ 2 This act shall take effect immediately

*Comment* This is an eminently good bill for the care and protection of human life in relation to an individual when incarcerated, and your Committee on Legislation feels that it should be supported, and unless there be objections heard it will forward its approval to the introducer of the bill and to the committee in which it rests

The bill will be dropped pending any changes

# State Department of Health

## LOOK AT THE LABEL

The attention of the Department has recently been called to a case in which the attending physician administered 28,000 units of tetanus antitoxin, using six different bottles, under the impression that he was using diphtheria antitoxin. Fortunately, the patient did not have diphtheria, as first suspected.

If the initial diagnosis had been correct, a child's death might readily have occurred as a result of the neglect to administer diphtheria antitoxin due to failure to read the labels on the bottles.

## TETANUS—1923

During 1923 there was recorded for the State, exclusive of New York City, a total of 47 deaths attributed to tetanus. In four of these deaths the cause was undetermined, but for the remainder the causes noted were as follows:

Unknown	4
Pistol wound	1
Blank cartridge wounds	6
Gunpowder burn	1
Wound of hand caused by a fire-cracker	1
Dart thrown causing injury below left eye	1
Roller-skating, fell on sidewalk—abrasion on knee	1
Tetanus neonatorum	3
Abscessed teeth (five extracted)	1
Lacerated scalp	1
Fell on stub or piece of wood injuring hand	1
Fracture—hit with clam shell	1
Fractured arm—fall	1
Fractured arm—fall, swing	1
Abrasion	1
Crushed foot, tree fell on it	1
Crushed wound of toes	1
Wound hand—fell on fly wheel motorboat engine	1
Post-diphtheritic paralysis-uremia	1
Incised wound of toe—cut with axe	1
Septic parotitis	1
Punctured wound of foot—rusty nail	3
Fall from roof—fractured wrist	1
Fall—injuring skull	1
Fall from coal trestle—fractured wrist	1
Stone thrown by another—infected wound, forehead	1
Blister on heel from shoe	1
Sliver penetrating leg	1
Vaccination (cowpox)	1
Kicked by horse	1

Fall from horse	1
Hypodermic injection by unknown quack	1
Syphilitic ulcers—arms and hands	1
Following thyroidectomy—4 weeks previous	1
Electric burns	1

Of these deaths, 5 occurred under five years of age, 23 or practically 50 per cent, between the ages of five and nineteen, 15 between twenty and sixty, and 4 over sixty years. Their incidence was between the months of March and December inclusive, none occurring in January or February, and 38 between June 1 and October 3. The highest monthly total was reached in July, the month of the glorious Fourth, the next highest being in October, which claimed nine deaths. There were 39 deaths of males and 8 of females.

## PROMPT IMMUNIZATION PREVENTS OUTBREAKS

The health officer, who, by prompt action, prevents an epidemic from starting is to be commended far more than he who quells an outbreak, but the former gets far less publicity.

Two instances of prompt action which probably prevented serious outbreaks of diphtheria and typhoid fever in at least two families in the town of Skaneateles were recently found in a report made by the health officer of that municipality, Dr. Milton E. Gregg, to the Division of Communicable Diseases.

Called to attend members of an Italian family, he found diphtheria of the throat present in a boy, and a case of nasal diphtheria in another child who had recently been brought by his mother, the housekeeper, from the city of Fulton. Antitoxin was administered to the patients and the other members of the household, as well as to children of neighboring families.

A case of typhoid fever developed in another family, the patient being a young man who had recently returned from a visit to Cincinnati, Ohio. The health officer succeeded in having all the other members of this family vaccinated with State typhoid vaccine. Had this not been done others in the family probably would have contracted the disease, as the patient had a severe diarrhea, and the home conditions were such that it would have been very difficult to keep the disease from spreading.

As events turned out, no further cases of either disease developed.

# NEWS NOTES

## PRE-CLINICAL SIGNS OF DISEASES OF THE SKIN

By HOWARD FOX, M D,

NEW YORK CITY

Abstract of the Eighth Lecture in the Symposium on Periodic Health Examinations, given in the New York Academy of Medicine on January 15, 1925, under the auspices of the Medical Society of the County of New York, and illustrated with lantern slides

There are practically no pre-clinical signs in the vast majority of skin diseases. They appear as a rule without warning from either the clinical or laboratory standpoint.

Two symptoms might however be mentioned which occasionally precede the outbreak of cutaneous lesions, namely pain and itching. Strictly speaking even these are not pre-clinical. Herpes zoster in a certain proportion of cases may be preceded by neuralgic pain before the appearance of the characteristic vesicles or even the slightest amount of redness. Itching or a sensation of burning may accompany a number of inflammatory diseases, but is rarely present before the outbreak of the eruption. In the disease known as pruritus with lichenification (lichen simplex) the lesions may be preceded for a variable time by severe itching. Pruritus may of course be present without ever producing any visible evidences of scratching and constitute a disease—*sui generis*.

In presenting the dermatological aspect of periodic health examination I would like to touch upon three phases of the subject which seem to be pertinent.

- 1 The significance of the so-called precancerous dermatoses and of scars

- 2 Some of the serious diseases whose early recognition is all important

- 3 The relation of certain diseases of the skin to internal disorders, often of a more serious nature

A large number of cutaneous affections have been incriminated as a possible source of malignancy. In this category belong the pigmented nevi, concerning the importance of which opinions seem to differ. There can be no doubt that when a malignant process begins in a pigmented mole (generally a melano-carcinoma) it is most serious. When metastases have occurred, there is no disease which is more certainly fatal. Fortunately it is a very rare one. When the almost universal occurrence of small pigmented moles is considered, the chances of malignancy arising from such lesions is exceedingly small. The type of pigmented mole which is most dangerous is the flat, bluish black one. The vast majority

of pigmented nevi can be safely left alone. When in rare instances they show signs of activity, they should receive immediate attention and be vigorously destroyed (cautery, electro-coagulation, etc.) When pigmented moles are situated in locations such as the bearded region where they are liable to frequent traumatism, they should be destroyed.

Among other cutaneous lesions which may be the starting point of malignant disease should be mentioned xeroderma pigmentosum, chronic radiodermatitis, senile, seborrheic and arsenical keratoses, leucoplakia, ulcers, scars, fistulae, lupus vulgaris, inveterate psoriasis, Paget's disease of the nipple, and Bowen's precancerous dermatosis. While any one of the above affections may serve as the origin of cancer, this is certainly not the ordinary sequence in the vast majority of cases.

The disease which best merits the appellation of precancerous is probably xeroderma pigmentosum. This appears first in childhood, chiefly on the exposed parts of the body, and bears a close resemblance to the changes produced by excessive irradiation from the roentgen ray or radium. It appears to be a form of sensitization to actinic rays and is eventually fatal as a rule from the formation of prickle cell epithelioma. The termination of severe cases of chronic radiodermatitis is well known even by the laity. Leucoplakia is by no means an invariable forerunner of cancer especially where smoking and other forms of irritation are avoided and unskillful or half way methods of treatment are not employed. While cancer may develop upon a lupus vulgaris, for instance, this does not happen except on very rare occasions. The same may be said of the majority of the so-called precancerous affections.

Scars of various types will be noted in the course of periodic examinations, though their significance is not always understood. The so-called spontaneous keloid is often seen upon the chest and is a well known racial peculiarity of the negro. It differs from the hypertrophic scar, which does not extend beyond the confines of the original injury. The scars of burns and tuberculosis are keloidal, banded, and deforming, in con-

trast to those of syphilis which are soft, pliable and small in comparison with the amount of ulceration or infiltration which preceded them. The scars of nodular (late) syphilides with their grouping in circles or portions of circles are often as characteristic as the original lesions which caused them. Scars of herpes zoster, variola, acne varioliformis and self-inflicted wounds (malingerers) are generally characteristic.

There are certain serious affections of the skin whose early recognition is of the greatest importance. At this time a cure may be obtained, while if allowed to progress this may become impossible. Lupus vulgaris when appearing at the outset as a small group of apple jelly nodules upon the cheek, especially in young individuals, can be excised or vigorously treated by other means. When the disease has progressed, and especially when it has invaded the mucous membrane, a cure is often hopeless.

Leprosy is a disease which should be recognized early not only for the sake of others (in communities where the disease is endemic) but for the patient's sake. Even with the modern method of using ethyl esters of chaulmoogra oil, very few lepers, in my opinion, are ever cured. In the earliest stages however, such an event is possible. Any yellowish-brown macules which are more or less definitely anaesthetic, especially in persons from a leprosy region, should arouse the suspicion of this dreaded disease.

Cutaneous cancer occurs most frequently on the face where it is of the relatively benign type, which practically never metastasizes. On the extremities and genitals and about the orifices it

is often a much more serious problem. While cancer of the skin may assume many forms, the most characteristic symptom is the presence of a semi-translucent waxy border. Absence of pain and a tendency to bleed easily are also noted in this disease.

For the early recognition of syphilis, it is fortunate that in most cases (at least in males) there is a definite initial lesion. That this may be a very insignificant ulceration without the classic induration is unfortunately true. The expression "typical Hunterian chancre" is misleading in that it causes many to overlook small lesions of the genitals which should awaken at least a suspicion of syphilis. It seems necessary to frequently caution against the practice of cauterizing genital sores until at least repeated dark field examinations have been made.

Various eruptions of the skin are simply signs of internal disorders or constitute a single symptom of a general disease. Rosacea is almost invariably a sign of gastro-intestinal disturbance, and the same is true of acute urticaria. Lupus erythematosus is probably due to focal sepsis, in some cases of a tuberculous nature. Eczema, furunculosis, pigmentation, and xanthoma may all be caused by diabetes. In rare instances keratoses of the feet may be due to gonococcal infection. The rare condition known as acanthosis nigricans is an indication of internal malignancy. The dermatitis of pellagra is simply one of the symptoms of a serious disease.

While certain skin diseases are purely local conditions, others should be looked upon as danger signs suggesting a more serious underlying condition.

## TOMPKINS COUNTY MEDICAL SOCIETY

The January meeting of the Tompkins County Medical Society was held in the parlors of the Board of Commerce, Ithaca, N. Y., Tuesday evening, the 27th, 1925. President John W. Judd in the chair.

The minutes of the December meeting were read and approved.

1925—President Judd announced the following standing committees for Legislative: Luzerne Coville, M. A. Dumond, Minor McDaniels. Public Health: L. T. Genung, William A. Smith, J. H. VanMarter.

Since our last meeting the Society has met with a great loss in the death of our fellow member, Dr. Roscoe C. Wilson of Ithaca.

A fitting memorial was presented by the Committee on Resolutions and read while the members stood with bowed heads. The memorial was

directed spread upon the minutes and a copy sent to the bereaved family.

Dr. Luzerne Coville was by motion designated as the representative of the Society in the Board of Commerce of Ithaca with voting power.

It was moved and carried that the Annual Banquet be held in March.

Hon. Charles E. Treman of the Ithaca Trust Company then addressed the meeting upon "Investments." Among other things, Mr. Treman said: "This is the age of specialists, not alone in medicine but in many other fields. The person who has money to invest and has not made a study of investments, should get the advice of his banker, (specialist) and follow it. Remember there is no such thing as security, safety and 3½% a month. The safer the investment the lower the income. The person who develops the habit of systematic saving and investing in safe bonds

will be the most likely to have a steady income

Three things should always be looked after closely before investing First, safety of principal, Second, satisfactory income, Third, salability There is a vast difference between investing and speculating Make your investments first until you have secured a satisfactory income Then if you have any surplus funds that you can afford to lose, if things should go that way, you may be justified in speculating Remember that if you buy stocks, you become a partner in the business which is managed by others If you buy bonds, you have what amounts to a mortgage

Mr J F Hickey, merchant and business man, then addressed the meeting on "Business Methods for Doctors of Medicine" After complimenting the medical profession upon its high ideals as shown in its code of ethics, Mr Hickey expressed his belief that Medical Colleges should include in their curriculum a short business course He stated that from his observation there

were as many physicians who are successful in a business way as there are merchants The one outstanding point of failure with both is that of collection of accounts Almost every one dislikes to force collections It is necessary, however, that collections be made in order to protect one's home, family and business Mr Hickey made special mention of collection problems of the Hospital (of which he is a trustee), and suggested the members of the society might be able to help in their solution

Hon J T Newman then addressed us on "Wills and Estates," giving rather detailed instructions as to what should go in a will to properly safeguard the interests of the estate and the beneficiaries

After each address the subject was opened for discussion and many questions were asked and much information gained

The meeting was then adjourned, a light lunch was served, and a social hour enjoyed

## CHILD WELFARE CLINICS IN YATES COUNTY

Early in January I received a request from Dr Florence McKay, Director of the Division of Maternity, Infancy and Child Hygiene, asking me to present the matter of Children's Health Consultations to the various County Medical Societies in my district and secure from societies a list of designated members to conduct these consultations every six months, and offering a modest honorarium (about \$15.00 a day) for part payment, the community to add to it as it sees fit

The society seemed to be interested in the proposition and on motion, the following Children's Health Consultation Committee was appointed to act with the President Dr G Howard Leader, Dr John A Hatch, Dr Charles E Doubleday

The following physicians were designated to conduct consultations in the various districts

Village or Town	Examiners	Location of Clinic
Dundee Village and Barrington Township	Dr McDowell	Dundee
Benton Township	Dr Maloney	
	Dr Welker	Belona
Italy Township	Dr Ward	
	Dr Chaffee	Italy Hollow
	Dr Foster	
Jerusalem Township	Dr Costello	Branchport
	Dr Halstead	

Township of Potter	Dr Halstead	Potter
	Dr Chaffee	
Rushville Village	Dr Halstead	Rushville
	Dr Chaffee	
Milo Township	Dr Hatch	Second Milo
	Dr Foster	
Starkey Township	Dr Maloney	Lakemont
	Dr Wright	
Torrey Township	Dr Welker	Dresden
	Dr Ward	

This list is only tentative, as some of the physicians designated were not at the meeting and may decline to serve In that event, the Children's Health Consultation Committee will select others to act as consultants

It is planned to devote two weeks in May and two weeks in October for holding these consultations Miss Nellie Z Mahar, the County Nurse, will make all preliminary arrangements for these clinics Additional nursing service will be furnished by the State Department of Health Miss Mahar will do the follow-up work

At the annual meeting of the Society, the Children's Health Consultation Committee will make a report of the work done throughout the County, and make such recommendations as it sees fit for the future conduct of these consultations

B WAKEMAN, M D,  
District State Health Officer

trast to those of syphilis which are soft, pliable and small in comparison with the amount of ulceration or infiltration which preceded them. The dermatitis of pellagra is simply one of the symptoms of a serious disease.

While certain skin diseases are purely local conditions, others should be looked upon as danger signs suggesting a more serious underlying condition.

## TOMPKINS COUNTY MEDICAL SOCIETY.

The January meeting of the Tompkins County Medical Society was held in the parlors of the Board of Commerce, Ithaca, N. Y., Tuesday evening, the 27th, 1925. President John W. Judd in the chair.

The minutes of the December meeting were read and approved.

1925—President Judd announced the following standing committees for Legislative: Luzerne Coville, M. A. Dumond, Minor McDaniels. Public Health: L. T. Genung, William A. Smith, J. H. VanMarter.

Since our last meeting the Society has met with a great loss in the death of our fellow member, Dr. Roscoe C. Wilson of Ithaca.

A fitting memorial was presented by the Committee on Resolutions and read while the members stood with bowed heads. The memorial was

directed spread upon the minutes and a copy sent to the bereaved family.

Dr. Luzerne Coville was by motion designated as the representative of the Society in the Board of Commerce of Ithaca with voting power.

It was moved and carried that the Annual Banquet be held in March.

Hon. Charles E. Treman of the Ithaca Trust Company then addressed the meeting upon "Investments." Among other things, Mr. Treman said: "This is the age of specialists, not alone in medicine but in many other fields. The person who has money to invest and has not made a study of investments, should get the advice of his banker, (specialist) and follow it. Remember there is no such thing as security, safety and 3% a month. The safer the investment the lower the income. The person who develops the habit of systematic saving and investing in safe bonds

who recently died at the age of 91, after a long lifetime spent in the general practice of medicine. The account says

"They were called family doctors. And when one was sick or 'run down' or discouraged about things, there was a mighty lot of comfort in calling on the old doctor, in having him come to the house, and just sit around and ask about the folks, and, if there were children in the family, he gave their ears a tweak, asked them how's school, and did they like coasting, and how were all the dolls, and what did Santa Claus bring them for Christmas. Small talk. No talk for a specialist."

As a matter of fact, the best consulting specialists show exactly these traits which are supposed to be the distinguishing marks of the old family doctor, and they are far more kind and considerate than the gruff old family physician usually was.

The editor then goes on to describe the journey of the old doctor through the snow and darkness and continues

"And he would wipe some of the melted snow from his beard (that was before doctors knew that beards carried germs) and ask

"Well, how's the little boy today?" and laugh

"Then he would sit down beside the bed and feel our pulse. How nice and cool his fingers felt. 'Let me see your tongue.' Then he would use the spoon handle to depress the back of the tongue, and he would peer into the throat. 'Say "ah".' And we'd say 'ah' and look at the big eyes of the doctor, and we liked what we saw there.

"Then the doctor would open his worn black case and leave a few pills and put something in a tumbler of water and then he would go away. And we would just feel as safe as if we had a guaranty that everything would be all right."

But the trouble was that everything was not always all right. The virulent attack of diphtheria with no membrane in sight, the stomach ache and vomiting which meant intestinal obstruction and immediate operation—in such cases as these the old doctor was not a life saver.

And then too modern physicians have to undergo as many hardships as their predecessors. The principal difference is that while formerly some member of the stricken family first braved the storms and cold and darkness to call the doctor, and thus guaranteed the real need of the doctor's services, now the call goes over the telephone and the doctor makes the journey alone while the stricken family stay at home and build a roaring fire to thaw out the frozen doctor when he arrives.

The *Troy Times*, January 27, contains the following headlines

"Indication of presence of typhoid germs in the City of Troy's water supply

"Startling announcement made of Board of Contract meeting. Chlorinating machine purchased and will be operated this week."

The account then describes the purchase of two chlorinating machines at a cost of \$2,300 as an emergency measure, and the commendation of the water commissioner "for his prompt work in the situation." The account then goes on to say

"It was then brought out that Troy is one of only a few cities in the state which does not either filter or chlorinate the water.

"Isn't it a fact that Troy's water supply has been regarded as among the best in the state?" inquired the Mayor.

"The source has," replied the City Engineer, "but any big watershed is liable at any time to contamination."

"The engineer further advanced the information that unless the city authorities acted promptly in the matter, the Interstate Commerce Commission would take action at the instigation of the railroads, who take their water from this city to be used for the tanks on the train. In fact, it was brought out that the Boston and Maine Railroad had already ordered that no more water be taken from Troy."

The main point of interest to medical men is that Troy has taken effective steps to safeguard its water supply.

The *Schenectady Union*, January 27, carries an appeal to the people to avail themselves of periodic health examinations. It quotes Health Officer Collins as saying

"There occurred in Schenectady during the past two years 119 sudden deaths, I mean by that, persons who died suddenly while at their work, on the street, or found dead in bed, etc., without medical attendance. It is safe to say that if a large majority of these cases had a periodic health examination made, these sudden deaths might have been prevented or at least life prolonged.

"Such examinations can be had and be well done in the office of your family physician. There is no reason why any conscientious physician cannot make a thorough physical examination and render effective advice to his patient. A good time for these examinations would be on the birthday of the individual, and if this rule was once established and regularly carried out, I am sure in many instances life might be prolonged."

Such news items as these will do much to popularize the demand for the examinations.

# THE DAILY PRESS

We have received word of several meetings of Medical Societies by means of clippings from the daily press

The *Liberty Register*, January 15, contains an account of a meeting of the Sullivan County Medical Society held on January 14 in Liberty. The President of the Society, Dr Charles S Rayevsky, stated that the Society was planning to take an active part in the solution of health problems of Sullivan County in the future.

Dr F W Sears of Syracuse described the periodic examinations as they were being planned in Syracuse, and the plan will be sponsored by the Sullivan County Medical Society.

In our medical survey of Sullivan County printed in the *Journal* last December, we called attention to the opportunities which the medical men of Sullivan County had to assist in solving the peculiar problems of that county. We are gratified to read that the physicians are taking active steps to solve their own problems.

The *Poughkeepsie Star* of January 15, contains a very brief account of the annual meeting of the Dutchess-Putnam Medical Society which was attended by fifty members.

The *Salamanca Inquirer*, January 9, contains a short account of the annual meeting of the Cattaraugus County Medical Society on January 6, in Salamanca, but this account, like the preceding one, gave only the bare facts of the meeting. The daily newspapers are always glad to comment on the activities of the medical societies, if the civic work of the society is told to the reporters.

The daily newspapers do not often carry accounts of the meetings of medical societies, and the only reason is probably that the physicians do not give the news to the papers. We wish that the Secretary of every County Medical Society would send an account of every meeting to the local newspapers of the County, and to the editors of the dailies which circulate in the county.

The *Kingston Leader*, January 14, contains the following encouraging news regarding the activities of the physicians of a sister city:

"The Medical Society of the city of Amsterdam is setting an example for other medical organizations by taking an active interest in

the work of the local health department. Dr Schiller, health officer, with the approval of the mayor, has indicated his intention to appoint an advisory council made up of members of the society, suggesting that it meet monthly for conferences with him regarding his work. The suggestion that a monthly meeting of the society be devoted to discussion of civic affairs is being considered."

The daily papers throughout the land have carried stories of an epidemic of diphtheria in Nome, and of the heroic journey of six hundred miles by relays of drivers of dog sleds, in order to bring antitoxin to the stricken people. The *New York Sun*, February 4, says:

"The story of the daring of Leonard Sepalla, who ran the serum on the first long lap of the relay and crossed Norton Sound in an unbroken swirl of wind driven snow and ice, was told for the first time today.

"The ice in the sound was heaving—breaking up and drifting out to sea—before he started the race. Ignoring this warning, which meant that his life was in peril from forces over which his strength and endurance could have no control, the musher set out.

"His race behind his twenty dogs was made by this danger one where the need of speed was trebly great. He must race to reach the next musher in the relay for the relief of Nome, he must race against the blizzard which threatened himself and his dogs with death from exposure, he must race against the danger that the ice would break up beneath him, bringing his own death and the destruction of the precious serum.

"He might have avoided the last danger by taking a longer route around the bay. That would have lost time, when time at Nome meant life. He took the chance on the ice. He won through, saved many hours and perhaps many lives.

"Sepalla is expected in Nome today. His daughter, Sigried, is one of those ill with the disease."

All the front page news stories of the epidemic, published daily for over a week, extolled the virtues of diphtheria antitoxin, and commended the sled drivers and their dogs by whose united heroism the life-saving serums was carried to the people of Nome.

The *Hudson Star*, January 10, contained a tribute to the late Dr John J Glover of Hudson.

## MEDICINE AND PSYCHOLOGY\*

By HERMAN G MATZINGER, M.D.,

BUFFALO, N Y

FOR a long time the feeling has been growing among thinking and observing people that there is something wrong with higher education. It has not alone become a chief topic among educators but has spread to the intelligent public. Magazine articles and books are appearing in bewildering numbers offering studies, critiques and suggestions. All manner of new experiments are being tried in the hope of finding some solution or, at least, some suggestion of a workable remedy. There have developed two groups of investigators, one concerning itself with the curriculum and methods of teaching, the other with the mental equipment and make-up of the student. The latter has been very busy during the recent past, and is deeply engrossed in developing tests which shall determine who is fit for higher education as it is offered now, while the former is still busy and has been for a long time with determining what subjects are essential and how they shall be grouped and taught. Today we find that this investigation is no longer confined to colleges and universities, but has spread to and involved professional and public schools as well. If we inquire for the cause for this widespread unrest, we soon discover that the principal reason is to be found in the fact that education, as it is today administered, does not prepare the student for life, as it professes to do, in spite of enormous expenditure of time, money and effort. In other words the practical results are disappointing not alone to the educator and the educated, but also to the intelligent public who pays the bills and who offers its sons and daughters in the hope of making them more useful and more successful in the pursuit of happiness than they otherwise might be. You will agree that true happiness results only from useful, creative work—accomplishment in any line so long as it is not

destructive to or does not interfere with the natural rights of others. An opportunity to work is the secret of happiness. Without it we must needs be unhappy no matter what our station in life or how much education we may have. It is at least a debatable question whether higher education fulfills its mission in this respect. There can be no question as to the value of higher education in the perpetuation of knowledge and in the advancement of both knowledge and science, but it is far from being an established fact that it, in any material way, enhances the average individual's prospects for usefulness and therefore for happiness. There are many unsuccessful people who believe that lack of education is the chief cause of their failure and many who believe that they are successful in spite of it, just as there are many who will readily admit that much of the time spent in getting as much education as possible not only delayed them in getting to work, but tended to scatter effort and interest.

Almost everyone who has been for a long time interested and occupied in the teaching of medicine is more than certain that there is also much that is wrong in the courses as they are offered today. In spite of most marvelous advance in the so-called medical sciences, it is generally acknowledged that the proportion of really good physicians graduated is, at best, no larger than in earlier days. We recognize, of course, that in some measure this is due to the fact that many undertake the study of medicine who are unfitted for the practice of the healing art, but this was as true in past years as it is now, the principal difference which is noteworthy being that in the development of the technical and scientific departments of medicine there are now openings for many trained specialists, whose work though valuable and necessary, can not be called practicing medicine. The phenomenal development of this side of medicine has, of course,

## BOOKS RECEIVED

Acknowledgment of all books received will be made in this column and this will be deemed by us a full equivalent to those sending them. A selection from these columns will be made for review, as dictated by their merits, or in the interest of our readers.

**INFECTION, IMMUNITY AND INFLAMMATION** A Study of the Phenomena of Hypersensitiveness and Tolerance, and Their Relationship to the Clinical Study, Prophylaxis, and Treatment of Disease By FRASER B GURD, B.A., M.D., C.M., F.A.C.S., Montreal The C V Mosby Company, St. Louis 1924 Price \$5 00

**AN AFRICAN HOLIDAY** By RICHARD L. SUTTON, M.D., LL.D., Fellow of the Royal Geographical Society of Great Britain With 102 Original Illustrations The C V Mosby Company, St. Louis, 1924 Price \$2.25

**OPERATIVE SURGERY** By J. SHELTON HORSLEY, M.D., F.A.C.S. Attending Surgeon, St. Elizabeth's Hospital, Richmond, Va. With 666 Original Illustrations Second Edition The C V Mosby Company, St. Louis, 1924 Price \$12 50

**THE DIAGNOSIS OF CHILDREN'S DISEASES, WITH SPECIAL ATTENTION TO THE DISEASES OF INFANCY** By Professor Dr. E. FEER, Director of the University Children's Clinic, Zurich, Switzerland Translated by CARL AHRENDT SCHERER, M.D., F.A.C.P. J. B. Lippincott Company, Philadelphia Price \$5 00

**FRACTURES AND DISLOCATIONS, IMMEDIATE MANAGEMENT, AFTER-CARE, AND CONVALESCENT TREATMENT WITH SPECIAL REFERENCE TO THE CONSERVATION AND RESTORATION OF FUNCTION** By PHILIP D. WILSON, A.B., M.D., F.A.C.S., and WILLIAM A. COCHRANE, M.B., Ch.B., F.R.C.S. Edin. 978 Illustrations J. B. Lippincott Company, Philadelphia. Price \$10 00

**THE CRIPPLED HAND AND ARM** By CARL BECK, M.D. 302 Illustrations J. B. Lippincott Company, Philadelphia. Price \$7 00

**METHODS AND PROBLEMS OF MEDICAL EDUCATION** (Second Series), Division of Medical Education, The Rockefeller Foundation, New York, 1924

**MANUAL FOR DIABETICS** By GLADYS L. BOYD, M.D., and MARION D. STALSMITH Introduction by F. G. BANTING, M.D. 12 mo. Cloth, 101 pages Price \$1.50 net Funk & Wagnalls Company, Publishers

**THE EFFECTS OF INANITION AND MALNUTRITION UPON GROWTH AND STRUCTURE** By C. M. JACKSON, M.S., M.D., LL.D., Professor and Director of the Department of Anatomy, University of Minnesota. 117 Illustrations P. Blakiston's Son & Co., Philadelphia. Price \$8 00

## BOOK REVIEWS

**ANGINA PECTORIS** By SIR JAMES MACKENZIE, M.D., LL.D. Large Octavo of 253 pages, illustrated London, Henry Frowde & Holder & Stoughton, New York, Oxford University Press, 1923 Cloth, \$9 00 (Oxford Medical Publication)

In this work Mackenzie gives his theory and complex of symptoms, and his ideas as to the cause of heart pain, in detail. The origin is from the changes in the heart muscle. The nature of reflexes, and the relation of the sympathetic nerves of the heart to cerebro-spinal sensory nerves, is described in full, so as to associate definite ideas concerning the distribution of pain sensations, in Angina Pectoris. All of the essential matter and notes are enumerated from Mackenzie's own personal records and observations. Methods are given for further heart investigation, so that a better prognosis can be known, better treatment instituted and heart failure prevented. In the last quarter of the book are 160 Case histories, taken from the author's work which give actual notes concerning the progress and study of heart pain subjects.

A T M

**CHRONIC INTESTINAL STASIS (ARBUTHNOT LANE'S DISEASE)** A Radiological Study By ALFRED C. JORDAN, M.D. Large octavo of 230 pages with 314 illustrations New York, Oxford University Press 1923 Cloth \$7 50 (Oxford Medical Publications)

This monograph of over 200 pages deserves a better title than it has received. The beautiful radiographic reproductions which it contains cover the X-ray diagnosis of nearly all the gastrointestinal diseases which are recognizable by this method of diagnosis. The

author voices Lane's opinion that practically all human ills, from cancer of the rectum to pyorrhea, are due to intestinal stasis, and the latter can be cured by a Curtis belt and suitable dietetic and hygienic measures or by colectomy. It seems too bad that a radiographer of Jordan's ability should waste such beautiful X-ray material to illustrate a subject which today has no legitimate standing in medicine. If the text be entirely disregarded, a study of the illustrations would be well worth while.

A

**FEDERAL INCOME TAXES, PRINCIPLES AND PRACTICE**, by E. E. ROSSMOORE, B.S., Certified Public Accountant (New York) D. Appleton and Co., New York and London, 1924

No taxpayer is in greater need of clear and authoritative information than the physician and such a work as the one here considered provides just such material.

Just as many medical textbooks are divided into Principles and Practice so this treatise is similarly divided.

Those medical students and practitioners who like the case report method of teaching medicine will feel right at home in the presentation of 467 actual problems with their complete solutions. The need for such treatises is in that "while good citizenship requires that a man render unto Cæsar the things which are Cæsar's, it is essential that he keep intelligently and adequately informed so that he may determine his own liability, protect his own rights and be prepared to render competent judgment when the questions of taxation come up for national discussion."

WM. HENRY DONNELLY

the knowledge of structure there soon came the various sciences which deal with organic functions and which collectively are known as physiology. From these come special sciences dealing with abnormal function with the attendant tissue alterations called pathology, bacteriology, immunology and pharmacology. All these have today reached a truly astonishing degree of perfection that commands admiration, and yet there is something vital lacking, namely, the understanding of the behavior of the body as a whole, as an organism.

The practice of medicine depends on a thorough and intimate knowledge of life processes as a whole as well as of separate organs because they are inter-related and inter-active and together determine what we call human behavior. So it seems plain that psychology is rightly a part of physiology and should constitute a further development of that science with a view of explaining conduct in general and bridging the chasm between medicine and psychiatry.

Psychology is therefore a logical extension of the science of physiology and should be taught as such in a thoroughgoing course in medicine. The study of human behavior is the study of the human mind and one needs but be reminded of the prevalence of mental disorders and diseases to realize the importance of this extension of the science of physiology in its bearing on treatment as well as prophylaxis. How can we longer afford to neglect to incorporate so important a matter in the teaching of medicine? Even the layman is aware of its importance and is eager to discover the elements of behavior and to see a formulation of laws to describe and explain the complex phenomena of life which constitute mind. Many of them are much more able and better trained in measuring human action and experience than the average physician.

Very few physicians who are thoroughly conversant with and daily make complicated biological and chemical tests can apply the simplest mental tests. Indeed few of them know their significance. Some of them have had a premedical acquaintance with conventional psychology as a department of philosophy but do not realize that psychology is rapidly divorcing itself from this field of speculative inquiry and has entered the domain of the natural sciences.

A large amount of material obtained by careful observation of the various phenomena of mental life and experience has been recorded and scientifically studied and analyzed. Out of this has come first genetic psychology which concerns itself with the historic development of behavior and behaviorism which

attempts to formulate laws of conduct. It has been suggested that together these two lines of investigation be called psychobiology, and that since they concern themselves with instinctive and voluntary habit reactions they belong to physiology and should be taught as such in the curriculum of every good school of medicine. The neglect of such instruction and the passive attitude exhibited by those who standardize medical training has opened the way for the development of the many spurious sects and cults who, with half truths and fragmentary knowledge, draw attention to their advanced position and insight and undertake the treatment and correction of many disorders which are manifestly entirely medical. One can hardly over-estimate the number of mild psychoses and borderline conditions that sorely need medical study and management to say nothing of the psychoses proper and the psychoneuroses. You know only too well how indifferent physicians are about them, and when the matter of defect comes up with delinquency and conduct disorders which are anti-social or even criminal there are few who can apply or suggest anything better than the most archaic medical or legal treatment. Mental disorders and conduct disorders in general are so numerous that their cost to the taxpayers is enormous. The second largest single item of expense our state has is the care of the insane, and if you add to this the amount of police, court and prison cost connected with juvenile delinquency and criminality, it would dumfound you. Materially increasing this is the cost of the backward and retarded if not defective school child who clogs the educational machine and who through ill advised and poor treatment also becomes an unnecessary burden and an extra cost to the community.

A normal body will function normally and show normal behavior or mind in any normal situation in life. Any departure from such conduct or evidence of mind is due to temporary or permanent disorder of function of the body as a whole. This again may be the remote effect of some originally more circumscribed disorder or defect. The reason for the lack of intelligent and scientific medical treatment of these conditions lies in the obvious fact that no course in physiology includes more than the careful study of separate organ and tissue functions, and ignores entirely the conduct of the body as a whole, as an organism. Moreover, neither genetic psychology or behaviorism are included in the preparation for courses in neuropsychiatry or psychiatry.

It must be admitted that this new science of behavioristic psychology is hardly well enough developed at the present time to become a

tended to magnify its importance in such a way that medical education and the practice of medicine have become so scientific and so specialized that interest in the individual patient is almost become negligible. Together these developments have determined unfortunate situations affecting the schools, the graduates and the public. Schools of medicine have been classified and standardized on a basis of numbers of square feet of floor space devoted to laboratory work and the amount of original research work done in a given space of time. Naturally the student becomes more and more impressed with the importance of the laboratory in not only making diagnoses, but in the scientific treatment of disease. It is small wonder then that he refuses to practice in smaller towns and rural communities, and remains where laboratories are handy and his diagnosis can be confirmed or made for him before he undertakes treatment.

Discoveries in science in any department quickly become public property and the people demand that they receive the benefit of them especially when health and life are at stake. In the interest of the thus neglected extra-urban sick the state offers to supply these facilities for the physician who will practice among them and the way is opened for state medicine and state control of physicians. Magnification of the scientific side of medicine does another thing which is deplorable in that it determines specialism in practice, because the conscientious student will soon decide that he can not master all of so complex and scientific a subject and will therefore elect to devote himself to a smaller field in which he may become as proficient as he chooses and not only take a higher position among his colleagues, but be free from the danger of malpractice suits.

The very worst consequence of this materialistic trend in medical education is a direct result of centering interest on localized organic tissue change as a necessary cause of disease manifestations and serious modification of function of organs. It is this which has made the autopsy and the specimen so much more important and interesting than a recovery, and it is this which has made us lose sight of the all important fact that the human being is an organism and must be studied and treated as such. Failure here is the secret of the appeal which the cults make to so many otherwise intelligent people who are unwilling to believe that they are mere machines with interchangeable parts.

The earliest protest to this conception of life was made a long time ago when man assumed that he was created in the image of God. However egotistic this conception may be, it

nevertheless gave proof of the fact that man early observed that he was "fearfully and wonderfully made," that he is not a mere automaton and that he has unique faculties and possibilities which are not entirely subject to the laws of matter. There has come a recrudescence of this feeling in our day which is alienating the faith of thinking people in medicine as it is practiced today. All the great and wonderful achievements of preventive medicine and other notable scientific discoveries in the nature of disease processes are accepted and properly evaluated, but in spite of all this there is a manifest tendency toward a feeling that something is lacking. The intimate individual human needs in illness and other troubles are not met satisfactorily and as a natural result we observe with much concern a leaning towards the cults who have something to offer other than scientific clinical study, strict regimen and medicine. We need not try to persuade ourselves that they have much to offer, least of all should we ignore them in the hope that their influence will soon pass and do no harm. Investigation will show that they are supplying a demand which they carefully but empirically meet and develop while we ignore it because it does not interest us. What are we going to do about it?

The most powerful determiners of human activity are the instincts and the emotions—hereditary and unlearned reactions—which no laboratory can as yet measure, whose influence, for example, on metabolism through the endocrine system is only beginning to be appreciated and whose relation to human conduct in health and in disease offers an interesting and profitable field of investigation. The practitioner in medicine whose chief object is to maintain and restore health should be well grounded in the principles of human action and experience. This he can obtain through psychology, which is the science of behavior and experience. It is safe to say that the average physician is as ignorant of the body activities through which human experience gains expression, in other words, of mind, as were the physicians of a thousand or more years ago, of the structure and functions of the organs of the body and life processes in general.

The history of the development of medicine shows that there was a constant desire to understand human behavior. In the quest for a scientific basis for the practice of the art of medicine it first became necessary to know the structure of the body and gross anatomy was developed. This was followed by histology, cytology, embryology and, finally, by pathological anatomy. With the growth of

tions, local infection and internal secretions, could never have discovered"

Psycho-therapy is a re-education and much of the difficulty or ease of treatment depends largely on the individuality of the patient, especially his intelligence more than upon anything else. For this reason we should always consider the individual and his environment to that extreme degree recognized by the competent internist.

The treatment should in the first place be directed toward the nature of the disorder, and, secondly, on the personal equation, the individuality of the patient. As in all other therapeutic measures, we should consider the patient as an individual and his environment. This includes a careful history and most thorough physical and neurological examination. During the history taking, the all-important relation between physician and patient is established and care should be had at all times to establish that confidence which is necessary. If this confidence is built up from the beginning of the re-educational process, by the physician demonstrating his honesty of purpose and truthfulness, much will be gained. The patient should be told the truth always, and at the onset, should be advised that the symptoms present are those of a disease complex, an exaggeration and not imaginary or unnecessary and selfish indulgences. The truth is otherwise and the patient should be made to feel at the earliest possible moment that his difficulty is not imaginary.

Treatment is re-educational, a readjustment, mental, physical and moral as to the needs of life and an insight through which there may not be a recurrence.

Where possible, the environment should be changed and the patient's life should be systemized and made as regular as possible, giving as many new "contacts" as can be used. These latter can be increased as time goes on. Readjustment to full usefulness must be made the primary goal, not mere immediate comfort. Whether the headache of resentful disappointment, or the indigestion of anger, or the palpitation of fear, the situation should be treated by always leading the patient to a consideration of the condition at fault as more important than the symptoms. In this way,

symptoms may be made the most helpful object lessons, illustrating and clinching the more theoretical re-education.

He should be given that definite knowledge of his condition which we call "insight," and through which he may avoid a recurrence and when necessary, be removed temporarily from his ordinary home environment to one which is as free as possible from distractions, but at the same time gives opportunities for normal and not invalid life. His life should be as regular as possible, so that he gets not only the advantage of good habits, but gets some helpful discipline in doing things, because they are to be done, and not because he does or does not feel like doing them. A regime is of the greatest help in divorcing action from feeling, and work, play and rest should be properly divided and arranged. Rest induced if necessary, is a factor always to be carefully considered, as is work and play, and each properly measured for the individual. Diet is important, for we find many of these patients who are under or over-fed. Hydrotherapy is helpful, as are carefully graduated exercises.

That confidence gained at the first interview is all important and any antagonism generated should first be broken down, and his confidence, hope and determination to get well encouraged at all times. His readjustment to his environment by advice and encouragement, and a knowledge of his own so-called normal limitations. At all times no bizarre or ultra-scientific explanations should be given, but plain, lucid instructions, remembering at all times our object—to give useful applicable knowledge to the patient from which he shall derive full power of normal adaptation. We should at all times remember the role played by the simple organic functions and any disturbance adjusted by medical means if necessary. Remembering the part played by the endocrine system, whether cause or effect, our attention should be directed toward the correction of any possible imbalance. In short, our object is a physical as well as mental readjustment. In this connection may I stress the necessity and importance of mental hygiene, and ask your support of the work being carried on by the National and State Committees on Mental Hygiene.

distinct subject in the curriculum of a medical course, but it must also be granted that it has very important medical relations which make it imperative to acquaint the student with them. In the school which I serve we are now giving in the second year a 30-hour didactic course in what for lack of a better name we call medical psychology and which is intended to prepare the student for the fourth year course in psychiatry. But the subject has a much broader application and deserves elaboration. The present needs could be well met by including psychology in the premedical

course and extending it later in the course on physiology as psychobiology, which in turn could be correlated with neurology, psychopathology and psychiatry. In this way the graduate in medicine would not only be prepared to care properly for the mass of patients who now are allowed to flounder about among the cults, but also to be of material help in the social disorders of the community which he serves. Finally, it would hasten the day when there will be developed a science of mental hygiene which will become the last word in preventive medicine.

## PSYCHO THERAPY \*

By G. KIRBY COLLIER, M.D., F.A.C.S.

ROCHESTER, N. Y.

**S**INCE the dawn of medicine, psycho-therapy has been used by the medical practitioner, but only of late years has this been placed upon any semblance of a scientific basis. Although using psycho-therapeutic methods unconsciously, many have scoffed at its usage, and it has, in a measure, fallen into the hands of the charlatan and quack who has used it unintelligently, many times with very favorable results and more often with severe harm to the patient. As a result of this, much of the literature upon this subject has fallen into lay hands, and in those unprepared for such, has given rise to many faulty conceptions of abnormal psychology.

Much of the popular literature has dwelt upon the sex feature, limiting this aspect to that narrow sphere, understood by the layman, and not to the broad sex idea which is inclusive of most or all of that which goes into the formation of life. Unfortunately this sex idea is also prevalent among many physicians and due to their repugnance of this feature, they have held aloof and criticized any of the various methods of approach.

That we might have a proper conception of our patient and to be able to treat him intelligently, it is necessary that we have some understanding of normal psychology and its pathology. We must be able to recognize the fact that there is a pathology, psychic as well as somatic, and that we are liable to psychic injuries, to the same degree as physical, when our defenses are lowered. We must recognize that many of our concepts are faulty and that many of these are never righted, that our so-called self-analytic mechanism is not always

100 per cent perfect and that it is not always retroactive. We must recognize that all adults meet the psychological crisis in life, the larger number reacting normally, a few breaking down mentally. All at some time suffer grief, emotional stress, illness, infection and varying mental conflicts, and a few react with symptoms of a psychosis of varying degrees. Many have alcoholic infection, but only a few develop paresis. Alcohol was formerly a common beverage, used excessively by many but only a few reacted by showing mental symptoms commonly associated with alcohol, and so it is with all the many incidents and accidents of life that befall the individual. From the modern psychiatric standpoint, as well as that of the internist, each patient becomes a distinctly individual unit, differing from all others in hereditary characteristics, physical and psychological development, environmental influences and mental trends with a personality that reacts independently to disease, mental conflicts and all the assorted experiences of life in its various stages. As has been so aptly expressed by Dr. Adolf Meyer, in advising of the approach to the study of a mental case: "After studying in each patient all the non-mental disorders, such as infections, intoxications, and the like, we can now attack the problems of life which can be understood only in terms of plain and intelligible human relations and activities, and thus we have learned to meet on concrete ground the real essence of mind and soul, the plain and intelligible human activities and relations to self and others. There are in the life records of our patients certain ever-returning evidences and situations which a psychiatry of exclusive brain speculation, auto-intoxica-

\* Read at the Annual Meeting of the Medical Society of the State of New York at Rochester, N. Y., April 23, 1924.

tions, local infection and internal secretions, could never have discovered"

Psycho-therapy is a re-education and much of the difficulty or ease of treatment depends largely on the individuality of the patient, especially his intelligence more than upon anything else. For this reason we should always consider the individual and his environment to that extreme degree recognized by the competent internist.

The treatment should in the first place be directed toward the nature of the disorder, and, secondly, on the personal equation, the individuality of the patient. As in all other therapeutic measures, we should consider the patient as an individual and his environment. This includes a careful history and most thorough physical and neurological examination. During the history taking, the all-important relation between physician and patient is established and care should be had at all times to establish that confidence which is necessary. If this confidence is built up from the beginning of the re-educational process, by the physician demonstrating his honesty of purpose and truthfulness, much will be gained. The patient should be told the truth always, and at the onset, should be advised that the symptoms present are those of a disease complex, an exaggeration and not imaginary or unnecessary and selfish indulgences. The truth is otherwise and the patient should be made to feel at the earliest possible moment that his difficulty is not imaginary.

Treatment is re-educational, a readjustment, mental, physical and moral as to the needs of life and an insight through which there may not be a recurrence.

Where possible, the environment should be changed and the patient's life should be systemized and made as regular as possible, giving as many new "contacts" as can be used. These latter can be increased as time goes on. Readjustment to full usefulness must be made the primary goal, not mere immediate comfort. Whether the headache of resentful disappointment, or the indigestion of anger, or the palpitation of fear, the situation should be treated by always leading the patient to a consideration of the condition at fault as more important than the symptoms. In this way,

symptoms may be made the most helpful object lessons, illustrating and clinching the more theoretical re-education.

He should be given that definite knowledge of his condition which we call "insight," and through which he may avoid a recurrence and when necessary, be removed temporarily from his ordinary home environment to one which is as free as possible from distractions, but at the same time gives opportunities for normal and not invalid life. His life should be as regular as possible, so that he gets not only the advantage of good habits, but gets some helpful discipline in doing things, because they are to be done, and not because he does or does not feel like doing them. A regime is of the greatest help in divorcing action from feeling, and work, play and rest should be properly divided and arranged. Rest induced if necessary, is a factor always to be carefully considered, as is work and play, and each properly measured for the individual. Diet is important, for we find many of these patients who are under or over-fed. Hydrotherapy is helpful, as are carefully graduated exercises.

That confidence gained at the first interview is all important and any antagonism generated should first be broken down, and his confidence, hope and determination to get well encouraged at all times. His readjustment to his environment by advice and encouragement, and a knowledge of his own so-called normal limitations. At all times no bizarre or ultra-scientific explanations should be given, but plain, lucid instructions, remembering at all times our object—to give useful applicable knowledge to the patient from which he shall derive full power of normal adaptation. We should at all times remember the role played by the simple organic functions and any disturbance adjusted by medical means if necessary. Remembering the part played by the endocrine system, whether cause or effect, our attention should be directed toward the correction of any possible imbalance. In short, our object is a physical as well as mental readjustment. In this connection may I stress the necessity and importance of mental hygiene, and ask your support of the work being carried on by the National and State Committees on Mental Hygiene.

## EDUCATING AND PLACING OUT MENTAL DEFECTIVES\*

By O H COBB, M D,

SYRACUSE, N Y

**S**EVENTY-THREE years have passed since New York State, inspired by the success of Eduard Seguin, in France, undertook the education of mental defectives. Seguin, in 1837, at his private school in Paris, and later as Director of the School of Idiots, at the Bicetre, developed his Physiological Method of Education. He demonstrated that sluggish intellectual functions could be aroused by energetic oft-repeated stimuli to the brain through all sensory pathways and by calisthenics to correct deformities and improve the health, posture and movements. Maintaining that the idiot could learn by doing he gave special attention to developing the functions of the hand. He emphasized the importance of attractive, cheerful surroundings, intelligent, kindly teachers and attendants, formation of habits of right living and industry, imitation of teacher and playmates, creation of new interests and desires, and the use of the awakened faculties to express and satisfy them. Seguin's methods with little modification are still used in the institutions for training the lower grades, and form the foundation of all our work with mental defectives.

Our ideas regarding the problem have undergone evolution with the passing years. In the beginning it was considered only as a matter of education. It was hoped that most of the children, even of the lowest grade, taken at an early age, could be so improved as to be self-supporting in a favorable environment. Later came the recognition of insuperable natural limitations of many and the need of custodial care for their protection from a misunderstanding and often hostile world. The early years of this century brought a realization of the gravity of mental deficiency as a social problem. In 1909 the French psychologists, Binet and Simon, published their tests for intelligence, which were soon adapted to the American child and popularized by Goddard. The widespread application of these tests to inmates of reformatories and penal institutions led to the overemphasis of the peril of mental deficiency to the community and the demand for the permanent segregation of all mental defectives. Of late years the policy has been to accumulate information by establishing contact with all defectives at an early age through mental clinics, aided by the schools and other social agencies, provide special classes where possible,

and parole or colonize the most promising cases from the institution.

State mental clinics under the supervision of the State Commission for Mental Defectives and the State Hospital Commission are now available in nearly all the larger centers throughout the State. By medical treatment, advice to parents, improvement of environment, or placement in special or manual training classes, combined with follow up work by the referring agency, many problem children are adequately cared for. Where environment cannot be adjusted, no special classes are available or delinquent tendencies are developing, the child is committed to an institution. Idiots and many imbeciles require permanent custodial care.

State schools for mental defectives are located at Syracuse, Newark, Rome, Thiells (near Haverstraw), and Napanoch. Syracuse accepts only morons of school age, Newark, women of child-bearing age, Napanoch, male delinquents over sixteen, Letchworth Village and Rome, all types. A department of the Bedford Reformatory for Women is devoted to female delinquents over sixteen. New York City maintains at Randalls Island an institution for 2,000. It is estimated that 10,000 beds are needed in the State Schools, or 4,000 more than present capacity.

Admission to an institution is upon commitment by the county superintendent of the poor (in some cities by the commissioner of charities) or by a court of record, or children's court, after certification by two qualified physicians (or a physician and psychologist). It is desirable that all cases should be considered and recommended by a mental clinic.

The institution school, adequately equipped, provides light, airy rooms for grade, manual and industrial training, an amusement hall with moving picture and stage equipment, and a gymnasium. The staff of trained teachers should be sufficient for classes not exceeding twenty-five. Not alone the school proper, but the entire institution is planned for the development of good habits and industry, for the training of mental defectives proceeds from reveille to taps. Kitchens, dining-rooms, laundry, store-rooms, sewing-rooms, shops, garden, bakery and colonies all contribute to the cause. An atmosphere of cheerful activity pervades all departments.

On admission the routine includes a thorough physical examination, with treatment where indicated, psychometric tests and

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester N Y April 22, 1924

psychiatric admission note. Later the head teacher examines for school achievements, tests for possibilities in reading, writing, spelling and numbers, and places the child in his class. The history contains all available information regarding the child, including results of staff meeting and periodic routine examinations with special emphasis on personality traits.

Our objective is to train the idiot for self-help, the imbecile for simple tasks under supervision, and the moron for self-support in the community in a favorable environment.

The state syllabus is followed from kindergarten to fifth grade. The younger or duller pupils receive sensory and motor training, according to Seguin's methods. Kindergarten work is modified to suit the special needs and prepare a foundation for manual training. Special attention is given to time telling, the calendar, money and model store, self-expression is encouraged by retelling and dramatization of stories, group plays and more elaborate productions from time to time. Nature Study in all the grades is pursued with interest. The child usually grades according to mental age, though often retarded by mental sluggishness or laziness.

Music stimulates memory and improves speech. All sing in classes, choirs or glee club, a few learn piano and assist in kindergarten, physical training classes and Sunday school. A band and orchestra, playing difficult music at sight, call forth consistent hard work.

In physical training the aim is to improve health, posture and gait by marching, exercises, apparatus work and dances supplemented by indoor and outdoor games, hikes and a summer camp. Drill makes a boy orderly and alert. Boxing, which all boys love, improves moral conditions.

Manual training, which occupies half the school day, offers individual instruction and a wide range of choice in work, pattern and color scheme. It is one of the most effective means of developing a child's brain, stirs ambition and improves many conduct problems. Even destructive low grade children instead of tearing their clothes learn to tear up mattress ticks for carpet rags and unravel burlap bags for weaving. In the girls' manual classes an unlimited variety of hand work is available, and the boys repair shoes and furniture, and make tables, desks, toys, mattresses, brushes, brooms, toweling and mats. The older girls take a more serious part in the work of the institution. The boys are assigned as apprentices to the mechanics or baker, or learn farming at one of the colonies.

The first essential in our work is a cheerful, receptive attitude on the part of the children.

To this end attention is given to amusement. There are weekly dances and movies, monthly plays by the children in costume, and a spring festival with folk and æsthetic dances. The holidays are suitably observed, and Christmas and Fourth of July celebrated with pomp and circumstance. Hundreds of children attend the circus and county and state fairs. So far as possible discipline is maintained by rewards rather than punishments. For a month's good conduct and work a child receives a star button that means a special treat, such as a trip to the down-town movies or a picnic. A boys' court with full array of legal talent and the appearance of authority, but closely supervised, deals with the cut-ups. An offender may be sentenced to menial tasks for a week, but suspended and commuted sentences are the rule. Good conduct leads to appointment as an officer in the boys' battalion with membership in the officers' club, a separate table and other privileges. Regular religious instruction is given.

For successful work mental defectives must be treated as individuals not as a class. They have in common limited intelligence, but differ markedly in personality. A child may be obstinate, stubborn, resentful of correction, uncleanly, not able to concentrate on anything, lazy, emotionally unstable, given to sex tendencies or irregularities, generally opposed to institution rules and customs, or subject to periodic episodes. Temperament may be influenced by epileptic or schizophrenic tendencies. These qualities singly or in combinations interfere with progress and parole. Criminal or sex experience before admission is a detriment. The good qualities of these children, too numerous to mention, endear them to their teachers.

In considering a child for parole intellectual capacity is of less importance than personality. In general, under present industrial conditions, a moron without marked personality defect is considered capable of self support in a favorable environment.

There are two methods of social rehabilitation: colonization and parole. Colonies afford an intermediate step between closely supervised institution life and the comparative freedom of parole. In colonies, girls either work by the day in homes or with their supervisor in a near-by mill. Boys are employed on neighboring farms or elsewhere, while preparing for parole. In girls' colonies and in boys', where outside work rather than training is emphasized, a definite weekly amount is given for spending money and bank account, the balance of earnings going into the colony maintenance fund.

Parole is either to a home found by the

social worker or where conditions are favorable to the child's own family. In inferior families there is a tendency to conduct misdeeds and marriage of girls. Our experience has been that few boys marry. The social worker places girls at \$2 to \$10 per week in homes where they receive careful supervision and ample opportunities for safe recreation. Most boys are located on farms at wages varying with the season and their ability. Monthly conduct and financial reports are required, occasional visits made, and a monthly paper or mimeographed letter sent to all. Visits to the school and special entertainments serve to maintain cordial relations. All paroles are required to open savings bank accounts and may withdraw for any legitimate

purpose, not otherwise. Many have a balance of several hundred dollars. The term of parole is indefinite, that is, until a child is permanently provided for.

Colonization is largely a New York State development. Direct parole is in use in institutions throughout the country. Under favorable conditions colonization and parole may safely provide for at least a quarter of the institution population. The arguments in favor of parole and colonization are that they provide accommodation for hundreds who otherwise would receive no care, lessen the heavy burden upon the State for construction and maintenance, and afford social rehabilitation to many under the most favorable conditions.

## RELIEF MEASURES DURING LABOR.\*

By H W SCHOENECK, M D,

SYRACUSE, N Y

**T**HERE is no more commendable effort put forth by the obstetrician to-day than that which aims to ease the suffering of child-birth—unless it is the conservation of human life.

To accomplish these results to a far greater extent than ever before, realized, is no small task. But to incorporate in this endeavor, a desire to secure to these lives saved a bodily fitness ample to function to its best advantage, places upon the obstetrician a responsibility which is ponderous indeed.

Progressive obstetrics cannot countenance ease of delivery, however humane it may be, if it places either human life or bodily fitness in jeopardy.

The public, it is true, is clamoring for anything which makes for a painless birth. It stipulates, however, that the procedure must be without danger to mother and babe.

The press and popular magazines, within the past few years, have given much space to so-called painless child-birth.

Their exposition is made colorful and attractive, the disadvantages and dangers made to appear infinitesimal and not worthy of consideration. During the same period of time, medical literature has been copiously supplied with contributions on the subject of making labor easy and less painful. To the medical man, painless child-birth through the birth canal is something to be hoped for, but as yet unattainable.

The painless child-birth of the lay press has had its day, it has taken its toll—and the public,

pretty generally, is satisfied that it entertained a fancy, not a reality.

Will the claims made by the advocates of prophylactic version—prophylactic forceps—modified twilight sleep, as to safety and nearness of approach to a painless birth, stand the test of time and unbiased examination?

It is not fair to the men who employ these various methods to accuse them of bad faith, even though some of these measures in part or as a whole, throw into the discard some of our most cherished and long established rules of procedure for the care of the woman in labor—they may be in the right—if so, the failure to reduce the maternal and infant mortality and morbidity must be laid at the door of conservatism—if wrong, the burden of labors end results is upon them.

The results obtained by many operators, from experience with all three methods, should help to clear away the uncertainty which overshadows the question of their safety and effectiveness.

It would seem that the merits of any one of these over the other, when compared with spontaneous labor, should be reflected by a comparative analysis of their maternal morbidity, fetal and maternal mortality—incidence of lacerations and anatomical end results.

Such an analysis is made and presented for your consideration.

The records of 435 consecutive births in the hospital are used for this purpose. They were private patients, the majority had been seen early in pregnancy and had received prenatal super-

\* Read at the Annual Meeting of the Medical Society of the State of New York at Rochester N Y April 23, 1924

vision, the others were patients referred because of some unusual condition complicating pregnancy or labor

#### MORBIDITY

36 versions were performed, 30 in multipara, 6 in primipara

The technic of Potter with which you are familiar, was followed

The result sought in 16 multipara was solely to avoid the second stage of labor

There was no disproportion in any of these cases—heads were well engaged and delivery would have eventually terminated spontaneously

These 16 cases included

3 flat pelvises with moderate degree of contraction

The second baby in five twin births

5 R O P—3 L O A

Of the remaining versions in multipara, 14 in number, the indications were as follows

1—To correct a presentation impossible of delivery

1 chin posterior—1 shoulder presentation

2—To avoid dissipation of the vital strength of mother or child

2 cases of heart disease—1 thyroid—2 eclamptics—1 pre-eclamptic—1 accidental hemorrhage—1 placenta previa—1 cord presentation

There were also

3 cases in which head failed to engage because of a pendulous abdomen

Version in primipara numbered 6

1 transverse—2 marginal placenta previas—1 eclamptic—1 second baby in a twin pregnancy—1 occiput posterior which rotated into the hollow of the sacrum

Bag insertion preceded version in the first four cases

Most men will concede the justification for version in labors complicated by an abruptio placenta—placenta previa—presentation of cord or its prolapsus—pendulous abdomen not due to an insuperable disproportion

For in these cases version offers the safest method of delivery as well as the least painful

The justification for version in the cases complicated by diseases of heart—thyroid—pre-eclamptic or eclamptic toxemia and the 16 cases mentioned before is subject, it would seem, to the determination of its relative safety compared with other methods of procedure

It will be noted that version was not done in primipara as often as in multipara. In explanation of this it is necessary to remark that my experience with breech extraction in primipara has impressed me with the difficulty frequently met with in resuscitating babes born in this way. This was attributed to the prolonged interference

with the fetal circulation, resulting from an endeavor to accomplish a slow expulsion through a pelvis, the soft parts of which were not easily relaxed

The futility of overcoming this bad feature by rapid extraction manifested itself early, for this alternative is prone to result in the development of extended arms—nuchal hitch and deep laceration of the perineum, complications which increase rather than decrease risks

Preliminary ironing out of the perineum, a procedure which is supposed to eradicate the danger of an inelastic pelvic floor, did not seem to wholly overcome it

This reluctance to do version in primipara was furthered, in that the dangers to the babe were out of proportion to the relief obtained by the mother—as version is only a second stage procedure and little relief is afforded her in the first stage

I was not adversely influenced by the fear of tears, for I believed in a properly performed version these would be no greater than in a spontaneous delivery

It was in multipara that I believed version afforded a safe labor as well as the easiest labor possible

For in multipara we find the soft tissues offering little resistance and if the necessity arises, a rapid extraction can be done

Then too, the relief obtained by the mother in version in some multipara is far superior to that offered by the general anesthetic. Scopolamine and morphine administration is contra-indicated in the great majority of multipara because of the rapidity of labor

The fear of infection I never could quite be rid of, despite favorable statistics, so that a meticulous technic was scrupulously adhered to

Despite these precautions, the morbidity rate for multiparous version was 18 per cent—a rise in temperature of 100 or more on 2 days between the 2—14 was considered morbid

Two well-defined cases of puerperal endometritis developed—convalescence was very much retarded. The reason for temperature in the other cases could not be determined

The morbidity of the six primiparous versions was 80 per cent—this tremendously high figure is explained by the use of bags and other manipulations antecedent to version in these complicated cases

The 18 per cent morbidity is relatively high when compared with the rate for spontaneous deliveries in primipara which was 5 per cent and in multipara 37 per cent. This latter figure included a phlebitis in a bag case, and 2 cases in which a rise of temperature of 100 occurred for 3 days without clinical evidence of infection. These 2 cases had been packed for post-partum hemorrhage

Excluding these three complicated cases, the

morbidity of spontaneous delivery is slightly over 1 per cent

Low forceps or prophylactic forceps deliveries gave in multipara 4.8 per cent—in primipara 9 per cent

In breech deliveries in multipara the morbidity was nil

The morbidity of prophylactic version in multipara was exceeded only by the rate for breech deliveries in primipara which was 25 per cent and high forceps in primipara of 33.1-3 per cent

The reason for the high rate in forceps other than low in primipara is similar to that expressed in explanation of the 80 per cent morbidity in version in primipara (i.e., factors other than the procedure itself entered into the production of fever)

There were 8 dry labors—cervix was manually dilated five times—bags were inserted in two eclampsics and three pre-eclampsics

The rate of 25 per cent for breech deliveries in primipara finds its expression perhaps in the frequency with which both feet were brought down and extraction begun as soon as the cervix was completely dilated—a procedure necessitating invasion of the uterine cavity

The question of whether low forceps in themselves are a frequent source of morbidity is answered by these figures

In 64 low forceps (27 primipara—37 multipara) without cervical or perineal tears only two showed a morbidity—approximately 3 per cent

It is remarkable here, that of the four well-defined cases of puerperal infection in the whole series, two occurred in uncomplicated version—one in a bag insertion and one in a cesarean section

The explanation for the high morbidity of prophylactic version, inasmuch as no tears of cervix or perineum occurred, undoubtedly lies in the transference of pathogenic organisms from the vulva and vagina into the uterus

The raw surface created here by the separation of the membranes preparatory to the rupture of the amniotic sac affords a nidus for the growth and noxious activities of germ life

#### LACERATIONS

The frequency with which lacerations occurred in these various procedures observed, was as follows

In multipara cervical lacerations were equally rare in version—low forceps and normal deliveries

Secondary repairs held well, as did primary trachelorrhaphies. Only once did a tear occur in the latter type of operation. The laceration in a subsequent delivery instead of tearing along the line of suture showed a central tear in the posterior lip

Perineal lacerations were more frequent.

Breech deliveries gave no tears—version 3.1 per cent—spontaneous deliveries 9 per cent—forceps 20 per cent

Secondary perineorrhaphies, primary repairs of second degree lacerations and deep episiotomies invariably tore along the line of scar

Efforts used to prevent cervical and perineal tears in primipara and multipara were as follows

Pituitrin was not used unless complete dilation of cervix had occurred and then very seldom. Efforts to test dilatability of external os by separating fingers was avoided in primipara as well as in multipara, as this is a pernicious habit and results in a slight tear which extends usually, as labor progresses

In spontaneous deliveries the anesthetic was pushed to the surgical degree only when the brow could be reached through the perineum and recession of the head prevented—further extension of head was under control from then on—patient being deeply under and unable to call in to play forceful contractions of abdominal muscles. In version and forceps deliveries ironing out of perineum was practiced

The superiority of prophylactic version and breech extraction in preserving the tissues of the pelvic floor as shown by these figures, is dependent upon the gradual dilation of soft parts, by an unhurried expulsion of the fetal body with its smallest diameter first, reaching the largest by graduation

Version and breech extraction should, in primipara, for reasons above given, show a smaller percentage of lacerations than normal or forceps delivery

The records do not show this to have occurred

Version had 100 per cent of perineal tears—cervical tears occurred in 80 per cent

These are, however, not suitable cases for purposes of comparison as they were, in many instances, complicated by bag insertion

The Breech deliveries have not this drawback however, and since extraction here in most cases is similar to what occurs in extraction after version, these may stand for version and may be used for comparison with normal and forceps deliveries

In 62 spontaneous deliveries in primipara 48 per cent perineal tears and 44 per cent cervical tears were found

In 127 low forceps perineal tears were 64 per cent—cervical 42 per cent

In breech extraction 64 per cent perineal tears—cervix lacerated in 90 per cent

The striking part here is that spontaneous labor with respect to tears has the advantage over the other two procedures with version and extraction placed third

Inasmuch as tears of the soft parts are prone to increase morbidity, the full importance of the above comparison is obvious

The effect of lacerations on morbidity is shown by the following figures

In spontaneous labors in multipara with 9% tears, the morbidity was 17—In primipara the percentage of morbidity jumps to 5%, as the percentage of tears reach 48.5% in perineum—45% cervical

This would seem to indicate that tears, even though taken care of immediately after labor showing no breakdown subsequently in themselves increases morbidity

This question naturally arises, is not morbidity more frequent in cervical repairs than where cervix is left unrepaired? The figures obtained show unrepaired cervixes to give 12%—repaired 17%

#### THE ANATOMIC END RESULTS

The anatomic end results of all primipara numbering 230 cases delivered spontaneously, by forceps, or version was much better than expected

Forceps and version in twins accounted for a bilateral laceration of cervix, retroversion and moderate degree of prolapse

In three high forceps—one resulted in a relaxed vagina and cystocele, the second a cervical tear, prolapse, retroversion—the third, prolapsus and retroversion

Two normal cases of spontaneous labor without tears presented in one—vaginal relaxation and prolapse—in the other, prolapse, bilateral cervical tear

Twenty-eight lacerated cervixes were found—three trachelorrhaphies failed to heal out of 57

Twenty-five lacerations were left unrepaired purposely to determine whether or not they would heal spontaneously, and this was found not to occur

The final results as to integrity of birth canal depends, it would seem, not on whether spontaneous delivery occurred or whether forceps were applied or version done, but upon these factors

1 The avoidance of pituitrin or operative measures to deliver child with cervix not fully dilated This not only tears cervix but stretches and lacerates the connective tissue supports of uterus and bladder

2 Failure to employ episiotomy in those cases where undue stretching of soft parts or tears of same is imminent

3 Failure to pull down cervix into view in all cases and to repair if lacerated

4 The failure to appreciate the frequency with which lacerations are overlooked if examination is superficial For cervix tear without much blood loss and many pelvic floors are badly torn without tearing of the skin

#### FETAL MORTALITY

Twenty fetal deaths occurred in the 435 cases—a mortality of 4.5 per cent of this number

Seven were intra-uterine deaths—two from neglected prolapse cord—one a complete separation of a normally situated placenta at eight months—one fibroid completely obstructing the birth canal (seen for the first time after two days in labor—one true knot in the cord—one death, cause unknown—one death at five months, spontaneous delivery at the sixth month

There were five non-viable fetuses

One Placenta membranacea—one pre-eclamptic—one ablatio placenta—one toxic goitre—one marginal placenta

Pregnancy was interrupted in these five cases in the interest of the mother

Nine viable fetuses included

One fetus born of an eclamptic mother—died seven hours after a spontaneous birth

One medium forceps—mother had convulsions during extraction.

One spontaneous birth—mother died of influenza-pneumonia

Three still-born deaths followed high forceps

One still-born breech extraction in contracted pelvis

One hemorrhage of new-born—three days post-partum

One prophylactic version in multipara

If the seven intra-uterine deaths and five deaths in non-viable fetuses may be subtracted, the mortality would be 1.8 per cent

It is worthy of note that there were no deaths in uncomplicated spontaneous or low forceps deliveries

One death occurred in a prophylactic version in a multipara

The 100 per cent perfect results in spontaneous deliveries is attributed to the application of low forceps, and the use of episiotomy in many instances to hurry delivery when head was on the perineum and progress was at a stand-still

Then, too such procedures as induction of labor—cesarian section and version, saved many babes who would have been lost if birth had been left to natural forces

The death from prophylactic version could have been avoided by prophylactic forceps or spontaneous delivery

The same may be said for two deaths which occurred in a series of 24 versions not included in this report

All were ideal cases for version—a multiparous birth canal—head engageable—therefore no disproportion—yet complications resulted and three lives were lost

The first death occurred under these circumstances, a large baby—when version was completed, the cord prolapsed—no pulsation—no effort on part of patient to deliver baby was successful—traction was made—some difficulty with after-coming head—still-birth

Second case showed cord tightly stripped between thighs, the approximation of gluteal folds interfered with its detection in utero—the cord was cut when at vulva, babe inspired several times, patient was exhorted to bear down but the depth of anesthesia was such that no assistance from was forth-coming. Traction was made with pressure on fundus, a nuchal hitch and extraction of the other arm resulted

The time necessary to overcome this complication was evidently sufficient to cause death of babe

In the third case, a large baby—no progress from half-hearted efforts of the mother—traction equally inefficient—pressure made on fundus at time umbilicus was in sight—extraction of arms and fetal head resulted, efforts to correct complications exceeded time limit—fracture of clavicle and still-birth resulted

#### MATERNAL MORTALITY

The maternal mortality was 68 per cent

One patient died during the puerperium of broncho-pneumonia following a cesarian section. One of influenza-pneumonia at the time of delivery. One following cesarian section for liver type of toxemia

#### SUMMARY

It is evident in summarizing these findings, that

Normal labor unattended by unmistakable signs of maternal exhaustion or interference with fetal circulation, if allowed to progress to completion of second stage, is the least hazardous of the measures under consideration

The Maternal morbidity is less than prophylactic forceps or version. Lacerations of birth canal are lessened in incidence and degree. The maternal and fetal mortality is nil

It must be emphasized that this favorable outcome in spontaneous labors is only possible when the failures incident to a delivery left to nature are understood and overcome by preventive measures

To mention only a few of these preventive measures

- 1 Rigid asepsis both ante and post-partum
- 2 Regulation of expulsive efforts in precipitate labors to guard against deep laceration of birth canal
- 3 Protection of perineum and vaginal outlet by deep anesthesia and ritgens maneuver when head is emerging

4 An occasional episiotomy to guard against undue injury and permanent loss of integrity of pelvic supporting tissues

5 Repair of all lacerations, cervical and perineal, immediately after labor

Nature must be assisted here in these cases most favorable for her as well as under circumstances when her powers are unquestionably impotent

The procedure standing second to spontaneous labor is prophylactic forceps or low forceps

It takes this position because of its absence of fetal mortality and its low maternal morbidity

The procedure which gave the highest fetal mortality and maternal morbidity was prophylactic version

#### DISCUSSION

Does this depreciation of routine prophylactic version and forceps necessarily consign the woman in normal labor to an ordeal of suffering and a subsequent abnormal convalescence—I do not believe it does

For the administration of anesthetics, at the time of uterine contractions, early in the second stage of labor, gives much relief

The anesthetic of choice is gas oxygen

Its administration is more agreeable to the patient as is also its after effects

Nausea and vomiting is extremely rare

It is superior to chloroform, ether or anesthol, in that analgesia is obtained with greater rapidity and without interference with the force of uterine contractions

Therefore a greater degree of relief is obtained with less risk of prolonging labor or interfering with nature's method of avoiding post-partum hemorrhage

Combined with ethylene or ether when head is emerging, it curbs undue expulsive force

The one striking disadvantage in this method is the necessity for having, for hours at a time, an anesthetist of experience in attendance

This is prohibitive for financial reasons to the great mass of the public

Self-administration, a make-shift tried early in practice, was not without its failures and complications and the same may be said of the practice of allowing the inexperienced interne or doctor to give this type of anesthesia

Given, however, by an expert, the results are ideal in that while labor is not shortened nor made as free from pain as in the other two procedures, the relief is enough to make labor more comfortable and convalescence more rapid than where the anesthetic is only used at a time when the caput is in sight

In some multipara even before complete dilation of cervix has taken place, if membranes are ruptured, labor is completed with such rapidity under anesthesia that in order to avoid delivering

in bed, this procedure is done only in the labor room

Surely there is no call for prophylactic version or forceps here

We hear much of the suffering attendant upon posterior positions. In multipara, in the great majority of instances, rotation is not retarded.

Occasionally delivery is prolonged by slow rotation or the occiput rotates into the hollow of the sacrum.

In the former case analgesia during contractions and a bit of patience is necessary, in the latter event version or manual correction and forceps is indicated.

Interference in all cases in multipara either to prevent abnormal rotation or prolongation of labor with consequent suffering is unwarranted as well as dangerous.

Thirty-four per cent of the cases in this report were occiput posterior positions—94 per cent of them rotated spontaneously—six needed manual correction and forceps.

Why subject 100 individuals to operative measures for the sake of avoiding abnormal rotation which is likely to occur but six times out of a hundred.

The relief of the primipara is not so easy of attainment with anesthetics, as with version or scopolamine and morphine administration followed by forceps.

Scopolamine and morphine administration in the first stage of labor with morphine  $\frac{1}{4}$  gr and scop 1-150 as an initial dose in primipara, is far superior to all other procedures in the relief it gives, not only during this stage, but in the second stage also. As the head is emerging it must be supplemented by other anesthetics.

The advantages of scopolamine and morphine used as a first stage procedure other than its safety and marked relief is the gentleness and rapidity with which the cervical tissues are thinned out and complete dilation effected.

It curbs also the forceful expulsive efforts of patient where head is on the perineum making unnecessary the early perineotomy practised as a preventive measure against stretching—distraction and laceration of pelvic soft parts.

Its disadvantages are these:

1. Asphyxia or obligopnea in the new-born occurs in about 15 per cent of cases—it is not troublesome however, and babes respond readily to oxygen and intermittent compression of the chest wall.

2. The attendance of the obstetrician is necessary from the start of the administration to the birth of the child—if the maximum effectiveness of its use is desired.

3. Repeated dosage cannot be given according to rule. This will depend upon rapidity of progress of first stage and the response of patient to drugs.

Very occasionally errors in judgment as to how

long an interval will elapse from the first dosage to delivery occur. This should be at least four hours. Two things will happen, labor is stopped or unduly prolonged or babe is born before the drugs have been eliminated.

In neither instance is any particular harm done—the first is disturbing to one's equanimity—the second sometimes gives an asphyxiated baby which always responds well to treatment and suffers no ill effects afterwards.

One must, in order to avoid these errors, be willing to spend the time necessary to determine by frequent rectal examination, progression in thinning out of cervical tissues—in dilation of external os and in depth of descent and from this determine when morphine and scopolamine should be started and when scopolamine should be repeated if at all.

A fourth disadvantage is prolongation of second stage of labor. This does not occur as a rule if one starts dosage only when labor is well under way and discontinues scopolamine when cervical dilation is completed.

#### CONCLUSIONS

In concluding this paper, I am not unmindful or unappreciative of the personal benefits received from the work of Potter and De Lee. Version and breech extraction, from the teaching of the former, has been simplified and made less productive of untoward results than formerly.

The early perineotomy of De Lee with the application of low forceps in individuals under modified twilight sleep administration undoubtedly saves many fetal lives and avoids maternal birth canal injuries.

But at the same time one cannot, in the light of this analysis of results obtained, subscribe to the routine use of either the one or the other.

Nor can one honestly state that the hazards of these procedures should be treated lightly, for in so doing, men less experienced in matters obstetrical, would feel warranted in employing these measures indiscriminately, to the end that in version a tremendous fetal mortality and maternal morbidity would follow—in forceps and perineotomy, many pelvic floors would be destroyed.

This is certain—for the general practitioner their routine use would spell disaster.

For my own guidance, I am convinced that for these procedures to be effective in reducing the deaths and injuries incident to child-birth there must be:

- First. Discrimination in their application so as to meet the needs of the individual case.

- Second. The procedure must be performed under a rigid aseptic technic in hospital surroundings where conveniences and facilities are such that any emergency which may arise can be met, with promptness and precision.

# NERVOUS AND MENTAL STATES, FOLLOWING INJURIES TO THE HEAD\*

By DAVID EDWARD HOAG, M.D.,

NEW YORK CITY

THE physician is frequently meeting with cases showing what we are pleased to term a psycho-neurotic syndrome. In the experience of the writer, practically all head injury cases have following in their wake either nervous or mental symptoms, in varying degrees of intensity. It generally becomes the lot of those of us specializing in nervous and mental diseases, to manage and treat this very distressing condition, which in many cases extends over a long period of time. To obtain the benefit we hope and desire is many times most baffling indeed. In fact, the slow progress toward recovery that these cases make, and the ultimate gloomy prognosis that we often feel obliged to make, has led the writer to attempt an appeal to the surgeon, he with the first-hand knowledge of the injury, he whose province it becomes to direct and manage the treatment of these patients, in the first few weeks following the initial injury.

Is there anything that the surgeon can do, or may have observed, that may shorten the period of disability, or hasten the convalescence? May the neurologist, if he sees the case early enough, stay or drive away the neurotic or mental picture, that is in most cases so intractable?

The contributions to the literature on this subject consist so largely of varying opinions and theories that our lack of knowledge seems but the more manifest. We know that after many head injuries varying in degree from fracture of the skull to a comparatively light blow, may show a psycho-neurotic syndrome, may develop a definite psychosis, may present a picture of vague indefinite pains, that these patients are slow to respond to any form of treatment, and that this state may persist independent of compensation being a feature or not, and either in the presence or absence of litigation.

Is it the patient's conception of the situation and his attitude of mind toward that situation, that develops the emotion which determines his reaction? Is there a so-called inadequate personality type of individual, whose apperception is faulty, who cannot see things as they are, and who cannot be persuaded to accept them as others see them, nor to view them in the verifying light of experience, wisdom and judgment? Is this picture too strongly drawn, and does it do the victim of head injury an injustice? May there be an

actual pathologic condition? Has an aedema that is more or less permanent been produced? Has there been produced a molecular change, a complete cellular upset, that does not readjust itself? May there have been a motivation created by the sudden advent of accident into the life of the individual, with the uncertain outlook into the future? May not the influence and example of environment have something to do with the situation that develops? May not sometimes the unguarded attitude or statements of well-meaning but misguided friends or relatives, or even it may be of medical attendants or nurses, have a deterrent influence upon recovery?

With this perhaps rather lengthy questionnaire in mind, let us proceed to review just what are the prominent characteristics of the syndrome referred to. First of all in reviewing the literature, it seems to be a fair consensus of opinion that subjective complaints are present in eighty per cent of head injuries; eight per cent show decidedly psychotic symptoms, while only ten per cent show no subjective complaint. The most prominent subjective complaints are headache and vertigo, continuing for a very long time after all evidence of injury has disappeared. These symptoms being accentuated when patients are on elevated structures, or when they are in a stooping position, the headache being described as a band about the head. Less common complaints are tremors, weakness, in somnia, nausea, cardiac palpitation, inability to concentrate and to use memory as before, or to stand the stress and strain of exertion.

Not being able to confirm these subjective complaints by any physical examination, which might indicate an organic lesion leads to controversy among observers. Some of them insist that the individual is a malingerer because there can be found no confirmatory physical signs, while others believe that the headache and dizziness, and therefore inability to resume work, is attributable to the original injury to the head. One has to diagnose between a post-traumatic functional neurosis, and wilful simulation. One of the most comprehensive reports on this subject is by Lewy, who states that from the large material at his command he is of the opinion that simulation in toto is rare, but that exaggeration of existing symptoms is often encountered.

In cases where the headache and vertigo is supplemented by unsteady gait with nausea

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, N. Y., April 22, 1924.

and vomiting, and a tendency to fall to one side, there is far more definite proof of real injury to brain, cerebellar in character. It is a matter of more or less common observation that syphilitics and alcoholics may have developing after head injury the various typical organic or functional syndromes so commonly following in the wake of over-indulgence in alcohol and syphilis, although the injury to head may have been but slight. It would appear that these symptoms lying dormant, as it were, became precipitated into activity by the injury. Epileptic attacks are oftentimes traceable to a head injury, as is well known, although it may have been months or even years since the injury. It has been thought that the possibility of not being able to recognize the so-called fissure fracture, because of the lack of external evidence, and presenting no immediate disability was responsible for the development of a neurosis. These cases often give no history of unconsciousness at time of injury, but weeks or months afterward the psycho-neurotic syndrome may appear. It would seem that thorough stereoscopic radiographic examination should never be omitted in injuries of the head however slight, even though showing no symptoms whatsoever.

Concussion of the brain, so often a sequel of trauma to the head, and with its customary history of loss of consciousness, of but short duration, virtually becomes a compression, if accompanied by intra-cranial hemorrhage, and would present practically the same need for operative measures as if it were due to depressed bone fragment. The latter condition is usually accompanied by small contracted pupils, slow pulse, restlessness of the patient, and a paralysis of some focal nerve center due to the compression. If the patient survives the injury or the acute manifestations, he may suffer from the same sequellae as in cerebral concussion, and in addition he is exposed to more post-traumatic defects in consequence of the cortical irritation and thickening of the meninges which later may develop into a pachymeningitis, and are accountable for the epileptiform attack, or paralysis which often occurs after these injuries. In a consideration of the definite mental states following head injury, that are genuinely psychotic in character, and may with safety be labeled as such, the complex presented is usually either that of dementia precox, or the manic-depressive type, and but rarely a general paresis. Again this leads to controversy, and one can but venture the hypothesis that individuals having an inherited neurological defect, and who may receive an injury to the head, are at least potential candidates, in which a psychosis may develop, and that the head injury must be re-

garded as a contributing or precipitating factor. Although cases are exceedingly infrequent, I have records of a few showing a definite syndrome of general paresis, and two cases of tabes dorsalis, in which the history of syphilis was negative, together with negative serologic findings in blood and spinal fluid, but who did give a history of trauma to the head. I am fully aware that this is not the orthodox belief relative to the causation of general paresis or tabes dorsalis, nor is it my own belief that these diseases can proceed from any other than a specific cause, but I merely cite these cases as worthy at least of consideration. Lewy summarizes by saying that an injury to skull in a person having suffered from syphilis, or who has been addicted to alcohol in excess, may be the precipitating factor in the development of a psychosis.

Frazier and Ingham, in their splendid work on the traumatic neuroses imply their firm belief as to ultimate recovery from the subjective symptoms of head injury, if judiciously managed. Coming from high authority this is a much more optimistic view than is shared by most of us, I am sure. Dana speculates as to whether there might not be an underworld school for those having had head injuries, and who desire permanent disability compensation. Cushing has reported his physiologic investigations, and I believe outlines a particular surgical technique for all head injuries. Sharpe hints at too frequent surgical intervention as a source of high mortality in head injuries, without due regard to shock or edema. Away back in 1889 it was Oppenheim who first used the term traumatic neurosis, which term is presumed to embrace all of the psycho-neurotic syndromes which follow shock or accident. It was also Oppenheim who asserted with good reasoning that these terms referred to a specific disease with molecular physical changes in the brain. This has not been generally accepted and but few are in harmony with this point of view. As late as 1915, however, he re-affirmed his views that after trauma there is a definite reaction on physiological functioning, which may be either physical or mechanical—either of which may have the same effect on the nervous system. This may occur without hemorrhage, inflammation or degeneration, being merely a displacement of molecules, a tearing apart of associated functioning parts like the removal of a link in a chain. He states that although this condition is not microscopically demonstrable, and does not represent definite alteration of tissue, nevertheless in every case it produces a condition of inhibitions to motor impulses. These observations resulting largely from experiences with the war neuroses, repre-

sent a brilliant though not of necessity a convincing attempt on the part of Oppenheim, to isolate a syndrome peculiar to the traumatic neuroses

Wilson, an aurist of England, ventures on a hypothesis which presents the same line of reasoning. He believes that the symptom picture following physical trauma to the head, including deafness, unsteady equilibrium, with vertigo and a narrowing of the field of vision, is explained that as a result of trauma to the head there is structural discontinuity of the nerves at the synapses—that there is a spread of nerve impulses into adjacent pathways and that in the case of the function of hearing the auditory impulse no longer reaching its goal, deafness results. Such a dissolution may occur at any or all synapses. His method of reasoning although conjectural, may be applied to many of other the symptoms of the traumatic neuroses, such as functional loss of vision, functional paralysis, et cet. Mayer, of Pittsburgh explains the psychoneuroses, starting with the assumption that an acute stoppage of cerebral activity may result after trauma which need not be structural in origin, but is of such a degree that the individual cannot readjust himself to it. This disordered situation brings emotional reactions and its motor responses. If the brain adjusts itself the emotions subside gradually, if not, the attempt to do so increases the emotional reaction—the body vainly tries to secure an adjustment, the glandular secretions work overtime. From this over-stimulation serious damage may result. An ideogenous factor now stepping into play establishes a vicious circle. According to Sherrington, such a draining of energy is probably similar in result to the over-activity of cells which in diaschisis produces a physiologic stoppage of function. This is transient if the cells can replace energetic substances—permanent if they become damaged, or if the synaptic connections cannot become re-established. One may go through the literature ad libitum, and find various converging and again diverging opinions as to the status of the subjective complaints following injury to the head. The question is asked, and very properly, too, as to how much is due to injury and how much to predisposition.

The late Pearce Bailey, in his classic monograph on the war neuroses, implicates motive as an outstanding cause of neurosis, as well as an incentive to cure. In the first instance a neurosis develops, as it were, automatically—the soldier believing that due to this he may receive his discharge. On the other hand, the experience has been that if it is made to appear that he will not be discharged while suffering from a neurosis, a long step at least has been

made toward recovery. It is believed that the great success of the French Army with their cases of neuroses, is due to the fact that the neuroses are not pensionable and that no soldiers are discharged for such causes. It would appear that the real cause of many of the subjective complaints which follow head injury do not depend so much upon extent of the injury or violence, as upon its subjunctive reflection upon the mind of the person injured. There are several factors in this development, one of these being an inherent predisposition easily magnified into motive, for which the individual may have been groping for years. On the other hand, it would seem that there must be at least a fairly definite causative mechanism to account for a symptom picture so universal and uniform. In the few cases that escape the long train of subjective symptoms may there have become established, what we may please to call a psychopathologic defense reaction.

The tremendous industrial and transportation enterprises of the present day will give rise to an ever-increasing number of these cases, demanding proper understanding and classification whether the alleged injury is psychical or physical is for us to determine—and shall we search for motive? Our professional relations become of great importance where litigation is entered upon for the sake of securing indemnity. Indemnity sought for material injury such as loss of eye, or arm, or leg, broken skull or spinal column, with definite objective symptoms is legitimate, but one must stand appalled today, at the wholesale litigation based upon alleged or actual injury, where the physical evidence is slight or absent, yet where serious and permanent damage to the mind, health and body are claimed. Railroads and corporations pay large sums annually to complainants of this class. This very situation places upon the medical profession a tremendous responsibility, whether serving as physician to claimant, or as an expert, so-called, in court, where the justice and extent of the claim is to be determined.

In conclusion permit me to say that it is not only my belief, but the belief of others, that although there may be a certain number of genuine legitimate cases of real definite head injury, where the victim presents a set of psycho-neurotic complaints that are beyond his control, still there are a far greater number of cases of neuroses—so-called—that are born and nurtured in the days following accident, engendered by pique, spite, anger, or revenge—led on by the golden dreams of avarice and a liberal jury verdict—an amount often out of all proportion to the thrift and earning capacity of the individual, as shown by his pre-

vious mode of life. The physician often becomes unconsciously and unwittingly—never premeditatedly I am sure—an accomplice to this end. Many of the populace seem to regard corporations as their natural prey, and have no scruples about mulcting said corporations out of huge sums. I am not venturing on any insecure hypothesis, as to the causes of these apparent states of mind as related—but am relating them only as I have observed them, with the hope of finding interpretation elsewhere. The vagaries of the human mind form an intensely interesting and fascinating study. It is the province of the physician to seek a physical cause for mental ills but we should in no case neglect the moral side, and be on the alert for motive, for we are in a

sense the moral as well as the physical guardians of the people.

sent a brilliant though not of necessity a convincing attempt on the part of Oppenheim, to isolate a syndrome peculiar to the traumatic neuroses.

Wilson, an aurist of England, ventures on a hypothesis which presents the same line of reasoning. He believes that the symptom picture following physical trauma to the head, including deafness, unsteady equilibrium, with vertigo and a narrowing of the field of vision, is explained that as a result of trauma to the head there is structural discontinuity of the nerves at the synapses: that there is a spread of nerve impulses into adjacent pathways. and that in the case of the function of hearing the auditory impulse no longer reaching its goal, deafness results. Such a dissolution may occur at any or all synapses. His method of reasoning although conjectural, may be applied to many of other the symptoms of the traumatic neuroses, such as functional loss of vision, functional paralysis, et cet. Mayer, of Pittsburgh explains the psychoneuroses, starting with the assumption that an acute stoppage of cerebral activity may result after trauma which need not be structural in origin, but is of such a degree that the individual cannot readjust himself to it. This disordered situation brings emotional reactions and its motor responses. If the brain adjusts itself the emotions subside gradually; if not, the attempt to do so increases the emotional reaction the body vainly tries to secure an adjustment, the glandular secretions work overtime. From this over-stimulation serious damage may result. An ideogenous factor now stepping into play establishes a vicious circle. According to Sherrington, such a draining of energy is probably similar in result to the over-activity of cells which in diaschisis produces a physiologic stoppage of function. This is transient if the cells can replace energetic substances: permanent if they become damaged, or if the synaptic connections cannot become re-established. One may go through the literature ad libitum, and find various converging and again diverging opinions as to the status of the subjective complaints following injury to the head. The question is asked, and very properly, too, as to how much is due to injury and how much to predisposition.

The late Pearce Bailey, in his classic monograph on the war neuroses, implicates motive as an outstanding cause of neurosis, as well as an incentive to cure. In the first instance a neurosis develops, as it were, automatically—the soldier believing that due to this he may receive his discharge. On the other hand, the experience has been that if it is made to appear that he will not be discharged while suffering from a neurosis, a long step at least has been

made toward recovery. It is believed that the great success of the French Army with their cases of neuroses, is due to the fact that the neuroses are not pensionable and that no soldiers are discharged for such causes. It would appear that the real cause of many of the subjective complaints which follow head injury do not depend so much upon extent of the injury or violence, as upon its subjunctive reflection upon the mind of the person injured. There are several factors in this development, one of these being an inherent predisposition easily magnified into motive, for which the individual may have been groping for years. On the other hand, it would seem that there must be at least a fairly definite causative mechanism to account for a symptom picture so universal and uniform. In the few cases that escape the long train of subjective symptoms may there have become established, what we may please to call a psychopathologic defense reaction.

The tremendous industrial and transportation enterprises of the present day will give rise to an ever-increasing number of these cases, demanding proper understanding and classification whether the alleged injury is psychical or physical is for us to determine—and shall we search for motive? Our professional relations become of great importance where litigation is entered upon for the sake of securing indemnity. Indemnity sought for material injury such as loss of eye, or arm, or leg, broken skull or spinal column, with definite objective symptoms is legitimate, but one must stand appalled today, at the wholesale litigation based upon alleged or actual injury, where the physical evidence is slight or absent, yet where serious and permanent damage to the mind, health and body are claimed. Railroads and corporations pay large sums annually to complainants of this class. This very situation places upon the medical profession a tremendous responsibility, whether serving as physician to claimant, or as an expert, so-called, in court, where the justice and extent of the claim is to be determined.

In conclusion permit me to say that it is not only my belief, but the belief of others, that although there may be a certain number of genuine legitimate cases of real definite head injury, where the victim presents a set of psycho-neurotic complaints that are beyond his control, still there are a far greater number of cases of neuroses—so-called—that are born and nurtured in the days following accident, engendered by pique, spite, anger, or revenge—led on by the golden dreams of avarice and a liberal jury verdict—an amount often out of all proportion to the thrift and earning capacity of the individual, as shown by his pre-

other states. It may be described as consisting of three groups whose influence start from a center and spread in ever widening circles to every part of the State.

At the center in Albany is Dr. James N. Vander Veer, Chairman of the Legislative Committee of the Medical Society of the State of New York. He has an office force of three persons. Each day he receives the proof sheets of the records of the Senate and Assembly on every bill, and on every Saturday afternoon he receives the printed digest of the action on all bills. He personally goes over these bills and makes a digest of them and places it in the mail on Sunday night as copy for the fifteen pages more or less which are printed in the JOURNAL. He also has 200 copies mimeographed and sent at once to the Chairmen of County Legislative Committees.

Dr. Vander Veer does all this for the good of the cause and without the hope of fee or reward. He is the central man-spring which makes the whole medical legislative system go.

Next to Dr. Vander Veer there is the circle of sixty Chairmen of the Legislative Committees of the County Medical Societies. They too are busy for they must get in touch with their members of the Legislature, and influence them regarding medical bills. Theirs is the responsibility of reaching the legislators directly.

The next circle consists of the ten thousand members of the County Medical Societies. They will get their knowledge from the JOURNAL, and directions for work from the County Chairmen. Their duty is to do occasional details of work as they are asked, such as calling on legislators and writing letters and sending telegrams.

Last year the County Chairmen were called together in Albany for a conference with Dr. Vander Veer on the day of the hearing on the principal medical bills. A similar conference is called on March fourth, on the day of a legislative hearing on the Medical Practice bill, the two bills on chiropractic, and the drugless therapy bill.

The legislative system of the Medical Society of the State of New York may be compared to a radio system. At the central station is the broadcaster, Dr. Vander Veer. Circles of influence from him reach the detecting and amplifying chairmen in every county. Snatches of the broadcasted material are picked up by circles of listening members and by them are put to practice. It is not to be expected that every member shall listen in to every program that is broadcasted, but he is expected to cooperate when the opportunity comes.

## THE PHYSICIAN IN MEDICAL BILLS

The number of bills introduced into the present Legislature affecting medical matters is larger than usual. Many seem to be inspired by welfare organizations who do not recognize the prominent part which practicing physicians must take in the application of the proposed laws. Too often the laws are drawn without reference to the family physician. This is illustrated by Senate Bill Int. No. 283, Assembly Int. 399, which was printed on page 175 of the February 6th issue of this JOURNAL. This bill permits a Board of Supervisors to appoint public health nurses who shall be *directed* by a committee of the Board, and *supervised* by the State Commissioner of Health. The nurses may work in public schools under the direction of the school authorities and under the provision of the State Education Law.

Here at once is a mixed-up condition in which three separate laws are authorized to direct the distracted nurse who tries to serve three masters, and one can readily picture the attitude of the physicians who must work with the nurses and know not who is responsible for their assignments. The obvious method of avoiding serious conflict of authority is to place the direction of the nurses under one law, be it County Law, Public Health Law, or the Educational Law. The

closing paragraph provides that the Board of Supervisors *may* appoint an advisory committee of citizens of whom at least one shall be a physician, and at least one a woman. The number on the committee is not mentioned, and only one need be a physician and his fitness for the position is not mentioned. One can imagine the type of physician which the average political Board of Supervisors would appoint. It would seem that provision should be made by which the organized body of physicians in the county, that is, the County Medical Society, should have a voice in the appointment of the medical member of the advisory committee to the extent of at least the nominating of the member. It would also seem that the appointment of an advisory committee should be mandatory and that physicians should form the majority of the committee.

This law and dozens of similar ones, have been introduced into the Legislature by the leaders of organizations who are fully aware of the existence of the Medical Society of the State of New York, and of the willingness of its officers to give advice to anyone who seeks light on any subject in which physicians are involved. Under present conditions the only course open to the State Medical Society is to oppose the bill in its present form.

## MEDICAL LEGISLATION

The present session of the Legislature has been one of uncertainty and hurry, especially in medical bills. The editors of the JOURNAL and the Chairman of the Legislative Committee have so far been able to do little more than to publish the medical bills which have been introduced, but during the remainder of the legislative sessions we hope to be able to print comments on the individual bills and to give the members of the Medical Society of the State of New York an intelligent idea of their nature.

Our members may also be asked to visit their legislators and give them information regarding the bills. There will be need of promptness in complying with these requests. Most bills are introduced by groups that are backed by money

and selfish interests and their promoters have often avoided publicity and education. Their method is usually to introduce a bill and to get a number of interested voters to write letters in its support. Physicians usually form the only group in opposition to the hasty legislation and they act only from civic motives, and are dignified and deliberate in their actions. Yet a single letter from a physician often has more weight than a score from laymen, for the physicians have the respect and confidence of the community.

If you are asked to write a letter, or send a telegram, please do so at once.

The machinery by which the physicians of New York State keep track of legislation is the most complete of all the States, and is copied by ten

Counsel, Medical Society of the State of New York

## MARCH FOURTH AT ALBANY

The joint committee on Public Health of the Senate and Assembly announce a hearing in the assembly chamber upon the Karle-Dunmore bills sponsored by Dr. Downing and the Regents, which are similar to the bills of last year supported by the State Society. At the same time a hearing on three chiropractic bills introduced by Senator Gibbs and Assemblymen Esmond and Nicoll respectively will be held.

The Karle-Dunmore measures have a serious purpose and are designed to protect educational standards of medical licensure and the practice of medicine from the destructive influences of unethical and unlawful practice. These bills seek to protect the title of "Doctor" from promiscuous use by quacks and to create law-enforcement machinery of state-wide operation. The standards of medical licensure which the Karle-Dunmore bills seek to protect are subjected to destructive attack by the three chiropractic bills, each of which contains the essential vice of similar bills that have been introduced during the last ten years of wholesale license of untried, untested and uneducated men without examination.

It should be kept in mind that the purpose of medical licensing laws is to protect the health of the community by providing safeguards against the practice of healing by those not qualified, and not to create a favored class or arbitrarily confer privileges upon a few to the exclusion of the many. The benefit conferred upon the licensee is but incidental to the program of state control and of regulating a vocation affected with a public interest. The grant of license to the individual is for the purpose of forbidding others who are unqualified from doing damage to the public health. When the legislature seeks to grant licenses to practice healing for the purpose of protecting the public against the practice of the unqualified, it cannot, in doing so, arbitrarily and without reference to skill, learning or fitness, grant licenses to certain uneducated exempted classes. Proper protection to the public in the practice of the healing art can be had only by keeping out the unscientific, uninformed and ignorant, and basing licensure, that presupposes mental ability, upon strict educational qualifications. The selfish interest of the licensee cannot be urged against a program of state control of licensure.

The chiropractors, in their bills seek selfish interest at the expense of the public health, because

they demand license without test of fitness. On March 4th at the hearing the chiropractors will stage a farce that properly should be entitled "How to be a Licensed Doctor without Examination or Education." They believe in much noise as evidenced by their slogan "He Who Bloweth Not His Own Horn, for Him no Horn shall be Blown."

The first act of this comedy is enacted in the bill of Mr. Nicoll in which, under the guise of an attempt "to define and regulate the practice of chiropractic," licenses are granted to upwards of a thousand chiropractors now practicing, without any test or examination, and thereafter educational barriers are to be raised against future competition by knock-out educational tests. In this act is presented likewise a new member of the present Board of Medical Examiners in the person of a chiropractor.

The second act of Mr. Gibbs concerns itself with "The Practice of all Systems, Methods or Sciences Constructed, Formulated or Developed for the Treatment of Disease, the Removal of Abnormality, Injury, or Deformity of Human Beings, except the Practice of Medicine, Osteopathy and Christian Science." "Drugless Methods" is introduced in this act as a means of "treatment of disease, the removal of abnormality, injury, or deformity of human beings by hand or mechanically without the use of drugs, osteopathy, surgery or Christian Science." In this act any person over twenty-one years of age who has four friends who swear he is good, and who has violated the Medical Practice Act for two years and holds a diploma—earned or bought seems immaterial—according to the reading of the text—and pays the state \$25, gets a license to practice. Those who come on the scene later seeking licenses have difficult educational hurdles to get over before they are licensed, but that is helpful to those who have already helped themselves to licenses without examination. The balance of the act consists of a progression of "regulations" in dainty legal costumes, but the real purpose of the regulations is but poorly disguised and is readily recognized.

The third act is by Mr. Esmond. Here the chiropractor is specifically exempted from the operation of the proposed Karle-Dunmore Medical Practice Act and thus is saved by a few lines from the jaws of sudden professional death. He is then taken in charge by Mr. Esmond, and sec-

## PHYSICIAN CAN AID LEGISLATOR

My dear Doctor Have you written to the Senator and Assemblyman who represent you at Albany, advising them as to how you wish they should represent you when the various medical bills—particularly the medical practice act, the chiropractic bill and the drugless therapy bill—come up for consideration? If you have not done so, don't you think it would be only fair to them that you should give them this information at once?

A joint hearing on these three medical bills has been announced for 2 P M on Wednesday, March the 4th It is important, therefore, if you wish your opinion on these bills be given the opportunity of carrying its influence, that you communicate it immediately to your members of the Senate and Assembly, and to both Committees on Public Health You may argue that your legislative representatives are familiar with your opinion on these questions, but that is hardly fair unless you have discussed the matter with them since the bills were presented which are now before the two bodies, because these bills are not exact duplicates of the ones that were introduced last year

Do you ever think that perhaps legislative men arrive at decisions to act by a course of reasoning not very different from that employed by the physician in his conduct with a patient? The physician is always very careful to inform himself about the history of the complaint that the patient makes at the time of the visit Now the legislative man, after his fashion, does what he can, likewise, to inform himself concerning the history of the legislation that is proposed and also the history of its progress, particularly noting the evidences of opposition and approval that have collected during that period of time from the introduction of the bill to its final reading Therefore, every person interested in legislation should make it a point to see that there is history of the character he desires developing along with the bill as it progresses

Today while discussing with an Assemblyman the medical practice act, and attempting to clarify for him that portion of the bill wherein qualifications of a practitioner are stated, making a point of assuring him that those qualifications were not drawn up for the express purpose of excluding chiropractors, but were constructive in character and were intended to raise the standard of the physicians among themselves, his mail was

handed him It consisted of one letter which he passed to me to read after he had looked it over It was from a woman of his district, who said that she had heard there was a bill before the legislature which would license chiropractors, and she hoped that he would support that bill because she was convinced they did good work, saying that they had cured her He told me that he had received, in the last week or ten days, many such letters from people of his district This may seem like a small matter, but it has its effect, and when that effect is multiplied a sufficient number of times without a counter effect, it is apt to produce an opinion or conviction which will result in action The men of the legislature cannot be expected to be familiar with every question that comes up in the form of a bill or resolution demanding their action, nor can they be expected to withhold their vote simply because they are not thoroughly versed with the matter under debate They usually do whatever they can to inform themselves upon the bills, and particularly upon those which appear to them to be the most important, so as to be able to give an intelligent opinion or explanation for whatever action they take when a decision is demanded, but those experienced with legislation know that great aid can be given the Senators and Assemblymen, without either having asked for it, by having their constituents write short letters, giving in a few words the reasons why they think they would have their representatives make certain decisions

Your Legislative Committee is doing its utmost to see that every member of the two Committees on Public Health, and as many other legislative men as possible, are informed as to the desire of the medical profession concerning the disposition of the bills mentioned above, but the most powerful appeals that can be made to any member of the legislature are those which come from the persons in his district by whose ballot he now holds his position and whose support he hopes to deserve in the future

Will you, then, act upon our suggestion and between now and March 4th do what lies within your power to have your representative correctly informed concerning your wishes and those of your friends, as to their action in connection with these medical bills?

J S L

# LEGISLATION

By JAMES N VANDER VEER, M.D.  
Chairman, Committee on Legislation.

## SPECIAL NOTICE TO COUNTY LEGISLATIVE CHAIRMEN

Joint Conference of Legislative Chairmen of County Medical Societies, with the Officers of the Medical Society of the State of New York, and the Advisory Committee on Legislation, will be held on Wednesday, March 4, 1925, at 9 30 A M, at The Hotel Ten Eyck, Albany, N Y Registration with presentation of credentials not later than 9 A M

	973	Public Health	State Institutions Study Malignant Disease	C. 295	Feb 20

tion by section is put together under the label "chiropractic" and crowned with a license halo. At this point a procession of over a thousand chiropractors bearing similar crowns proceeds across the stage of present-day life, having been presented with their crowns by Mr Esmond without any test as far as the Regents of the State are informed.

At this point it is anticipated that the curtain would have to be lowered for a few moments to indicate a return to sanity in order that the joint committee, having been regaled with the ludicrous, might seriously consider a constructive program presented by the Senate act of Mr Karle and the companion Assembly act of Mr Dunmore. It would be expected that by this time the legislators would have had enough of

the comedy to be ready to consider the serious. Dr Augustus S Downing, a veteran warrior against quackery and the defender of standards of professional education at this point takes the center of the stage, followed by the State Commissioner of Health and the representatives of the State Medical Society and other guardians of law and order, constitutional government and honest legislation. The performance before the joint committee will end and there will be one outstanding question.

Do the people want the farce as presented in the three vaudeville chiropractic acts, or do they want intelligent legislation designed to protect the health and well-being of the citizens of this State?

### CLAIMED WRONG DIAGNOSIS AND IMPROPER ADVICE

A man of about 46 years of age called upon a physician specializing in neurology, complaining of pain in the right calf and thigh and in the lumbar region. After examination, the physician made a diagnosis of myositis of gluteus maximus muscle. He also suspected that the patient's condition might be due to the condition of his teeth, and referred him to a dentist. It appears that the patient went to a dentist, who took X-rays of his mouth and reported to the physician that the same showed pyorrhea pockets around the upper right bicuspid and second molar, that the bridge attached to these teeth was causing considerable irritation to the surrounding tissues, the first and second bicuspid had imperfect canal fillings and showed apical infection, and that the bridge was also causing irritation to the tissues underneath it. There was likewise a probability of a left antrum congestion, and the bridge attached to the lower right molar was a cause of irritation to the tissues. There was also an impacted right molar on the lower left side. The dentist had made a clinical diagnosis that the bridges in the patient's mouth were unsanitary and causing a great deal of disturbance to the surrounding tissues and that there were pyorrhea pockets present. He advised the removal of all the bridges and treatment for the pyorrhea and the removal of the impacted molar. About six weeks thereafter, the patient called upon the physician, at which time the physician made a lumbar puncture and advised that the patient permit the dentist to do the work that he deemed necessary.

The patient was not again seen by the physician until a month later, when he stated that he was feeling better, but complained of pain in the right thigh. An injection of 5 cc of 50 per cent solution of alcohol was administered. This

was the last that the physician saw of this patient. After the patient's second visit to the physician, he returned to the dentist, who continued to treat him for several months, during which time he extracted the impacted lower left third molar, removed three bridges, extracted the lower left bicuspid, scaled off deposits from the other teeth and put the patient's mouth in a good, healthy condition.

About a year thereafter, this patient instituted an action against the physician and also instituted a separate action against the dentist, charging that he had gone to the defendant physician to treat him for a certain malady from which he was suffering and that the physician on his first examination stated that the plaintiff's nerves were out of order, that thereafter the physician took a spinal fluid test and advised the plaintiff to have his mouth X-rayed and to undergo the treatment advised by the dentist after X-ray and examination of his mouth, that the defendant, in his treatment of the plaintiff, injected alcohol, which the plaintiff claimed caused him to suffer great pain. He also charges that all of the treatment and advice given him by the defendant physician was improper and injurious and was not called for by the plaintiff's condition and that if the defendant had exercised the proper care and skill in his treatment of the plaintiff, that he would not have treated him in the manner in which he had done. The plaintiff further claimed that by reason of the defendant's advice he had lost his teeth, suffered great pain and was obliged to expend a great sum of money in his endeavor to be cured.

When the action was reached on the calendar and the plaintiff was pressed to proceed with its trial, it was abandoned and the complaint dismissed in favor of the doctor.

### State Charities Inspection of Children's Institutions

Senate Int No 228 (conc Assembly Int 236)  
—A bill introduced in the Senate by Senator J Griswold Webb of Westchester County, concurrent Assembly Int 236, by Assemblyman T C Moore of Westchester County, would amend State Charities Law, by adding new section 16, empowering State Charities Board, among other things, to visit all institutions in which children are received or cared for, and to establish rules therefor

Referred to General Laws Committee of Senate and to Judiciary Committee of Assembly  
No further comment as yet

### Insanity Qualifications for Examiners in Lunacy

Senate Int No 263—A bill introduced in the Senate by Senator James A Higgins of Kings County, would amend section 81, Insanity Law, relative to qualifications of examiners in lunacy

Referred to General Laws Committee

*Comment* Your Committee is in receipt of two communications objecting to the purport of this bill Your Chairman is taking the liberty of quoting from one of the letters

"This bill does not affect me and cannot, unless some wise bird eliminates from it (Sec 81) the words 'certified after date from which this act shall take effect' The element of 'retroactivity of a law' does not in any sense apply as this is one of those conditions which the Police Power of the State may 'limit, regulate and prohibit,' regardless of any pre-existing privilege I just want you to assume that some clever bird succeeds in doing that very thing so that it would apply to me as well as to the young man about to graduate who does not see fit to spend two years in an insane asylum to qualify for Examinership in Lunacy, but who, like me, is disposed to use his mind along every line and has the faculty of using his common sense and 'jury instinct' in the consideration of mental cases Such a man would be debarred from certifying as to the mental condition of one of his own patients who had become disturbed when, as a matter of fact, he knows more in a minute about the 'changes in personality of his patient' than an institutionalist could know in a year

"It is not very long ago (1914) when one of these gentlemen, with a string of hospital attachments and affiliations as long as your arm said, under oath, that he had examined 23,000 cases and Had Never Made a Mistake"

This is one of the several criticisms offered against the bill, and so, therefore, your Committee on Legislation would ask that the Chairmen of the various County Societies give us what opinions they may have "for" or "against" the measure, in view of the comment which appeared in the last number of the Journal

### County Law. Public Health Nurses

Senate Int No 283 (conc Assembly Int 399)  
—A bill introduced in the Senate by Senator J Griswold Webb of Clinton Corners, N Y, concurrent Assembly Int 399, by Assemblyman Frank H Lattin of Orleans County, would amend section 12, County Law, by authorizing County Supervisors to provide expenses for Public Health nurses, who shall work under the public health committee of the board, providing for appointment of advisory committee of citizens and relative to duties of nurses

Referred to Internal Affairs Committees of both houses

*Comment* Much opposition has developed on the part of individual members of the Society to this bill One letter very aptly puts it that the bill is another illustration of lay control, which is reasoning that has lain dormant in the minds of your Committee on Legislation, and from the communications which have been received we have sent a letter of opposition to the bill, as it now stands, to the introducer of it

The nursing and care of the sick primarily originates with the physician and the physician should be represented by his profession on every committee which has to deal with the public health, by reason of his thought along medical lines, and because of his citizenship he should be able to view the good to be done apart from the medical side

He should be the balancing power in such movements

To him these lay boards must turn, and do turn for much advice, in many instances given gratis and sought gratuitously "because the doctor is the best posted on this matter"

This physician, in order to serve, should be freed from the entanglements of state governmental function and should represent solely his professional brethren

The desire on the part of half educated persons to initiate partial or complete medical treatment upon their own judgment and without proper supervision is becoming more and more apparent, and instead of the physician being sought for his advice, we find that in many movements in behalf of the public health the paid secretary of a welfare organization is the one first sought out

This means the commercialization of public health in its ultimate analysis, so much so, that not long ago it has come to the ears of your Chairman, a certain welfare organization hired certain people to go out and dig up cases of sickness and indigency that their money for that year might be expended and thus their call for funds in the ensuing year might theoretically legalize their existence

Your Committee on Legislation takes a stand in opposition to the bill as it is drawn, and asks

## SUMMARY OF BILLS INTRODUCED IN LEGISLATURE IN SENATE

### Public Health, Narcotic Bill

Senate Int No 115 (conc Assembly Int 215)  
—A bill introduced in the Senate by Senator Morton J Kennedy of New York, concurrent Assembly Int 215, by Assemblyman Morris Weinfeld of New York, would add new article 22, and amend section 4-b, Public Health Law, and repeals section 1746, Penal Law, relative to habit forming drugs

Referred to Public Health Committees of both houses

*Comment* Further comment might be made that this bill is of vital interest to the medical profession

Your Committee on Legislation believes it should be passed and that aid should be given Senator Kennedy and Assemblyman Weinfeld by the County Legislative Chairmen communicating with their various representatives asking their support of the bill

### Licensing Institutions of Drug Addicts

Senate Int No 116 (conc Assembly Int 216)  
—A bill introduced in the Senate by Senator Morton J Kennedy of New York, concurrent Assembly Int 216, by Assemblyman Morris Weinfeld of New York, would add new section 177, Insanity Law, requiring the licensing of private institutions for treatment of narcotic drug addiction

Referred to General Laws Committee of Senate, and to Judiciary Committee of Assembly

*Comment* This bill goes hand in hand with the preceding bill relating to habit-forming drugs, and the same comment applies relative to the County Legislative Chairmen aiding its passage

### State Department of Education Bill Amending Medical Practice Act

Senate Int No 211 (conc Assembly Int 307)  
—A bill introduced in the Senate by Senator John L Karle of Queens County, concurrent Assembly Int 307, introduced in the Assembly by Assemblyman Russell Dunmore of Oneida County, would amend Sections 164, 169, 170, 173, 174, and repeal section 171, Public Health Law, relative to practice of medicine, by providing among other things, for the registration and licensing of physicians

Referred to Public Health Committees of both Houses

*Comment* From the paucity of communications received from individuals, and no affirmative or negative resolutions from County So-

cieties, your Committee on Legislation can only feel that the same position maintains in relation to this bill as was taken last year at the very end of the session by the State Society, and consequently your Committee on Legislation can only take the same position as it did last year until frank and open opposition comes to the front.

If it is reasoned that the Chairman and the Committee must use its own discretion in legislation without hearing direct from the County Societies or from individuals, then whatever of criticism shall be offered later can only be placed on those Societies and those individuals who have remained silent in their relations with their County Societies or with the State Society, and who feel themselves not bound by the votes of their constituents, but who feel free to undermine the efforts of the duly accredited delegates or officers of the various County Societies and of the State Society

In conversation with some members of the State Society it has been learned that they are covertly opposing as individuals measures upon which even their own County Societies have passed favorable resolutions, and your officers of the State Society, especially the Committee on Legislation, cannot work to the best advantage of the State Society under such conditions unless the weight of the majority of the Society is openly expressed "for" or "against" a measure.

Legislation is always a matter of the best thought and consequent action of the majority of any group, but many times the best of such may be defeated, and often is negated by the selfish interests of individuals who hold themselves out in very confidential conversation to legislators as representing "an enormous and far-reaching group opposed to the publicly expressed will of the majority"

Thus it can be seen that time and effort on the part of volunteers who are elected or appointed to carry out the will of the majority may go for naught, and the burden of defeat may have to be borne silently by them, and the criticisms heaped upon them may have to go unanswered, since they have no means of expressing the reasons of defeat broadly to those who have placed them in positions of trust

Your Committee on Legislation feels that if the County Societies and individuals are "for" or "against" this measure, they should be guided by what the will of the majority in the County Societies and the judgment of the State Society have dictated

ten and chapter six hundred and twenty-seven of the laws of nineteen hundred and thirteen, is hereby amended to read as follows

§ 570 Medical inspection to be provided Medical inspection shall be provided for all pupils attending the public schools in this state, except in cities [of the first class] *which were cities of the first class on the first day of August, nineteen hundred and thirteen*, as provided in this article Medical inspection shall include the services of a trained registered nurse, if one is employed, and shall also include such services as may be rendered as provided herein in examining pupils for the existence of disease or physical defects and in testing the eyes and ears of such pupils

§ 2 This act shall take immediately

*Comment* Your Committee is in favor of this bill which, if passed, would exempt only cities of the first class which were such on the first day of August, 1913, but would not include any city which might become a city of the first class in the ensuing years

In the old bill any cities which might become first class would be exempted, while under this new bill the only cities exempted for good and all are those which were cities of the first class August 1, 1913

#### **Workmen's Compensation Permitting Employees to Engage Medical Attendance at Employer's Expense**

Senate Int No 594 (conc Assembly Int 301)  
—A bill introduced in the Senate by Senator William Love of Brooklyn, N Y, concurrent Assembly Int 301, by Assemblyman Frank H Lattin of Orleans County, would amend the Workmen's Compensation Law, by permitting injured employees at employer's expense, to engage medical or other attendance

Referred to Labor and Industry Committee of both Houses

*Comment* This bill is the same as Assembly Int 301, commented on in the February 13th Journal, page 182

Free choice of physician at least to a limited degree if not entirely, if that which the medical profession has been aiming at ever since the Workmen's Compensation Law was passed

County Chairmen are asked to write Senator William L Love thanking him for introducing it in the Senate and to write Senator James S Truman, chairman of the Labor and Industry Committee in which the bill lies

They are also urged to write as in the comment on Assembly Int No 301

#### **Tax Deductions from Income of Expenses for Medical, Surgical and Dental Services**

Senate Int No 600 (conc Assembly Int 791)  
—A bill introduced in the Senate by Senator George Fearon of Syracuse, N Y, concurrent

Assembly Int 791, by Assemblyman Phelps Phelps, of New York, would amend section 360, Tax Law, by providing for deduction from income of expenses paid for medical, surgical or dental services, where net income does not exceed \$5,000

Referred to Taxation and Retrenchment Committee of both houses

*Comment* If there is no criticism offered the bill will be dropped

#### **Education Striking Out 20-Minute Periods of Instruction in Physical Training**

Senate Int No 629 (conc Assembly Int 940)  
—A bill introduced in the Senate by Senator Bernard Downing of New York, concurrent Assembly Int No 940, by Assemblyman Peter J Hamill of New York, would amend section 695, Education Law, by striking out provision for 20 minute periods of instruction in physical training

Referred to Public Education Committees of both Houses

*Comment* This bill simply amends the old law by dropping out the period of time (20 minutes) during which physical training shall be indulged in, leaving it thereafter to the Commissioner of Education to determine the length of time If there be no comment thereon, the bill will be dropped

#### **Public Health Pharmacies Conducted by Corporations**

Senate Int No 632 (conc Assembly Int 802)  
—A bill introduced in the Senate by Senator J F Williams of Troy, N Y, concurrent Assembly Int 802, by Assemblyman Edward J Donohue of Rensselaer County, would amend section 234, Public Health Law, by permitting a corporation to conduct pharmacies or drug stores if a licensed pharmacist is employed in each place

Referred to Public Health Committees of both Houses

No 660

Int. 632

IN SENATE,

February 10, 1925

Introduced by Mr J F Williams—read twice and ordered printed, and when printed to be committed to the Committee on Public Health

#### **AN ACT\***

To amend the public health law, in relation to the conduct of pharmacies by corporations

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section two hundred and thirty-four of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," as last amended by chapter two hundred and sixty-nine of the laws

\* Matter in italics is new matter in brackets [ ] is old law to be omitted

the County Chairmen to write to the members of the Senate and Assembly Committees on Internal Affairs in opposition

**Senate Committee on Internal Affairs** Ferris (Chairman), Westall, Hewitt, Thompson, Campbell, Williams, J F Pitcher, Keck, Wendell, Truman, Knight, McGarry, Burchill, Byrne, Twomey

**Assembly Committee on Internal Affairs** Bartholomew (Chairman), Bentley, of Greene County, Underwood, of Yates County, Congdon, of Albany, Messer, of Steuben County, Skinner, of Oneida, Downs, of Suffolk, Slater, of Monroe, Watson, of Cattaraugus, Knapp, of Sullivan, Davis, of Ulster, Hearn, of Kings, Hayes, of Albany

#### **Education Medical Inspection in Public Schools**

Senate Int No 302 (conc Assembly Int 748)  
—A bill introduced in the Senate by Senator Ernest E Cole of Bath, N Y, concurrent Assembly Int 748, by Assemblyman Irving F Rice of Cortland County, would amend sections 571, 571-a, 572, 575, Education Law, relative to medical inspection and health service in public schools

Referred to Public Education Committees of both Houses

*Comment* We have had no comments from any of the County Legislative Chairmen or from individual members of the Society in reference to this bill and would ask their immediate judgment in regard to it

#### **Workmen's Compensation Injured Employee to Select Physician**

Senate Int No 380 (conc Assembly Int 570)  
—A bill introduced in the Senate by Senator Daniel J Farrell, of Kings County, concurrent Assembly Int 570, by Assemblyman Gerald F Dunne of Kings County, would amend section 13, Workmen's Compensation Law, relative to medical and surgical attendance of injured employees, by providing employee shall select his physician

Referred to Labor and Industry Committee of both houses

*Comment* Your Committee on Legislation would ask that the County Chairmen and individual members of the State Society work for the passage of this measure

#### **Public Health Drugless Practitioners Bill**

Senate Int No 473—A bill introduced in the Senate by Senator Leonard W H Gibbs of Erie County, would add new article 13-a, Public Health Law, relative to practice of all systems or sciences constructed or developed for treatment of disease and removal of abnormality, injury or deformity of human beings, except practice of medicine, osteopathy and Christian Science

Referred to Public Health Committee

*Comment* Your Committee would ask that opposition to this measure be voiced to the Senate Public Health Committee from every source, as interests in favor of the bill are working to have it passed, but your Committee feels that the good sense of the legislature, if backed by public sentiment, will keep it from passage

#### **Public Health Medical Examination of Workers in Shell Fish Industry**

Senate Int No 530 (conc Assembly Int. 756)  
—A bill introduced by the Joint Committee on Pollution of Waters, should add new section 343-d, Public Health Law, providing for cleanliness in shellfish industry and for medical examination of workers

Referred to Public Health Committee

*Comment* Unless comment or request is received this bill will be dropped

#### **Education Establishing Institution for Mental Defectives**

Senate Int 551—A bill introduced in the Senate by Senator Leonard W H Gibbs of Erie County, would appropriate \$200,000 for establishing institution for mental defectives

Referred to Finance Committee

*Comment* None, the bill will be dropped

#### **Education Medical Inspection of School Children**

Senate Int No 586 (conc Assembly Int. 850)  
—A bill introduced in the Senate by Senator Ernest E Cole of Bath, N Y, concurrent Assembly Int No 850, by Assemblyman Irving F Rice of Cortland County, would amend section 570, Education Law, relative to medical inspection of school children by excepting only cities which were cities of the first class on August 1, 1913

Referred to Public Education Committee

No 614

Int 586.

IN SENATE,

February 9, 1925.

Introduced by Mr Cole—read twice and ordered printed, and when printed to be committed to the Committee on Public Education

#### **AN ACT\***

To amend the education law, relative to medical inspection of cities

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section five hundred and seventy of chapter twenty-one of the laws of nineteen hundred and nine, entitled "An act relating to education, constituting chapter sixteen of the consolidated laws," as amended by chapter one hundred and forty of the laws of nineteen hundred and

\* Matter in *italics* is new matter in brackets [ ] is old law to be omitted

oath to the board any facts required by the board, shall pay the registration fee of two dollars and shall receive a certificate of registration that must be conspicuously displayed at all times in the pharmacy, drug store or store with all licenses. Every person, partnership, association or corporation doing business as the proprietor or proprietors of a pharmacy, drug store or store shall cause the name of such proprietor or proprietors to be displayed upon a sign conspicuously placed upon the exterior of the building and this sign shall be presumptive evidence of ownership of such pharmacy, drug store or store. The proprietor that opens a pharmacy, drug store or store subsequent to the month of January shall, within thirty days of opening, make this report, pay the fee and display the certificate and the sign. Every proprietor of a wholesale or retail pharmacy, drug store or store is responsible for the strength, quality and purity of all drugs sold or dispensed by him, subject to the guaranty provisions of this article.

§ 2 This act shall take effect immediately.

*Comment* This bill does not concern the medical profession to any degree except where it has to do with physicians who own pharmacies, in that it will allow corporations to own drug stores if a licensed pharmacist be employed.

Unless comment is received the bill will be dropped.

#### **Workmen's Compensation Authorizing Physical Examinations, Results to Be Made Part of Record**

Senate Int No 647 (conc Assembly Int 184)—A bill introduced in the Senate by Senator Frank E Johnson of Brooklyn, N Y, concurrent Assembly Int 184, by Assemblyman F A Miller, of Brooklyn, N Y, would amend section 118, Workmen's Compensation Law, by authorizing physical examinations and practical tests of claimant to determine loss of use and proportionate loss of use of a member, result and test to be a part of record.

Referred to Labor and Industries Committees of both Houses.

*Comment* Comment by a member of the Advisory Committee on Legislation brings forth the fact that the commissioner, board, referee or deputy may make such physical examinations and the result of such examinations and tests shall be made a part of the record.

The wording of the bill is not good and your Committee on Legislation has asked the introducer of the bill in both Senate and Assembly to change the wording so that the examination shall be made by a physician perhaps in the presence of the commissioner, board, referee or deputy, and thus keep it within medical lines.

"If the legislature is to give laymen the power to make physical examinations to determine the loss of use of parts of the human system, it would establish a bad precedent."

#### **Education Crippled Children**

Senate Int No 671

(Conc Assembly Int No 868)—A bill introduced in the Senate by Senator Ernest E Cole of Bath, N Y, concurrent Assembly Int No 868, by Assemblyman John Boyle, Jr, of Suffolk County, would amend sections 2, 5, 23, Children's Court Act, sections 130, 132, 136, State Charities Law, sections 275, 310, 573, 650, 652, 653, 1020, 1200, 1201, 1203, 1204, 1206, 1208, adds new sections 1203-a, 1208-a, Education Law, relative to physically handicapped persons.

Referred to Judiciary Committees of both houses.

*Comment* This bill is an Omnibus Bill amending the laws of the State in behalf of Crippled Children. While there are sections to which the individual medical man might take exception the bill as a whole cannot be objected to.

It is requested that individual members of the Society or groups thereof, after reading the bill on page 288, will forward their opinions, criticisms or the like to your Legislative Bureau.

#### **Coroner of Westchester County**

Senate Int No 673

A bill introduced in the Senate by Senator Seabury C Mastick of Westchester County, would abolish the office of coroner, Westchester County, and create the office of county medical inspector.

Referred to Internal Affairs Committee.

*Comment* This is a local bill and unless your Legislative Bureau hears from the local County Society, the bill will be dropped.

#### **Penal Law Dissected Body May Be Incinerated**

Senate Int. 681

(Conc Assembly Int 986)—A bill introduced in the Senate by Senator Ernest E Cole of Bath, N Y, concurrent Assembly Int 986 by Assemblyman Irving F Rice of Cortland County, would amend sections 2211, 2215, Penal Law, by providing in cases in which right to dissect dead body is conferred by law, such body may be incinerated, section now requires burial.

Referred to Codes Committee of both houses.

*Comment* Deferred until later.

of nineteen hundred and twenty-three, is hereby amended to read as follows

§ 234 Pharmacies, drug stores, stores Except as prescribed in this article, it shall not be lawful for any person to practice as a pharmacist, druggist, apprentice or storekeeper, or to engage in, conduct, carry on, or be employed in the dispensing, compounding or retailing of drugs, chemicals, medicines, prescriptions or poisons within this state. Every place in which drugs, chemicals, medicines, prescriptions or poisons are retailed, or dispensed or compounded, shall be a pharmacy, a drug store, or a store, shall be under the personal supervision of a pharmacist, a druggist, or a storekeeper and shall be annually registered in the month of January by the board as conducted in full compliance with law and the rules

Every pharmacy shall be owned by a licensed pharmacist and every drug store shall be owned by a licensed druggist, and no copartnership shall own a pharmacy unless all the partners are licensed pharmacists and no copartnership shall own a drug store unless all the partners are licensed druggists, *and except that any corporation heretofore or hereafter organized in this state for such purpose may own and conduct pharmacies or drug stores if a licensed pharmacist be employed in each pharmacy or drug store so owned and conducted, and except that any corporation, organized and existing under the laws of [the state of New York or of] any other state of the United States and authorized to do business in the state of New York and empowered by its charter to own and conduct pharmacies or drug stores, and, at the time of the passage of this act, still owns and conducts a registered pharmacy or pharmacies or a registered drug store or drug stores in the state of New York, may continue to own and conduct the same and may establish and own additional pharmacies or drug stores in accordance with the provisions of this article, but any such corporation which shall not continue to own at least one of the pharmacies or drug stores theretofore owned by it or ceases to be actively engaged in the practice of pharmacy, shall not be permitted thereafter to own a pharmacy or a drug store, and except that any person, not a licensed pharmacist or a licensed druggist, who at the time of the passage of this act owns a registered pharmacy or a registered drug store in the state of New York, may continue to own and conduct the same in accordance with the provisions of this article, and except that the administrator, executor or trustee of the estate of any deceased owner of a registered pharmacy or drug store, or the widow, heirs or next of kin of such deceased owner, may continue to own and conduct such registered phar-*

macy or drug store, in accordance with the provisions of this article

**Pharmacies** It shall be lawful for a pharmacist in conformity with the rules, to take, use and exhibit the titles pharmacist and registered pharmacy and to have charge of, engage in, conduct or carry on for himself or for another the dispensing, compounding, or sale of drugs, chemicals, medicines, prescriptions or poisons anywhere within the state, but he shall have personal supervision of not more than one pharmacy or drug store at the same time

**Drug stores** It shall be lawful for a druggist in conformity with the rules to take, use, and exhibit the titles druggist and registered drug store, and to have charge of, engage in, conduct or carry on for himself or for another the dispensing, compounding or retailing of drugs, chemicals, medicines, prescriptions or poisons anywhere within the state, in a place of not more than one thousand inhabitants, but he shall have charge of not more than one drug store at the same time. He may be employed for the purpose of dispensing or retailing drugs, chemicals, medicines, prescriptions and poisons in a registered pharmacy under the management and personal supervision of a licensed pharmacist, he may also perform such duties during the temporary absence of the pharmacist, except in cities of more than one million inhabitants

**Temporary permits** In places and villages of a thousand inhabitants or less that do not have within three miles a pharmacy or drug store

1 Physicians may compound medicines, fill prescriptions and sell poisons labeled as required by this article

2 Storekeepers may in accord with the rules sell medicines and poisons for a period not exceeding one year upon the payment of a fee of three dollars. The storekeeper's certificate is limited to the village or place where the storekeeper resides and may be limited to the sale of certain classes of poisons sold only in original packages and put up by a licensed pharmacist whose name and business address is displayed on the package

**Stores** It shall be lawful for the storekeeper in conformity with the rules to take, use and exhibit the titles certified storekeeper and registered store and to sell medicines and poisons for a period not exceeding one year in a village or place of the state with less than one thousand inhabitants that has no pharmacy or drug store within three miles of it

Every person practicing as a pharmacist or druggist must at all times display his license conspicuously in his place of business. The proprietor of every pharmacy, drug store or store shall annually in the month of January report under

*Comment* This bill is exactly the same as a bill introduced last year in the Senate by Mr O'Brien, which appeared in the April 11, 1924, NEW YORK STATE JOURNAL OF MEDICINE, and your Legislative Bureau has no objections filed last year to the same. The comment therefore rests the same as last year which was as follows:

"The Medical Society has nothing to fear from such a bill, but believes that ample power now rests with the State Department of Education, and therefore remains neutral on the question unless the bill as amended includes all licensed professions as well as those who are extra jure in relation to certain professions."

**Public Health Establishing Division of Rural Hygiene in State Department of Health**

Senate Int 716 (conc Assembly Int 969)—  
A bill introduced in the Senate by Senator Leigh

G Kirkland of Randolph, N Y, concurrent Assembly Int 969, by Assemblyman Frank H Lattin of Orleans County, would add new article 2-b, Public Health Law, establishing a division of rural hygiene in State Health Department and appropriating \$10,000

Referred to Finance Committee of Senate, and to Ways and Means Committee of Assembly

*Comment* This bill smacks in its title of state medicine and of giving further power to the state health department, though as a copy for printing cannot be obtained for this issue unless at the last moment, your Committee on Legislation would ask that when the bill appears it, and the comment be read carefully

---

IN ASSEMBLY

**Labor Requiring Employers to Furnish Nursery First Aid Service in Factories, Etc.**

Assembly Int No 120—A bill introduced in the Assembly by Assemblyman Joseph Reich of Kings County, would add new section 213, Labor Law, requiring employers to furnish nursing first aid service in factories, mercantile, and other establishments

Referred to Labor and Industry Committee

*Comment* No further comment as yet

**Education Providing for Medical Inspection in Schools**

Assembly Int No 127—A bill introduced in the Assembly by Assemblyman Joseph Reich of Kings County, would amend sections 570, 571, Education Law, by providing that boards of education and trustees shall appoint physicians and dentists and may employ nurses for service in schools

Referred to Public Education Committee

*Comment* No further comment except that County Chairmen should oppose this bill in its present form, which prescribes "treatment" in its inclusive measures

**Workmen's Compensation Examination After Injury**

Assembly Int No 184—A bill introduced by F A Miller of Kings County, would amend section 118, Workmen's Compensation Law, by authorizing physical examinations and practical tests of claimants to determine loss of use and proportionate loss of use of a member, result and test to be part of record

Referred to Labor and Industry Committee

See concurrent Senate Int No 647, page 275, for digest and comment

**Chiropractic Bill**

Assembly Int No 185—A bill introduced in the Assembly by Assemblyman William Nicoll of Schenectady County, would define and regulate the practice of Chiropractic

Referred to Public Health Committee

*Comment* The concurrent Senate bill has not yet appeared, but that should not deter the continuance of opposition to this vicious form of breaking down the present Public Health Law, in relation to the practice of medicine

**Workmen's Compensation Providing for Compensation for Poisoning by Chlorine, Iodine Derivatives, Etc**

Assembly Int No 201—A bill introduced in the Assembly by Assemblyman Frederick L Hackenberg of New York County, would amend section 3, Workmen's Compensation Law, by providing for compensation for disabilities or death resulting from poisoning by benzine, or by chlorine or iodine derivatives of petroleum products, etc

Referred to Labor and Industry Committee

*Comment* No further comment and unless there be criticism thereof, the bill will be dropped

**Two Narcotic Bills**

Assembly Int No 215 (conc Senate Int 115)—See concurrent Senate Int 115, page 270, for digest and comment

Assembly Int No 216 (conc Senate Int 116)—See concurrent Senate Int 116, page 270, for digest and comment

**Education Providing Supervisors for Educating Children with Retarded Development**

Assembly Int No 229—A bill introduced in

**Public Health Practice of Medicine by Bachelor of  
Medicine from a Foreign Country**

Senate Int No 693

(Conc Assembly No 950)—A bill introduced in the Senate by Senator John L. Karle of Queens County, concurrent Assembly Int 950, by Assemblyman Frank H. Lattin of Orleans County, would amend section 166, Public Health Law, relative to practice of medicine by a bachelor of medicine from a medical school in a foreign country

Referred to Public Health Committee of both houses

February 12, 1925  
Int No 693

IN SENATE,

Introduced by Mr. Karle.

AN ACT\*

To amend the public health law, in relation to the practice of medicine

Section 1 Subdivision five of section one hundred and sixty-six of chapter forty-nine of the laws of nineteen hundred and nine, entitled, "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," as last amended by chapter two hundred and eighty-two of the laws of nineteen hundred and twenty-four, is hereby amended to read as follows

5 Has either received the degree of bachelor or doctor of medicine from some registered medical school in this country or Canada, or the degree of *bachelor or* doctor of medicine from a medical school in a foreign country (remainder—same as old law)

§ 2 This act shall take effect immediately

*Comment* This bill is one which recognizes that in the medical schools of Canada, the degree of bachelor of medicine (M.B.) is synonymous with our American degree of doctor of medicine, and has been introduced for the purpose of recognizing the degrees so given by colleges of equal standing in foreign countries

Unless there be objection in the straightening out of the law, your Bureau will drop this bill

**Public Health Revocation of Licenses to Practice  
Medicine**

Senate Int 701—A bill introduced in the Senate by Senator Nathan Straus, of New York, would add new section 170-a, Public Health Law, empowering Supreme Court to revoke license to practice medicine

Referred to Public Health Committee

Int. No 701

IN SENATE,

Introduced by Mr. Straus

AN ACT

To amend the public health law, in relation to the revocation of licenses to practice medicine by direction of the supreme court.

Section 1 Chapter forty-nine of the laws of nineteen hundred and nine, entitled, "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended by inserting therein a new section, to follow section one hundred and seventy, to be section one hundred and seventy-a to read as follows

§ 170-a Revocation of license by direction of the supreme court In addition to the method prescribed by the preceding section for revocation by the regents, the supreme court shall have power to direct the revocation of the license of a practitioner of medicine as prescribed in this section The state commissioner of health, the local health office, the state board of medical examiners, or a county medical society, may present to the supreme court of the county in which the physician therein mentioned resides, a verified petition alleging that such physician is guilty of fraud or deceit in his practice or is guilty of a crime or misdemeanor or has violated sections eighty or eleven hundred and forty-two of the penal law or is guilty of malpractice or professional misconduct and praying that the license of such physician be revoked The court shall thereupon refer the matter to an official referee, who shall take proofs of the allegations and report to the court, with his findings If the court confirm the report of such official referee it shall make such order as justice may require If the report of such referee and the order confirming the same shall determine that the allegations of the petition have been substantially sustained, such order shall contain a direction to the regents of the University of the State of New York that the license of such physician to practice medicine in this state be revoked by such regents, and his registration annulled, and such regents shall forthwith make such revocation and annulment If the court shall determine that the allegations of the petition have not been substantially sustained the court shall dismiss the petition and may make an order directing the expenses of the proceeding to be paid by the petitioner

§ 2 This act shall take effect immediately

\* Matter in italics is new, matter in brackets [ ] is old law to be omitted

passing the examination, be issued a license valid for six years from the date of such declaration of intention and upon failure of such licensee to furnish evidence of his having actually become a citizen his license shall become invalid and automatically become revoked and his registration shall be annulled. Applicants examined and licensed by other state examining boards registered by the regents as maintaining standards not lower than those provided by this article and applicants who matriculated in a New York state medical school before June fifth, eighteen hundred and ninety, and who received the degree of doctor of medicine from a registered medical school before August first, eighteen hundred and ninety-five, may without further examination, on payment of twenty-five dollars to the regents and on submitting such evidence as they may require, receive from them an indorsement of their licenses or diplomas conferring all rights and privileges of a regents' license issued after examination. The commissioner of education may in his discretion on the approval of the board of regents indorse a license or diploma of a physician from another state, provided the applicant has met all the preliminary and professional qualifications required for earning a license on examination in this state, has been in reputable practice for a period of ten years, and has reached a position of conceded eminence and authority in his profession. Any physician, who was actually engaged in the practice of medicine in this state prior to September first, eighteen hundred and ninety-one, and who failed to register, although eligible to do so at the time, or any physician, whose registration is not legal because of some error, misunderstanding or unintentional omission, may on the unanimous recommendation of the state board of medical examiners that he has submitted satisfactory proof of having complied with all the requirements prescribed by law at the time of his failure to register, or his incomplete registration, receive from the regents under seal a certificate of the facts which may be registered *in accordance with this act* [by any county clerk and shall make valid his registration.] Before any license is issued it shall be numbered and recorded in a book kept in the regents' office, and its number shall be noted in the license, and a photograph of the licensee filed with the records. This record shall be open to public inspection, and in all legal proceedings shall have the same weight as evidence that is given to a record of conveyance of land.

§ 3 Section one hundred and seventy of such chapter is hereby amended to read as follows

§ 170 *Registration* [Registry, revocation of license, annulment of registry. Every licensee to practice medicine shall, before the licensee begins

practice thereunder, be registered in a book kept in the clerk's office of the county where such practice is to be carried on, with name, residence, place and date of birth, and source, number and date of his license to practice. Before registering, each licensee shall file, to be kept in a bound volume in a county clerk's office, an affidavit of the above facts, and also that he is the person named in such license, and had, before receiving the same, complied, with all requirements as to attendance, terms and amount of study and examinations required by law and the rules of the university as preliminary to the conferment thereof, that no money was paid for such license, except the regular fees paid by all applicants therefore, that no fraud, misrepresentation or mistake in any material regard was employed by any one or occurred in order that such license should be conferred. Every license, or if lost a copy thereof legally certified so as to be admissible as evidence, or a duly attested transcript of the record of its conferment, shall before registering, be exhibited to the county clerk, who, only in case it was issued or indorsed as a license under seal by the regents, shall indorse or stamp on it the date and his name preceded by the words "registered as authority to practice medicine in the clerk's office of \_\_\_\_\_ county." The

clerk shall thereupon give to every physician so registered a transcript of the entries in the register with a certificate, under seal that he has filed the prescribed affidavit. The licensee shall pay to the county clerk a total fee of one dollar for registration, affidavit and certificate. The regents shall have power at any and all times to inquire into the identity of any person claiming to be a licensed or registered physician and after due service of notice in writing, require him to make reasonable proof, satisfactory to them, that he is the person licensed to practice medicine under the license by virtue of which he claims the privilege of this article. When the regents find that a person claiming to be a physician, licensed under this article, is not in fact the person to whom the license was issued, they shall reduce their findings to writing and file them in the office of the clerk of the county in which said person resides or practices medicine. Said certificate shall be prima facie evidence that the person mentioned therein is falsely impersonating a practitioner or a former practitioner of a like or different name. The regents may revoke the license of a practitioner of medicine, or annul his registration, or do both, in any of the following cases

(a) A practitioner of medicine who is guilty of any fraud or deceit in his practice, or who is guilty of a crime or misdemeanor, or who is guilty of any fraud or deceit by which he was admitted to practice, or

the Assembly by Assemblyman A Spencer Feld of New York County, would add new section 579-b, Education Law, providing for county supervisors to supervise education of children with retarded mental development

Referred to Public Health Committee

STATE OF NEW YORK

No 710

Int 649

IN ASSEMBLY,

February 3, 1923.

Introduced by Mr Esmond—read once and referred to the Committee on Public Health.

**AN ACT\***

To amend the public health law, in relation to the practice of medicine.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section one hundred and sixty-four of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty five of the consolidated laws," is hereby amended to read as follows

§ 164 Expenses The fees derived from the operation of this article, *except as otherwise provided in section one hundred and seventy-three, subdivision five*, shall be paid into the state treasury, and the legislature shall annually appropriate therefrom for the education department an amount sufficient to pay all proper expenses incurred pursuant to this article

§ 2 Section one hundred and sixty-nine of such chapter as last amended by chapter two hundred and eighty-two of the laws of nineteen hundred and twenty-four, is hereby amended to read as follows

§ 169 Licenses On receiving from the state board an official report that an applicant has successfully passed the examinations and is recommended for license, the regents shall issue to him a license to practice according to the qualifications of the applicant Every license shall be issued by the university under seal and shall be signed by the president and secretary of the board and by the officer of the university who approved the credential which admitted the candidate to examination, and shall state that the licensee has given satisfactory evidence of fitness as to age, character, preliminary and medical education and all other matters required by law, and that after full examination he has been found properly qualified to practice Applicants examined and licensed in accordance with the provisions of this act, who, when admitted to the licensing examination, were citizens of a foreign country, and who had declared intention of becoming citizens of the United States, shall, upon

\* Matter in *italics* is new, matter in brackets [ ] is old law to be omitted.

October first of each year, after the first registration, shall mail or cause to be mailed to every physician registered in his office, a blank form of application for registration addressed to the last known post-office address of such physician or may cause such blank form of application to be sent to such physicians through the secretary of any duly incorporated medical society. The form of application shall be such as to contain proper spaces for the insertion by the applicant of the information required under paragraph two of this section.

4 The secretary of the board shall issue to any duly licensed physician in this state, upon his application therefor in accordance with the provisions hereof, a certificate of registration under the seal of the university for the year ensuing and ending December thirty-first.

Upon the first of March in each year, or within ten days thereafter, the secretary of the board shall publish and cause to be mailed to each physician registered hereunder in this state, a printed list of the duly registered physicians in this state and each such published list shall contain at the beginning thereof these words:

"Each registered physician receiving this list is requested to report to the secretary of the board and to the secretary of any duly incorporated county medical society existing in the county of his residence or to the secretary of any incorporated state medical society in which said county medical society is represented, the name and address of any person known to be practicing medicine whose name does not appear in this registry. The names of persons giving such information will not be divulged."

The names of physicians which shall in any year be added to said list after the same shall have been so printed and distributed as aforesaid, shall be reported quarterly to the secretary of any duly incorporated state medical society of which county medical societies are components.

5 Any licensed physician who having failed or neglected to register by January first of any year as required by the provisions of this section shall be required to pay upon registration, in addition to the fee of two dollars, a further fee of one dollar for each thirty days or part thereof, that he is in default, and any licensed physician who engages in practice and wilfully refuses or omits to register hereunder, shall be subject to a civil penalty of one dollar for each day that such wilful refusal or omission shall continue, provided that if the same continues for more than thirty days the penalty thereafter shall be five dollars per day so long as the said wilful refusal or omission shall continue, said penalty shall be recoverable in an action by the attorney-general of the state maintained in the name of the people of the state of New York.

6 The penalties provided in this section for failure, neglect or omission of a duly licensed physician to register under this article shall be the only penalties that may be imposed therefor, and the legality of his license shall not be effected thereby, and such penalties may for good cause shown, in the discretion of the regents, upon the recommendation of the board of medical examiners, be remitted or compromised.

7 Each licensed physician shall conspicuously display his proper registration certificate in his office at all times.

§ 4 Section one hundred and seventy-one of such chapter as amended by chapter fifty-three of the laws of nineteen hundred and fifteen is hereby repealed.

§ 5 Section one hundred and seventy-two of such chapter is hereby renumbered section one hundred and seventy-one.

§ 6 Section one hundred and seventy-three of such chapter as last amended by chapter two hundred and eighty-two of the laws of nineteen hundred and twenty-four is hereby renumbered section one hundred and seventy-two and amended to read as follows:

[173] 172 Construction of this article. [This article shall not be construed to affect commissioned medical officers serving in the United States army, navy or marine hospital service, while so commissioned, or any one while actually serving on the resident medical staff of any legally incorporated hospital, or any one while actually serving as an interne in a state hospital or other state institution in which medical service is provided, or any legally registered dentist exclusively engaged in practicing dentistry, or any person or manufacturer who mechanically fits or sells lenses, artificial eyes, limbs, or other apparatus or appliances, or is engaged in the mechanical examination of eyes, for the purpose of constructing or adjusting spectacles, eyeglasses and lenses, or any lawfully qualified physician in other states or countries meeting legally registered physicians in this state in consultation, or any physician residing on a border of a neighboring state and duly licensed under the laws thereof to practice medicine therein, whose practice extends into this state, and who does not open an office or appoint a place to meet patients or receive calls within this state, or any physician duly registered in one county called to attend isolated cases in another county, but not residing or habitually practicing therein, or the furnishing of medical assistance in case of emergency, or the domestic administration of family remedies, or the practice of chiropody, or the practice of the religious tenets of any church. This article shall be construed to repeal all acts or parts of acts authorizing conferment of any degree in medicine causa

(b) Is an habitual drunkard or habitually addicted to the use of morphine, opium, cocaine, or other drugs having a similar effect, or,

(c) Who undertakes or engages in any manner or by any ways or means whatsoever, to procure or perform any criminal abortion as the same is defined by section eighty of the penal law, or,

(d) Who offers or undertakes by any manner or means to violate any of the provisions of section eleven hundred and forty-two of the penal law

Proceedings for revocation of a license or the annulment of registration shall be begun by filing a written charge or charges against the accused. These charges may be preferred by any person or corporation, or the regents may on their own motion direct the executive officer of the board of regents to prefer said charges. Said charges shall be filed with the executive officer of the board of regents, and a copy thereof filed with the secretary of the board of medical examiners. The board of medical examiners, when charges are preferred, shall designate three of their number as a committee to hear and determine said charges. A time and place for the hearing of said charges shall be fixed by said committee as soon as convenient, and a copy of the charges, together with a notice of the time and place when they will be heard and determined, shall be served upon the accused or his counsel, at least ten days before the date actually fixed for said hearing. Where personal service or service upon counsel can not be effected, and such fact is certified on oath by any person duly authorized to make legal service, the regents shall cause to be published for at least seven times, for at least twenty days prior to the hearing, in two daily papers in the county in which the physician was last known to practice, a notice to the effect that at a definite time and place a hearing will be had for the purpose of hearing charges against the physician upon an application to revoke his license. At said hearing the accused shall have the right to cross-examine the witnesses against him and to produce witnesses in his defense, and to appear personally or by counsel. The said committee shall make a written report of its findings and recommendations, to be signed by all its members, and the same shall be forthwith transmitted to the executive officer of the board of regents. If the said committee shall unanimously find that said charges, or any of them are sustained, and shall unanimously recommend that the license of the accused be revoked or his registration be annulled, the regents may thereupon in their discretion, revoke said license or annul said registration, or do both. If the regents shall annul such registration, they shall forthwith transmit to the clerk of the county or counties in which said accused is registered as a physician, a certificate

under their seal certifying that such registration has been annulled, and said clerk shall, upon receipt of said certificate, file the name and forthwith mark said registration "annulled." Any person who shall practice medicine after his registration has been marked "annulled" shall be deemed to have practiced medicine without registration. Where the license of any person has been revoked, or his registration has been annulled as herein provided, the regents may, after the expiration of one year, entertain an application for a new license in a like manner as original application for licenses are entertained, and upon such new application they may in their discretion, exempt the applicant from the necessity of undergoing any examination.]

1 *Every person now lawfully engaged in the practice of medicine within the state and every person hereafter duly authorized to practice medicine, shall, on or before January first of each year, apply to the secretary of the board of medical examiners for a certificate of registration with the regents of the university upon a blank form which shall be furnished by said secretary and shall pay at such time to said secretary a fee of two dollars, provided that any physician who has registered for five consecutive years hereunder shall register annually without the payment of fee and be so registered during the time he shall thereafter continuously practice medicine in this state*

2 *A physician in making his first registration hereunder shall write or cause to be written upon the application blank so furnished by said secretary, his full name, post-office and residence address, the date and number of his license and such other facts for the identification of the applicant as a licensed practitioner of medicine as the regents may deem necessary and shall duly execute and verify the same before an officer empowered to take acknowledgments of deeds and deliver the same to said secretary by mail or in person. Subsequent registrations after the first registration need not be upon a sworn application by the applicant unless in a particular case the regents, for reasons satisfactory to them, may require that the application be under oath, such subsequent registration shall be made with as little inconvenience to duly licensed practitioners of medicine as possible and to that end the secretary of the board may employ and use in obtaining such subsequent registrations, the assistance of the secretary of duly incorporated medical societies who shall be empowered as a representative of the secretary of the board to receive and transmit such application blanks from physicians after the physicians' first registration, together with the license fees payable upon such applications*

3 *The secretary of the board, on or before*

October first of each year, after the first registration, shall mail or cause to be mailed to every physician registered in his office, a blank form of application for registration addressed to the last known post-office address of such physician or may cause such blank form of application to be sent to such physicians through the secretary of any duly incorporated medical society. The form of application shall be such as to contain proper spaces for the insertion by the applicant of the information required under paragraph two of this section.

4 The secretary of the board shall issue to any duly licensed physician in this state, upon his application therefor in accordance with the provisions hereof, a certificate of registration under the seal of the university for the year ensuing and ending December thirty-first.

Upon the first of March in each year, or within ten days thereafter, the secretary of the board shall publish and cause to be mailed to each physician registered hereunder in this state, a printed list of the duly registered physicians in this state and each such published list shall contain at the beginning thereof these words:

"Each registered physician receiving this list is requested to report to the secretary of the board and to the secretary of any duly incorporated county medical society existing in the county of his residence or to the secretary of any incorporated state medical society in which said county medical society is represented, the name and address of any person known to be practicing medicine whose name does not appear in this registry. The names of persons giving such information will not be divulged."

The names of physicians which shall in any year be added to said list after the same shall have been so printed and distributed as aforesaid, shall be reported quarterly to the secretary of any duly incorporated state medical society of which county medical societies are components.

5 Any licensed physician who having failed or neglected to register by January first of any year as required by the provisions of this section shall be required to pay upon registration, in addition to the fee of two dollars, a further fee of one dollar for each thirty days or part thereof, that he is in default, and any licensed physician who engages in practice and wilfully refuses or omits to register hereunder, shall be subject to a civil penalty of one dollar for each day that such wilful refusal or omission shall continue, provided that if the same continues for more than thirty days the penalty thereafter shall be five dollars per day so long as the said wilful refusal or omission shall continue, said penalty shall be recoverable in an action by the attorney-general of the state maintained in the name of the people of the state of New York.

6 The penalties provided in this section for failure, neglect or omission of a duly licensed physician to register under this article shall be the only penalties that may be imposed therefor, and the legality of his license shall not be effected thereby, and such penalties may for good cause shown, in the discretion of the regents, upon the recommendation of the board of medical examiners, be remitted or compromised.

7 Each licensed physician shall conspicuously display his proper registration certificate in his office at all times.

§4 Section one hundred and seventy-one of such chapter as amended by chapter fifty-three of the laws of nineteen hundred and fifteen is hereby repealed.

§5 Section one hundred and seventy-two of such chapter is hereby renumbered section one hundred and seventy-one.

§6 Section one hundred and seventy-three of such chapter as last amended by chapter two hundred and eighty-two of the laws of nineteen hundred and twenty-four is hereby renumbered section one hundred and seventy-two and amended to read as follows:

[173] 172 Construction of this article [This article shall not be construed to affect commissioned medical officers serving in the United States army, navy or marine hospital service, while so commissioned, or any one while actually serving on the resident medical staff of any legally incorporated hospital, or any one while actually serving as an interne in a state hospital or other state institution in which medical service is provided, or any legally registered dentist exclusively engaged in practicing dentistry, or any person or manufacturer who mechanically fits or sells lenses, artificial eyes, limbs, or other apparatus or appliances, or is engaged in the mechanical examination of eyes, for the purpose of constructing or adjusting spectacles, eyeglasses and lenses, or any lawfully qualified physician in other states or countries meeting legally registered physicians in this state in consultation, or any physician residing on a border of a neighboring state and duly licensed under the laws thereof to practice medicine therein, whose practice extends into this state, and who does not open an office or appoint a place to meet patients or receive calls within this state, or any physician duly registered in one county called to attend isolated cases in another county, but not residing or habitually practicing therein, or the furnishing of medical assistance in case of emergency, or the domestic administration of family remedies, or the practice of chiropody, or the practice of the religious tenets of any church. This article shall be construed to repeal all acts or parts of acts authorizing conferment of any degree in medicine causa

honoris or ad eundem or otherwise than on students duly graduated after satisfactory completion of a preliminary medical course not less than that required by this article as a condition of license ]

*I This article shall not be construed so as to prevent the following. (1) The practice of medicine in this state in obedience with the requirements of the laws of the United States, of any commissioned medical officer serving in the United States army, navy, or public health service while engaged in the performance of the actual duties prescribed for him under the United States statutes or (2) the practice of medicine in a duly incorporated hospital operating pursuant to the state charities law, of a duly appointed member of the resident medical staff or of an interne, or (3) the practice of medicine by any physician duly licensed to practice medicine in a bordering state, who resides on a border of such neighboring state, whose practice extends into this state and who does not open an office or appoint a place to meet patients or receive calls within this state, or (4) any lawfully qualified physician in other states or countries meeting legally registered physicians in this state in consultation, or (5) the furnishing of medical assistance in case of emergency, or (6) the domestic administration of family remedies, or (7) the practice of chiropody, dentistry, chiropractic, or veterinary medicine, provided those practicing are legally authorized and licensed under the laws of this state so to do, or (8) the practice of the religious tenets of any church, or (9) the fitting or selling of lenses, artificial eyes, limbs or other apparatus or appliances by any person or manufacturer of the same or the engaging in the mechanical examination of eyes for the purpose of constructing or adjusting spectacles, eyeglasses and lenses*

*II This article shall be construed to repeal all acts or parts of acts authorizing conferment of any degree in medicine causa honoris or ad eundem or otherwise than on students duly graduated after satisfactory completion of a preliminary medical course not less than that required by this article as a condition of license*

It is further provided that any person who shall be actively engaged in the practice of osteopathy in the state of New York on the thirteenth day of May, nineteen hundred and seven, and who shall present to the board of regents satisfactory evidence that he is a graduate in good standing of a regularly conducted school or college of osteopathy within the United States which at the time of his or her graduation required a course of study of two years or longer, including the subjects of anatomy, physiology, pathology, hygiene, chemistry, obstetrics, diagnosis and the theory and practice of osteopathy, with actual attendance of not less than twenty

months, which facts shall be shown by his or her diploma and affidavit, shall upon application and payment of ten dollars be granted, without examination, a license to practice osteopathy, provided application for such license be made within six months after the thirteenth day of May, nineteen hundred and seven. A license to practice osteopathy shall not permit the holder thereof to administer drugs or perform surgery with the use of instruments. Licenses to practice osteopathy shall be registered in accordance with the provisions of this article, and the word osteopath be included in such registration, and such license shall entitle the holder thereof to the use of the degree D O, or doctor of osteopathy.

§ 7 Section one hundred and seventy-four of such chapter is hereby renumbered section one hundred and seventy-three and amended to read as follows

§[174 Penalties and their collection] 173 Penalties [Any person who, not being then lawfully authorized to practice medicine within this state and so registered according to law, shall practice within this state without lawful registration or in violation of any provisions of this article, and any person who shall buy, sell or fraudulently obtain any medical diploma, license, record or registration, or who shall aid or abet such buying, selling or fraudulently obtaining, or who shall practice medicine under cover of any medical diploma, license, record or registration illegally, obtained, or signed or issued unlawfully or under fraudulent representations or mistake of fact in a material regard, or who, after conviction of a felony, shall attempt to practice medicine, or shall so practice, and any person who shall in connection with his name use any designation tending to imply or designate him as a practitioner of medicine within the meaning of this article without having registered in accordance therewith, or any person who shall practice medicine or advertise to practice medicine under a name other than his own, or any person not a registered physician who shall advertise to practice medicine, shall be guilty of a misdemeanor. Any person who shall practice medicine under a false or assumed name, or who shall falsely personate another practitioner or former practitioner of a like or different name, shall be guilty of a felony. When any prosecution under this article, or under sections eleven hundred and forty-seven of the penal law, and any amendments thereto, is made on the complaint of any incorporated medical society of the state, or any county medical society entitled to representation in a state society, any fines collected shall be paid to the society making the complaint, and any excess of the amount of fines so paid over the expense incurred by the said society in enforcing the medical laws of this

state, shall be paid at the end of the year to the county treasurer ]

1 Any person who shall,

(a) Sell or fraudulently obtain or furnish any medical, chiropractic or osteopathic diploma, license, record or registration, or aid or abet in the same, or

(b) Practice medicine under cover of any diploma, license, record or registration illegally or fraudulently obtained or signed or issued unlawfully or under fraudulent representation or mistake of fact in a material regard, or

(c) Advertise to practice medicine under a name other than his own or under a false or assumed name, and

2 Any person, who not being then lawfully licensed and authorized to practice medicine within this state and so registered according to law, shall

(a) Practice or advertise to practice medicine, or

(b) Use in connection with his name any designation tending to imply or designate him as a practitioner of medicine, or

(c) Use the title "doctor" or any abbreviation thereof in connection with his name or with any trade name in the conduct of any occupation or profession involving or pertaining to the public health, unless duly authorized by law to use the same, and

3 Any person, who during the time his license to practice medicine, shall be suspended or revoked shall practice medicine shall be guilty of a misdemeanor

Such misdemeanor shall be punishable by imprisonment for not more than one year or by a fine of not more than five hundred dollars or by both such fine and imprisonment for each separate violation

4 All courts of special sessions within their respective territorial jurisdictions are hereby empowered to hear, try, and determine such crimes without indictment and to impose in full or in part the punishment of fines and imprisonment herein prescribed

Such misdemeanors shall be prosecuted upon the private information of any person by the district attorney of the county wherein the same are committed

5 The display in any manner or by implication of a sign or an advertisement bearing a person's name as a practitioner of medicine or containing any other matter forbidden by law shall be presumptive evidence in any prosecution or hearing that the person whose name is so borne is responsible for the display of such sign or advertisement and of a holding out and of the practice of medicine by such person for each separate

day such sign or advertisement is anywhere displayed by anyone, but such presumptions are rebuttable by the defense It shall be necessary to prove in any prosecution or hearing under this article only a single act prohibited by law or a single holding out or attempt, without proving a general course of conduct, in order to constitute a violation

6 In any action for damages for personal injuries or death against a person not licensed hereunder for any act or acts constituting the practice of medicine as herein defined, where such injuries or death were contributed to by such act or acts, the fact that such person practiced medicine as herein defined without being duly licensed shall be deemed *prima facie* evidence of negligence

7 All violations of this act when reported to the regents and duly substantiated by affidavits or other satisfactory evidence, shall be investigated and if the report is found to be true and the complaint substantiated, the regents shall report such violation to the attorney-general or district attorney The regents may appoint such inspectors as are necessary at such salaries as the regents may determine within the appropriations made therefor and it shall be the duty of such inspectors under the direction of the regents, to investigate promptly and thoroughly such violations and to procure where possible legal evidence of the same for prosecution of the offenders

§ 8 Article eight of such chapter is hereby amended by adding thereto a new section to be section one hundred and seventy-four, to read as follows

§ 174 Revocation of certificates and annulment of registrations

1 Whenever any practitioner of medicine shall be convicted of a felony, there may be presented to the regents a certified or exemplified copy of the judgment of such conviction thereupon the registration of the person so convicted shall be annulled and his license revoked

Upon reversal of the conviction of such practitioner the regents shall upon receipt of a certified copy of the judgment or order of reversal vacate their order of revocation and annulment of registration but nothing herein contained shall divest the regents of power to proceed against such practitioner under the next subdivision

2 The regents may revoke or suspend the license of a practitioner of medicine and annul his registration or reprimand or discipline as in their discretion they may deem best for the public interest in any of the following cases

Upon finding after due hearing

a That a physician is guilty of fraud or deceit in the practice of medicine or in his admission to the practice of medicine or in his procuring registration, or

b That a physician has been convicted in a

court of competent jurisdiction, either within or without this state, of a crime involving moral turpitude, or

c That a physician is a habitual drunkard, or addicted to the use of morphine, cocaine or other drugs having a similar effect, or has become insane, or

d That a physician is guilty of untrue, fraudulent, misleading or deceptive advertising, or advertising that he can cure diseases which are recognized by the medical profession as incurable, or advertising that he can cure or treat disease by a secret method, procedure, treatment or medicine, or that he can treat, operate or prescribe for any human condition by a method, means or procedure which he refuses to divulge upon demand to the regents, or

e Who undertakes or engages in any manner or by any ways or means whatsoever to procure or perform any criminal abortion as same is defined by the penal law

3 Proceedings for revocation of a license, suspension of a practitioner from practice or the annulment of registration under subdivision two of this section shall be begun by filing a written charge or charges against the accused. These charges may be preferred by any person, corporation or public officer, or by the executive officer of the board of regents. Any charges shall be filed with the commissioner of education and a copy thereof filed with the secretary of the board of medical examiners. The president of the board of medical examiners, when charges are preferred, shall designate three of its members as a committee to hear and determine said charges and such committee shall contain at least one member who represents the same school of practice as the physician against whom the charges are preferred. A time and place for the hearing of said charges shall be fixed by said committee as soon as convenient, and a copy of the charges, together with a notice of the time and place when they will be heard and determined, shall be served upon the accused or his counsel at least ten days before the date actually fixed for said hearing. Where personal service or service upon counsel cannot be effected, and such fact is certified on oath by any person duly authorized to make legal service, the secretary of the board of medical examiners shall cause to be published for at least four times, at least thirty days prior to the hearing, a notice of hearing, in a newspaper published in the county in which the physician was last known to practice, and a copy of such notice shall also be mailed to the accused at his last known address. All such notices of charges shall contain a plain and concise statement of the material facts, without unnecessary repetition, but not the evidence by which the charges are to be proven, with a notification that a stenographic record of such proceedings will be kept and that the accused

will have opportunity to appear either personally or by counsel at the hearing, with the right to produce witnesses and evidence upon his own behalf, to cross-examine such witnesses, to examine such evidence as may be produced against him and to have subpoenas issued by the board. The said committee shall make a written report of its findings and recommendations, to be signed by all its members, and the same shall be forthwith transmitted to the board of regents with the entire record and evidence. If the said committee shall unanimously find that the said charges, or any of them are sustained, and shall unanimously recommend that the license of the accused be revoked or the practitioner suspended from practice, and his registration annulled, or that he be otherwise reprimanded or disciplined, the regents may thereupon in their discretion, revoke or suspend said license and annul said registration or otherwise reprimand or discipline as in their discretion they may deem best for the public interest, provided that no greater penalty than that recommended by said committee be imposed. Where the license of any person has been revoked, or his registration has been annulled as herein provided, the regents may, after the expiration of one year, entertain an application for a restoration of license and registration, in like manner as original applications for licenses are entertained, and upon such new application they may in their discretion exempt the applicant from the necessity of undergoing any examination. The regents may in their discretion restore to good standing any physician who has been suspended from practice.

4 Any licensed practitioner found guilty under the provisions of this section on charges or whose license is otherwise revoked or suspended or registration annulled, or who has been refused registration, or who is otherwise reprimanded or disciplined by the board of regents under this article shall have an order of certiorari for the purpose of receiving such determination returnable before the appellate division of the judicial department where the board of regents made the determination complained of, but no such determination of the board of regents shall be stayed or enjoined except upon application to such appellate division, after notice to the state commissioner of education, and upon a showing that the determination of the board of regents was unwarranted, that the constitutional rights of the applicant have been violated or that the board of regents made its determination without jurisdiction. The board of medical examiners or the board of regents may issue subpoenas and administer oaths pursuant to section sixty-one of the public officers law in connection with any hearing or investigation under this article and it shall be the duty of such boards to issue sub-

poenas at the request of and upon behalf of the defense

§ 7 Such chapter is hereby amended by inserting therein a new article, to follow article eight-a, to be article eight-b, to read as follows

§ 189 Definitions As used in this act, "regents" means board of regents of the university of the state of New York "Society" means New York State Chiropractic Society, Incorporated

"Board" means the state board of medical examiners of the state of New York, as provided in section one hundred and sixty-two of the public health law as modified by this act

"Chiropractic school" means any school, college or department of a university teaching and giving instructions in the subjects required for a proper chiropractic standard as herein defined, which schools, upon making proof of giving such teaching and instruction may be registered and approved by the regents

"Proper chiropractic standard" means a course of study extending over a period of twenty-four months, during which an aggregate of at least two thousand one hundred hours of sixty minutes each of instruction is given in the following subjects Anatomy, including histology and embryology, hygiene and sanitation including bacteriology, physiology, biological chemistry including dietetics, diagnosis and symptomatology, pathology, chiropractic analysis, and science and practice of chiropractic

"Practitioner" means one who practices chiropractic

"License" means a license granted and issued by the board of regents of the university of the state of New York under this act to practice chiropractic within this state

"Licensed practitioner" means one who has received a license and is entitled to practice chiropractic within this state under the provisions of this act

The practice of chiropractic is defined as follows A person practices chiropractic within the meaning of this act, who holds himself out as being able to locate and to adjust by hand misaligned or displaced vertebrae of the human spine, for the purpose of relieving nerve pressure caused thereby

§ 189-a The society The New York State Chiropractic Society, Incorporated, is continued, and the officers thereof shall be entitled to hold office until the expiration of their respective terms and the elections and qualifications of their successors, but the existence of said society shall in no way affect the validity of this act

§ 189-b Board of examiners, organization Within twenty days after the first one hundred licenses have been issued under this act, the regents shall appoint one of such licensees as an additional member of the state board of medical examiners Such appointee shall not be a medical doctor Before entering upon his term of office such examiner shall file with the secretary of state his oath of office The term of office shall be three years Before the day when the official term of a member of the board shall expire, the regents shall appoint his successor to serve for a term of three years Such appointment shall be made from the licensed and registered chiropractors of the state The regents in the same manner shall also fill vacancies in the board Such appointee shall not be a doctor of medicine Cause being shown before them, the regents may remove an examiner from office on proven charges of gross misconduct or neglect of duty

§ 189-c Powers of the board 1 Any member of the board may administer oaths, summon witnesses and compel their attendance, and take testimony concerning any matter within the jurisdiction of the board

2 The board of examiners shall, by a majority vote of its members subject to the approval of the regents, make such rules and regulations, not inconsistent with law, as may be necessary for the proper performance of its duties

3 The board of examiners shall have charge of the preparation and grading of examination papers required by this act, which examination shall be uniform in respect of subjects required of applicants for license to practice medicine, and shall hold examinations in at least four places in the state during each calendar year

4 The board shall, after a hearing, upon notice given, recommend to the regents the suspension or revocation of the license of a practitioner and the suspension or annulment of his registration, for any misrepresentation or false or fraud-

ulent statement in his application or examination for a license, for his conviction of a crime involving moral turpitude or for a violation of any of the provisions of this act Upon such recommendation being made the regents may suspend or revoke such license and may suspend or annul such registration Whereupon the practitioner must surrender his license to the regents who shall certify the facts to the county clerk of each county in which the practitioner is registered

5 The board may investigate violations of the provisions of this act and conduct hearings in respect thereto, when, in its discretion, it appears to be necessary, and to bring the same to the notice of any state or county official

§ 189-d Present practitioners exempt from examination For the period of six months after this act takes effect, upon application made in writing and the payment of a fee of ten dollars, the regents shall issue a license, without examination by the board of examiners, to such persons who are twenty-one years of age, of good moral character and otherwise qualified in any one of the following

(a) Graduates after a resident course of two years of six months each, or twelve months altogether, in a school teaching chiropractic, who during the last five years immediately preceeding and at the time of taking effect of this act have been actually engaged in the practice of chiropractic in this state

(b) Graduates after a resident course of three years of six months each, or eighteen months altogether, in a school teaching chiropractic, who during the last three years immediately preceding and at the time of taking effect of this act have been actually engaged in the practice of chiropractic in this state

(c) Graduates after a resident course of two years of four months each, or not less than nine months altogether if taken continuously, in a school teaching chiropractic, who during the last ten years immediately preceding, and at the time of taking effect of this act have been actually engaged in the practice of chiropractic in this state

Proof of the course of study, age and period of practice of each applicant, under subdivisions "a," "b" and "c" of this section, shall be made by the affidavit of the applicant filed with the regents, proof of the good moral character of such applicant shall be made by the affidavit of two reputable citizens, the certificate of the chiropractic school as to such applicant's resident course of study and graduation shall be prima facie proof thereof

§ 189-e Qualifications of applicants for examination and license The board shall admit to the examination for license any applicant who shall have paid to the board of examiners an ex-

amination fee of twenty-five dollars and submitted satisfactory evidence verified by oath or affirmation that he possesses the following qualifications

1 That he is more than twenty-one years of age, and

2 That he is a person of good moral character, and

3 That he has an education equivalent to graduation from a four year high school course registered by the regents or an education accepted by the regents as equivalent, provided such course shall have included elementary biology, elementary physics, elementary chemistry as taught in secondary schools, and

4 That he has actually taken a resident course and graduated from a chiropractic school which maintained during the time of his attendance, a resident course of study extending over a period of twenty-four months, during which course at least two thousand and one hundred hours of sixty minutes each of actual instruction were given, and which included in its curriculum all of the subjects specified in the next section

§ 189-f Examination of applicants All applicants for examination for license shall be required to pass a written examination conducted in the English language in the following subjects Anatomy including histology and embryology, hygiene and sanitation including bacteriology, physiology, biological chemistry including dietetics, diagnosis and symptomatology, pathology, chiropractic analysis, and science and practice of chiropractic The board of examiners shall submit to the regents, as required, a list of questions for examination in the subjects enumerated From these lists the regents shall select questions for all the subjects An additional list of questions shall be submitted by the board, from which the regents shall select a number equal to fifty per centum of the original questions, which additional questions shall be included in the examination on the subjects embryology, histology, anatomy and physiology, and relate exclusively to the nervous system To entitle the applicant to a license he must pass the examination with a rating of at least seventy-five per centum in each subject

§ 189-g Licenses On receiving from the board of examiners an official report that an applicant has successfully passed the examination and is recommended for license, the regents may issue to him a license to practice chiropractic in this state Every license shall be issued by the regents under seal, and shall be signed by the president and secretary of the board of examiners and by an officer of the regents Before any license is issued, it shall be numbered and recorded in a book kept in the regents' office and its number shall be noted in the license This record shall be open to public inspection and in all legal proceedings shall have the same weight

as evidence that is given to a record of conveyance of land. Any license under this act shall entitle the holder thereof to the use of the degree D C or doctor of chiropractic.

**§ 189-h Waiver of examination.** The regents may waive the examination of any applicant for license hereunder who presents satisfactory proof that he has been duly licensed as a practitioner in any other state of the United States having licensing requirements equal to New York state, upon such waiver and the payment of the fee of twenty-five dollars the regents may issue to him a license as provided in section eight of this act.

**§ 189-i Registry of license.** Every licensed practitioner shall before beginning practice under his license, cause such license to be registered in the office of the clerk of the county in which his practice is to be principally carried on, in a book to be provided by the clerk for such purpose, in which shall be entered the name, residence, place and date of birth, number and date of license and an affidavit signed by such licensed practitioner verified before such clerk to the effect that he is the person named in the license, and has complied with all of the provisions of this act. The clerk shall indorse upon such certificate the date and his name, preceded by the words "registered to practice chiropractic, in the clerk's office of \_\_\_\_\_ county." The clerk shall thereupon give to the licensed practitioner so registered a certified transcript under his official seal of the entries in the register. The county clerk shall be paid a fee of one dollar for registration, affidavit and certificate. If the registration of the practitioner be suspended or annulled by the regents, upon receipt of a certificate to that effect the clerk shall stamp upon the record of registry "registration suspended" or "registration annulled" as the case may be with the date of such suspension or annulment. If such registration be thereafter reinstated the clerk shall note that fact on the registration record. If a registered practitioner remove his office or maintain an office in another county he shall register also in such county and notify the board of such fact. He shall present a transcript of registration and pay a fee of twenty-five cents, whereupon the clerk shall endorse thereon "registered also in \_\_\_\_\_ county." "Chiropractors shall annually register under the provisions of the amendment of the medical act requiring all licensed physicians to annually register."

**§ 189-j Display of license and evidence of registration.** Each licensed practitioner must at all times keep conspicuously displayed in his principal office his license and registration certificate, and in any office in which he practices chiropractic his county registration certificate. Every unrevoked license with indorsement of registry thereon shall be presumptive evidence in all courts and places that the person named therein

is legally licensed and registered under the provisions of this act.

**§ 189-k Rights of licensed practitioners.** Each duly licensed practitioner who shall have fully complied with all provisions of this act shall have the right to practice chiropractic within this state and shall be subject to all the disabilities, limitations and restrictions and entitled to the civil rights, privileges and immunities imposed upon and granted to all professional persons by the civil practice act and the judiciary law.

**§ 189-l Revocation and cancellation of licenses.** The regents may revoke the license of a practitioner or annul his registration, or both, in any of the following cases:

(a) A practitioner who is guilty of any fraud or deceit in his practice, or who is guilty of a crime involving moral turpitude, or who is guilty of any fraud or deceit by which he was admitted to practice, or

(b) To an habitual drunkard or habitually addicted to the use of morphine, opium, cocaine, or other drugs having similar effect, or

(c) Who prescribes or administers drugs, or practices surgery or obstetrics, or

(d) Who undertakes to engage in any manner or by any ways or means whatsoever, to procure or perform any criminal abortion as the same is defined by section eighty of the penal law, or

(e) Who offers or undertakes by any manner or means to violate any of the provisions of section eleven hundred and forty-two of the penal law.

**§ 189-m Proceeding for revocation.** Proceedings for revocation of a license or the annulment of registration shall be begun by filing a written charge or charges against the accused. These charges may be preferred by any person or corporation or the regents may on their own motion direct a member of the board of examiners to prefer said charges. Said charges shall be filed with the secretary of the board of examiners. The board of examiners shall hear and determine said charges. A time and place for the hearing of said charges shall be fixed by said board as soon as convenient, and a copy of the charges, together with a notice of the time and place when they will be heard and determined, shall be personally served upon the accused or his counsel, at least ten days before the date actually fixed for said hearing. Where personal service upon counsel cannot be effected, and such fact is certified on oath by any person duly authorized to make legal service, the board shall cause to be published in the manner prescribed for the service by publication of a summons, a notice to the effect that at a definite time and place a hearing will be had for the purpose of hearing charges against the practitioner upon an application to re-

voke his license At said hearing the accused shall have the right to cross-examine the witnesses against him and to produce witnesses in his defense, and to appear personally or by counsel The said board shall make a written report of its findings and recommendations and the same shall be forthwith transmitted to the executive officer of the board of regents If the said board shall find that said charges, or any of them are sustained, and shall recommend that the license of the accused be revoked or his registration be annulled, the regents may thereupon in their discretion, revoke said license or annul said registration, or do both If the regents annul such registration they shall forthwith transmit to the clerk of the county or counties in which said accused is registered as a practitioner, a certificate, under their seal, certifying that such registration has been annulled, and said clerk shall upon receipt of said certificate, file the same and forthwith mark said registration "annulled" Any person who shall practice chiropractic after his registration has been marked "annulled" shall be deemed to have practiced without a registration

§ 189-n Fees and penalties All fees, fines, penalties and other moneys derived from the operation of this act shall be paid into the state treasury and the legislature shall annually appropriate for the department an amount sufficient to pay all proper expenses incurred by them in administering this act, including the salary and expenses of the board

§ 189-o Violations Any person who shall violate any of the provisions of this act shall be guilty of a misdemeanor Any person not duly licensed under this act who engages in the practice of chiropractic shall be guilty of a misdemeanor

§ 8 This act shall take effect January first, nineteen hundred and twenty-six

Comment No concurrent Senate bill has appeared as yet Your Committee on Legislation would especially urge the County Chairmen to forward opposition to this bill to the Committee on Public Health, as the introducer of the same is the one who has always forwarded the interests of cult practice, especially of this cult, and will undoubtedly find an introducer later in the Senate and attempt to pass it in both Houses at the last moment, unless your legislators are made acquainted with its provisions and are unanimous in opposition to it

#### Education Crippled Children

STATE OF NEW YORK,  
No 893

Int. 868

IN ASSEMBLY,

February 11, 1926.

Introduced by Mr Boyle—read once and referred to the Committee on Judiciary

#### AN ACT\*

To amend the children's court act of the state of New York, the state charities law and the education law, in relation to physically handicapped persons.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section two of chapter five hundred and forty-seven of the laws of nineteen hundred and twenty-two, entitled "An act establishing children's courts, defining their jurisdiction, power and duties and regulating procedure therein," as last amended by chapter four hundred and thirty-six of the laws of nineteen hundred and twenty-four, is hereby amended by adding a new subdivision, to be subdivision seven-a, to read as follows

7-a A "physically handicapped child" is one who, by reason of a physical defect or infirmity, whether congenital or acquired by accident, injury or disease, is or may be expected to be totally or partially incapacitated for education or for remunerative occupation

§ 2 Subdivision one of section five of such chapter five hundred and forty-seven of the laws of nineteen hundred and twenty-two is hereby amended to read as follows

1 Children The children's court in each county shall have within such county exclusive original jurisdiction of all cases or proceedings involving the hearing, trial, parole, remand or commitment of children actually or apparently under the age of sixteen years for any violation of law, and in all cases involving juvenile delinquency, children who are material witnesses as provided by law, children who are mental defectives as provided by law, *children who are physically handicapped*, improper guardianship, or neglected children, as provided herein Subject to the limitations herein provided, the court also shall have jurisdiction in proceedings to deter-

\* Matter in italics is new matter in brackets [ ] is old law to be omitted

mine the question of the rightful custody of children whose custody is subject to controversy, as related to their immediate care

The "court" shall have like jurisdiction and authority as is now conferred on "county courts" as concerns "adoption" or and "guardianship"

§ 3 Section twenty-three of such chapter five hundred and forty-seven of the laws of nineteen hundred and twenty-two is hereby amended to read as follows

§ 23 Mental and physical examinations, treatment The court in its discretion, either before or after a hearing, may cause any child within its jurisdiction to be examined by a physician or psychologist appointed or designated for the purpose by the court *In the case of a physically handicapped child the court may accept the certificate of the state department of health as to the need for treatment and care* If it shall appear to the court that any child within its jurisdiction is mentally defective, he may cause such child to be examined as provided in the mental deficiency law and if found to be a mental defective as therein defined, he may commit such child in accordance with the provisions of said law Whenever a child within the jurisdiction of the court and under the provisions of this act appears to the court to be in need of medical or surgical care a suitable order may be made for the treatment of such child in its home, a hospital or other suitable institution, and the expenses thereof, when approved by the court and duly audited, shall be a charge upon the state, the county or the proper subdivision thereof, but the court may adjudicate that the person or persons charged with the liability under the laws to support such child shall pay a part or all of the expenses of such treatment as provided in section forty of this act

§ 4 Section one hundred and thirty of chapter fifty-seven of the laws of nineteen hundred and nine, entitled "An act relating to state charities, constituting chapter fifty-five of the consolidated laws," as last amended by chapter three hundred and sixty-seven of the laws of nineteen hundred and twenty-three, is hereby amended to read as follows

§ 130 Establishment of the New York State Orthopedic Hospital for Children The state hospital, known as the New York State Orthopedic Hospital for Children, established at West Haverstraw, is hereby continued for the care and treatment of any [indigent] children who may have resided in the state of New York for a period of not less than one year, who are crippled or deformed or are suffering from disease from which they are likely to become crippled or deformed No patient suffering from an incurable disease shall be admitted to said hospital Said hospital shall provide for and permit the freedom of religious worship of said inmates to the extent

and in the manner required in other institutions, by section twenty of the prison law

§ 5 The opening paragraph of section one hundred and thirty-two of such chapter fifty-seven of the laws of nineteen hundred and nine, as last amended by chapter four hundred and forty-nine of the laws of nineteen hundred and ten, is hereby amended to read as follows

§ 132 Powers and duties of board of managers The board of managers shall have the general direction and control of the property and affairs of said hospital, which are not otherwise specially provided by law, subject to the inspection, visitation and powers of the state board of charities They may acquire and hold, in the name of and for the people of the state of New York, by grant, gift, devise or bequest, property to be applied to the maintenance of [indigent] children who are crippled or deformed or are suffering from diseases through which they are likely to become crippled or deformed, in and for the general use of the hospital *They may receive or collect from parents, guardians or other persons moneys in payment, wholly or in part, for the care and treatment of patients in the hospital or for braces, crutches or other appliances, and shall transmit any moneys so received to the state treasurer*

They shall

§ 6 Section one hundred and thirty-six of such chapter fifty-seven of the laws of nineteen hundred and nine, as thus renumbered by chapter four hundred and forty-nine of the laws of nineteen hundred and ten and last amended by chapter one hundred and seventy-two of the laws of nineteen hundred and eleven, is hereby amended to read as follows

§ 136 [Who may receive treatment] *Admission and discharge of patients* No patient shall be received except [upon application of a county superintendent of the poor or commissioner of charities in any county or city within the state,] under rules to be established by the board of managers [showing that the patient is unable to pay for private treatment] *Such rules shall provide for preferential admission of children whose parents or those bound by law to maintain them are unable to pay full charges for surgical treatment and hospital care* If there was an attending physician before the patient entered the hospital, [it shall be accompanied by the] a certificate of such physician giving previous history and condition of the patient shall accompany the patient upon his admission to the hospital The superintendent shall have authority, subject to rules established by the board of managers, to discharge any patient at his discretion A written record shall be kept showing as to each pa-

*tient his condition upon admission to the hospital, the treatment given him and the results thereof, his condition at time of discharge and the reason for such discharge. The state advisory commission for physically handicapped persons shall have access to such records at all reasonable times*

§ 7 Section two hundred and seventy-five of chapter twenty-one of the laws of nineteen hundred and nine, entitled "An act relating to education, constituting chapter sixteen of the consolidated laws," as last amended by chapter one hundred and forty of the laws of nineteen hundred and ten, is hereby amended by adding a new subdivision, preceding the closing paragraph, to be subdivision twenty, to read as follows

*20 To provide for physically handicapped children, transportation, home teaching, special classes or special schools, scholarships in non-residence schools, tuition or tuition and maintenance in elementary, secondary, higher, special and technical schools, and on recommendation of the state department of health, surgical, medical or therapeutic treatment, hospital care, crutches, braces and other appliances*

§ 8 Section three hundred and ten of such chapter twenty-one of the laws of nineteen hundred and nine, as last amended by chapter one hundred and forty of the laws of nineteen hundred and ten, is hereby amended by adding a new subdivision to be subdivision twenty-three, to read as follows

*23 To provide for physically handicapped children, transportation, home teaching, special classes or special schools, scholarships in non-residence schools, tuition or tuition and maintenance in elementary, secondary, higher, special and technical schools, and on recommendation of the state department of health, surgical, medical or therapeutic treatment, hospital care, crutches, braces and other appliances*

§ 9 Section five hundred and seventy-three of such chapter twenty-one of the laws of nineteen hundred and nine, as added by chapter six hundred and twenty-seven of the laws of nineteen hundred and thirteen, is hereby amended to read as follows

§ 573 Examinations by medical inspection. Each principal or teacher in charge of a public school shall report to the medical inspector having jurisdiction over such school the names of all pupils who have not furnished health certificates as provided in the preceding section, or who are physically handicapped children as defined by article one of the children's court act, and the medical inspector shall cause such pupils to be separately and carefully examined and tested to ascertain whether any of them are suffering from defective sight or hearing or from any other physical disability tending to prevent them from receiving the full benefit of school work, or re-

quiring a modification of such work to prevent injury to the pupils or to receive the best educational results. If it be ascertained upon such test or examination that any of such pupils are afflicted with defective sight or hearing or other physical disability as above described the principal or teacher, having charge of such school, shall notify the parents or other persons with whom such pupils are living, as to the existence of such defects and physical disability. If the parents or guardians are unable or unwilling to provide the necessary relief and treatment for such pupils, such fact shall be reported by the principal or teacher to the medical inspector, whose duty it shall be to provide relief for such pupils.

§ 10 The opening paragraph and subdivision four of section six hundred and fifty of such chapter twenty-one of the laws of nineteen hundred and nine, as last amended by chapter four hundred and eighty of the laws of nineteen hundred and fourteen, are hereby amended to read as follows

§ 650 School census in cities of the first class, except the city of New York. A permanent census board is hereby established in each city of the first class, except the city of New York. In the city of New York provision shall be made by the board of education for taking a school census in connection with the work of enforcing the compulsory education law. Such permanent census board shall consist of the mayor, the superintendent of schools, the police commissioner or officer performing duties similar to those of a police commissioner. The mayor shall be the chairman of such board. Such board shall have power to make such rules and regulations as may be necessary to carry out the provisions of this article. Such board shall have power to appoint a secretary and such clerks and other employees as may be necessary to carry out the provisions of this article and to fix the salaries of the same. Such board shall ascertain through the police force, the residences and employments of all persons between [the ages of four] birth and eighteen years of age residing within such cities, and shall ascertain with regard to each whether or not he be blind or deaf or have any crippling condition and shall report thereon from time to time to the school authorities of such cities. These children having some crippling condition such board shall report by name, age and address to the advisory commission for physically handicapped persons. Under the regulations of such board, during the month of October, nineteen hundred and nine, it shall be the duty of the police commissioners in such cities of the first class to cause a census of the children of their respective cities to be taken. Thereafter such census shall be amended from day to day by the police, precinct by precinct, as

changes of residence occur among the children of such cities within the ages prescribed in this article and as other persons come within the ages prescribed herein and as other persons within such ages shall become residents of such cities, so that said board shall always have on file a complete census of the names and residences of the children between such ages and of the persons in parental relation thereto. It shall be the duty of persons in parental relation to any child residing within the limits of said cities of the first class to report at the police station house of the precinct within which they severally reside, the following information:

4 In case a child between [the ages of four] *birth* and eighteen years of age becomes a resident of one of said cities of the first class for the first time the residence and such other facts as the census board shall require. Such census shall include all persons between [the ages of four] *birth* and eighteen years of age, the day of the month and the year of the birth of each of such persons, their respective residences by street and number, the names of their parents or guardians, such information relating to *physical defects*, to illiteracy and to the enforcement of the law relating to child labor and compulsory education as the school authorities of the state and of such cities shall require and also such further information *including names and addresses of children having physical defects* as such authorities shall require.

§ 11 Section six hundred and fifty-two of such chapter twenty-one of the laws of nineteen hundred and nine, as last amended by chapter one hundred of the laws of nineteen hundred and nineteen, is hereby amended to read as follows:

§ 652 School census in school districts. The trustee or board of trustees of every school district shall annually on the thirtieth day of August cause a census to be taken of all children between [the ages of five] *birth* and eighteen [to] years of age including all such facts and information as are required in the census provided for in section six hundred and fifty of the education law. This census shall be taken in duplicate in their respective school districts, and one copy thereof filed with the teacher on the first day of school and the other copy filed with the district superintendent on or before the fifteenth day of September. Such census shall include the reports and information required from cities as provided in section six hundred and fifty of this article.

§ 12 Section six hundred and fifty-three of such chapter twenty-one of the laws of nineteen hundred and nine, as last amended by chapter one hundred and forty of the laws of nineteen hundred and ten, is hereby amended to read as follows:

§ 653 Penalty for withholding information. A parent, guardian or other person having under his control or charge a child between [the ages of four] *birth* and eighteen years of age who withholds or refuses to give information in his possession relating to such child and required under this article, or any such parent, guardian or other person who gives false information in relation thereto, shall be liable to and punished by a fine not exceeding twenty dollars or by imprisonment not exceeding thirty days.

§ 13 Subdivision two of section ten hundred and twenty of such chapter twenty-one of the laws of nineteen hundred and nine, as added by chapter five hundred and fifty-nine of the laws of nineteen hundred and seventeen and last amended by chapter three hundred and seventy-eight of the laws of nineteen hundred and eighteen, is hereby amended to read as follows:

2 The board of education of each city and of each union free school district shall furnish suitable educational facilities for deaf, blind, crippled or otherwise physically defective children by means of home-teaching, transportation to school or by special classes. The need of the individual child shall determine which of the indicated services shall be rendered [in which there] Where there are ten or more children who are deaf, blind, crippled or otherwise physically defective such board shall establish such special classes as may be necessary to provide instruction adapted to the mental attainments and physical conditions of such children. Provided, however, that in each city or union free school district in which schools for the deaf, blind, crippled or otherwise physically defective now exist or may hereafter be established, which are incorporated under the laws of the state and are found by the board of education to be adequate to provide instruction adapted to the mental attainments and physical conditions of such children, the board of education shall not be required to supply additional special classes for the children so provided for.

The board of education of such cities or union free school districts is hereby authorized and empowered to contract with such schools for the education of such children in special classes therein.

§ 14 Subdivision three of section ten hundred and twenty of such chapter twenty-one of the laws of nineteen hundred and nine, as added by chapter five hundred and fifty-nine of the laws of nineteen hundred and seventeen, is hereby amended to read as follows:

3 The board of education of each city and of each union free school district, and the board of trustees of each school district, which contains less than ten children who are deaf, blind, crippled or otherwise physically defective, shall fur-

*nish suitable educational facilities for such children by means of home-teaching, or transportation to school. The needs of the individual child shall determine which of the indicated services shall be rendered [is hereby]. Such board is also authorized and empowered to contract with the board of education of another city or school district for the education of such children in special classes organized in the schools of the city or district with which such contract is made.*

§ 15 Subdivision four of section ten hundred and twenty of such chapter twenty-one of the laws of nineteen hundred and nine, as added by chapter one hundred and ninety-three of the laws of nineteen hundred and twenty-four, is hereby amended to read as follows

4 [If] *When* the board of education of a city or union free school district establishes one or more special classes for the instruction of deaf, blind, crippled or otherwise physically defective children, as provided in this article, and shall employ one or more teachers for the instruction thereof, the commissioner of education shall apportion to such city or district, in the same manner as teachers' quotas are apportioned thereto, an amount equal to one-half the salary paid to each of such teachers, but not to exceed one thousand dollars (\$1,000) for each teacher so employed. *He shall also apportion to such city or district an amount equal to one-half the cost of transportation furnished for blind, crippled or otherwise physically defective children.* No such apportionment shall be made on account of a teacher so employed unless there shall have been issued to such teacher by the commissioner of education a certificate authorizing such teacher to teach such special classes or unless such teacher shall possess the qualifications prescribed by the commissioner of education

§ 16 Section twelve hundred, subdivisions one and four of section twelve hundred and one and sections twelve hundred and two and twelve hundred and three of such chapter twenty-one of the laws of nineteen hundred and nine, as added by chapter seven hundred and sixty of the laws of nineteen hundred and twenty, are hereby amended to read as follows

§ 1200 Short title This article shall be known and may be cited as "the [rehabilitation] physically handicapped law"

§ 1201 Definitions As used in this article the terms

1 "Physically handicapped person" shall mean any person who, by reason of a physical defect or infirmity, whether congenital or acquired by accident, injury or disease, is or may be expected to be totally or partially incapacitated for *education or for remunerative occupation*

4 "Commission" shall mean the advisory commission for [the rehabilitation of] physically handicapped persons

§ 1202 Limitation of article This article shall not apply to

1 Aged persons or [helpless] persons *over the age of twenty-one years* requiring permanent, custodial care, or blind persons under the care of the state commission for the blind, or

2 Any person [in any state institution or,] confined in any [correctional or] penal institution, or

3 Epileptic, *insane* or feeble-minded persons or to any person who, in the judgment of the commissioner of education, may not be susceptible of rehabilitation [, or

+ Persons of the age of fourteen years and under]

§ 1203 [State] *An* advisory commission for [the rehabilitation of] physically handicapped persons There is hereby [created] *continued* an advisory commission for [the rehabilitation of] physically handicapped persons, to be composed of the commissioner of education, who shall be chairman, of [a member of] the state industrial commissioner, [to be designated annually by the governor, and] of the commissioner of health and of the *president of the state board of charities*. Any member of the commission may designate an officer in his department to represent him on the commission and the acts of such officer shall be deemed to be the acts of the person who designated him. The commissioner of education shall designate the officer of the department of education charged with the administration of this act to act as secretary of the commission

§ 17 Such chapter twenty-one of the laws of nineteen hundred and nine, as amended by chapter one hundred and forty of the laws of nineteen hundred and ten, is hereby amended by adding a new section, to be section twelve hundred and three-a, to read as follows

§ 1203-a Purpose of the commission *The purpose of the commission shall be*

1 *To rehabilitate persons needing and capable of rehabilitation*

2 *To stimulate all private and public efforts and to co-ordinate them with the work and functions of governmental agencies designed to relieve, cure, or educate physically handicapped children*

§ 18 The opening paragraph of section twelve hundred and four of such chapter twenty-one of the laws of nineteen hundred and nine, as added by chapter seven hundred and sixty of the laws of nineteen hundred and twenty, is hereby amended to read as follows

§ 1204 Power of the commission *The commission shall have power and it shall be its duty*

§ 19 Section twelve hundred and four of such chapter twenty-one of the laws of nineteen hundred and nine, as added by chapter seven hundred and sixty of the laws of nineteen hundred and twenty, is hereby amended by adding two new subdivisions, to be subdivisions seven and eight, to read as follows

7 To carry out the provisions of section twelve hundred and three-a of this article

8 To maintain a register of physically handicapped children and to use all means and measures necessary to insure that the physical and education needs of such children are adequately met, as provided by law

§ 20 Section twelve hundred and six of such chapter twenty-one of the laws of nineteen hundred and nine, as added by chapter seven hundred and sixty of the laws of nineteen hundred and twenty, is hereby amended by adding two new subdivisions, to be subdivisions four and five, to read as follows

4 Make physical examination of physically handicapped children prospectively or actually incapacitated for the normal pursuit of an education, and make recommendations for treatment

5 On its own initiative or on request of the commission provide such surgical, medical or therapeutic treatment or hospital care and necessary appliances and devices for physically handicapped children as in its judgment are needed

§ 21 Section twelve hundred and eight of such chapter twenty-one of the laws of nineteen hundred and nine, as added by chapter seven hundred and sixty of the laws of nineteen hundred and twenty, is hereby amended by adding a new subdivision, to be subdivision eleven, to read as follows

11 To provide home-teaching, transportation, scholarships in non-residence schools, tuition, or maintenance and tuition in elementary, secondary, higher, special and technical schools, for physically handicapped children, in whole or in part from funds of the department, when not otherwise provided by parents, guardians, local authorities or by other sources public or private

§ 22 Such chapter twenty-one of the laws of nineteen hundred and nine, as amended by chapter one hundred and forty of the laws of nineteen hundred and ten, is hereby amended by adding a new section to be section twelve hundred and eight-a, to read as follows

§ 1208-a Duty of the state board of charities It shall be the duty of the state board of charities to report to the advisory commission for handicapped persons from time to time handicapped persons in institutions under the supervision of organizations coming under the visitation of the board and such other information as the board deems advisable

§ 23 The titles to article thirty-nine-a and section ten hundred and twenty of such chapter twenty-one of the laws of nineteen hundred and nine, as added by chapter five hundred and fifty-nine of the laws of nineteen hundred and seventeen, are hereby amended to read as follows  
*[Physically Defective Children] Home-Teaching and Special Classes*

§ 1020 Physically [defective] handicapped children

§ 24 The title to article forty-seven of such chapter twenty-one of the laws of nineteen hundred and nine, as added by chapter seven hundred and sixty of the laws of nineteen hundred and twenty, is hereby amended to read as follows

*[Rehabilitation] Physically Handicapped Persons*

§ 25 In addition and supplemental to the appropriations which shall be made in the appropriation act of nineteen hundred and twenty-five for the purpose of carrying out the powers and duties prescribed in article forty-seven of the education law for the fiscal year beginning July first, nineteen hundred and twenty-five, there is hereby appropriated, from any moneys in the treasury not otherwise appropriated, the sum of one hundred thousand dollars (\$100,000), or so much thereof as may be necessary, to the department of education and the sum of fifty thousand dollars (\$50,000), or so much thereof as may be necessary, to the department of health

§ 26 This act shall take effect July first, nineteen hundred and twenty-five

See comment on Senate Int 671, on page 275

#### Railway Emergency Kits

Assembly Int No 870—A bill introduced in the Assembly by Assemblyman Maurice Z. Bungard of Brooklyn, N Y, would add new section 71-a, Railroad Law, requiring railroads to provide each passenger car with kit containing bandage, medicated cotton, spirits of ammonia, flashlight and peroxide

Referred to Public Service Committee

Comment This bill is the same as was introduced by the same Assemblyman last year and your Committee on Legislation has nothing to say concerning it

#### Penal Sale of Wood Alcohol

Assembly Int No 908—A bill introduced in the Assembly by Assemblyman Frank H. Lattin of Orleans County, would add new sections 446, 447, 447-a, Penal Law, forbidding sale of wood or methyl alcohol, except as methanol, and making it a felony to sell food or drink or medicinal or toilet preparations for internal use in which there is methanol

Referred to Codes Committee

February 11, 1925

Int No 908

IN ASSEMBLY

## AN ACT

Introduced by Mr Lattin—To amend the penal law, in relation to the name, sale, use and labeling of methanol, formerly known as wood naphtha, wood alcohol or methyl alcohol

Section 1 The penal law is hereby amended by inserting therein at the end of article forty, three new sections to be sections four hundred and forty-six, four hundred and forty-seven and four hundred and forty-seven-a, to read as follows

§ 446 On and after September first, nineteen hundred and twenty-five, the liquid known as wood naphtha, otherwise known as wood alcohol or methyl alcohol, either crude or refined, whatever may be the name or trade mark under or by which the said liquid may be called or known, shall hereafter be designated and known as methanol, and the use of the terms wood naphtha, wood alcohol, methyl alcohol, or any other term or designation of the liquid, except methanol, is forbidden and shall be discontinued

§ 447 Any person who shall sell, offer for sale, give away, deal in, or supply, or have in his or her possession with intent to sell, offer for sale, deal in, or supply, any article of food or drink, or any medicinal or toilet preparation intended for internal human use which contains methanol, either crude or refined, whatever may be the name or trade mark under or by which methanol was formerly called or known, is guilty of a felony

§ 447-a No person shall sell, offer for sale, give away, deal in, or supply, or have in his or her possession with intent to sell, offer for sale, give away, deal in, or supply, any methanol, either crude or refined, whatever may have been the name or trade mark under or by which methanol was heretofore called or known, unless the container in which the same is sold, offered for sale, given away, dealt in, or supplied, shall have imprinted upon said container, or upon a label pasted upon the container, the following device and words, in bold characters in red colors, viz

(Skull and cross bones represented)

## POISON

WARNING—It is unlawful to use this fluid in any article of food, beverage, or medicinal or toilet preparation, intended for internal human use

Any violation of the provisions of this section shall be a felony

§ 2 This act shall take effect September first, nineteen hundred and twenty-five.

*Comment* This bill your Medical Society

should favor, in the opinion of the Committee on Legislation, inasmuch as it will clarify a situation which has occurred in all professions which have the handling of wood so called, methyl alcohol.

## Public Health Reciprocity of Licensure

Assembly Int No 925—A bill introduced in the Assembly by Assemblyman Edward J Coughlin of Brooklyn, N Y, would amend section 169, Public Health Law, relative to licensees to practice medicine who have received license in another state

Referred to Public Health Committee

Int No 925

IN ASSEMBLY,

## AN ACT\*

Introduced by Mr Coughlin.—To amend the public health law, in relation to the qualification of licensees to practice medicine

Section 1 Section one hundred and sixty-nine of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health—constituting chapter forty-five of the consolidated laws," as last amended by chapter two hundred and eighty-two of the laws of nineteen hundred and twenty-four, is hereby amended to read as follows

§ 169 Licenses On receiving \* \* \* provided by this article and applicants who [matriculated in a New York state medical school before June fifth, eighteen hundred and ninety, and who received the degree of doctor of medicine from a registered medical school before August first, eighteen hundred and ninety-five, may], *having received a license in another state after graduation from a registered medical school prior to August first, nineteen hundred, have practiced their profession in another state or states for fifteen years or more,* shall without further examination \* \* \*

Section 2 This act shall take effect immediately

\* \* \* indicate same as old law

*Comment* No comment as yet, but from the wording of the bill your Committee will attempt to ascertain the reason of its introduction and advise the members later of the purport of the bill

—See concurrent Senate Int 629 for digest

Assembly Int No 950 (conc Senate Int 693)  
—See concurrent Senate Int. 693 for digest

Assembly Int. No 969 (conc Senate Int 716)  
—See concurrent Senate Int 716 for digest.

\* Matter in italics is new matter in brackets [ ] is old law to be omitted.

**Public Health Giving State Department of Health  
Fiscal Control of State Institute on Study of  
Malignant Disease**

Assembly Int 973—A bill introduced in the Assembly by Assemblyman Julius S. Berg of Bronx County, would amend section 345, Public Health Law, by giving State Health Department fiscal control of State Institute for Study of Malignant Disease

Referred to Ways and Means Committee

*Comment* This is a local bill and except as we shall hear from the Council or Executive Committee of the State Society we shall not take any action even though the future policies of the State Institute may be changed under regulations issuing from the State Department of Health which might affect physicians

---

**HEARINGS**

Wednesday, March 4th, at 2 P M in Assembly Chamber

Joint hearing before Senate and Assembly Public Health Committees Bills to be considered

Senate 211, conc Assembly 307—Amending Medical Practice Act (Karle and Dunmore)

Senate 473—Drugless Therapy (Gibbs)

Assembly Int 649—Chiropractic Bill (Esmond)

Assembly Int 185—Chiropractic Bill (Nicolli)

*Note*—For the information of County Chairmen and members of the Society

In the Senate to February 14th, there have been introduced 727 bills

In the Assembly to February 14th, there have been introduced 986 bills

# State Department of Health

## INDEFINITE DIAGNOSES SHOULD BE CHECKED UP

The busy practitioner occasionally is called upon to see a patient, makes a more-or-less hasty examination, calls the case one of grippe, leaves some medicine or a prescription and doesn't see the patient again. Although perhaps in most instances such a procedure does not result in harm, either to the patient or to others, sometimes such a sin of omission may have serious consequences.

Not long ago there came to the attention of the Department a case of this sort, in which the patient was subsequently found to have smallpox, but, in the meantime, others had been exposed to

the patient and an outbreak of smallpox resulted.

More recently, a physician was called to see a child who was vomiting and who had indefinite, grippy pains and a temperature of 101°. No second call was made by the doctor, who called it "grippe." Three weeks later, the father of the child brought her to the doctor and it was then found that she had a definite paralysis of the right arm, due to poliomyelitis.

These instances suggest the advisability of checking up on all cases with indefinite, acute febrile conditions.

## HEALTH OFFICER GIVES ADVICE ON FAINTING

Dr. Mortimer B. Downer, Health Officer of the Town of Woodstock, Ulster County, is the author of a series of interesting, popular articles on medical subjects which are appearing in his local paper, *The Woodstock Weekly*.

Writing on "Fainting," he gave the following very sensible advice:

"If you want to assist a person that has fainted, do not do, I beg of you, as the hero does in the movies when the leading lady faints. He rushes to her prostrate form and with his strong arms sits her up or stands her on her feet. She promptly recovers and 'comes back to life.' If fainting persons are lying prone, allow them to lie in this position. If they are lying

on their faces, turn them on their backs. If they are in a sitting position, lower their heads, and, if you can get their heads lower than their bodies, so much the better. These measures will allow more blood to flow to the bloodless brain." Dr. Downer follows this with further simple advice, familiar to physicians and which we shall not repeat in these columns.

Dr. Downer is a rural health officer, the only physician in his town. He is one of the comparatively few who are taking advantage of their opportunities to promote public health education among the people, for whose health they are responsible.

## IT PAYS TO INVESTIGATE ADULT CHICKENPOX

Recently a child was reported to the health officer of Amsterdam as a case of chickenpox, but, through error, the attending physician stated the age of the patient as 25 years. As it is a rule in that city to investigate all adult cases of chickenpox, this one was looked up, as a matter of routine, and it was found that there was not only a mistake in the age, but also in diagnosis. The case was one of smallpox and it probably would have remained undiscovered, except for the error in stating the age.

Within the same week, two other cases of chickenpox in adults were reported, these were also examined by the city health officer and the district state health officer and both were found to be cases of smallpox. One of them denied having had prodromal symptoms, but it was found that eight days previously this man had been reported to the health department as suffering with influenza.

## PLUMBISM IN AN INFANT

In the January, 1925, *Industrial Hygiene Bulletin*, published by the New York State Department of Labor, note is made of a case of plumbism in a nursing mother, caused by using a lead nipple shield. We made further inquiry about this case, particularly regarding the baby, and find that lead was recovered from the mother's

milk and that "the infant showed stippling of the red blood cells, anemia and other signs of lead poisoning."

Presumably, the baby became poisoned directly from the lead nipple, while in the case of the mother the absorption was through the skin or mammary tissue, or both.

# NEWS NOTES

## ALLERGY AND PRE-ASTHMATIC CONDITIONS IN PERIODIC HEALTH EXAMINATIONS

By ROBERT A. COOKE, M.D.,

NEW YORK CITY

Abstract of the Thirteenth Lecture in the Symposium on Health Examinations, conducted by the Medical Society of the County of New York, given January 27, 1925

By the words "hypersensitiveness" and "allergy" we mean the abnormal clinical response to absorbed substances, and we consider that a response is abnormal when it is obtainable in only a small percentage of persons. An example is the occasional acute symptoms, such as swellings, urticaria, vomiting, purging, dyspnoea, cyanosis, and collapse, produced in infants by eggs.

The substances which produce allergy may enter the body, 1, by the inhalation of pollen, or animal dander, and other air-borne dust, 2, by foods or drugs swallowed, 3, through the skin, as by drugs, or poison ivy, or the subcutaneous injection of serums, and 4, from foci of chronic infections.

The tissues affected are essentially those of epiblastic origin—the skin, and the mucous membranes of the respiratory and digestive tracts.

The skin manifestations are urticaria, angio-neurotic edema, eczema, dermatitis, or vesicular, erythematous, and papular lesions.

A common manifestation in the upper respiratory tract is hay fever, or rhinitis.

The typical manifestation in the bronchi is asthma.

The manifestations in the digestive tract are acute food poisoning as shown by vomiting, purging, and cyanosis, and often collapse. The symptoms may be confined to a portion of the tract and appear as gastritis, enteritis, or colitis. In some cases they are not acute, but are mild and appear as anorexia, under nutrition, nervous irritability, and sleeplessness. When these symptoms appear in childhood, the children are always below par in weight, bone, and muscle development, and mental activity. At times the clinical symptoms are paroxysmal and explosive, as in the periodic vomiting of children. The chronic, and some of the acute symptoms of food allergy are caused by some of the more commonly used foods and often to some particular food toward which the child has an instinctive dislike.

The special object of this talk is two fold, first, how can we recognize the allergies in their pre-clinical or developmental stage and, second, what measures can be taken to thwart the development or manifestation of the clinical symptoms.

These conditions are common, and every phy-

sician who makes a worthy periodic health examination must inquire into them.

There is a hereditary element in the causation of allergy. In the investigation of several hundred normal individuals, a history of allergy was found in the ancestors of only seven per cent, while in 796 allergic cases, 58 per cent had ancestors who gave a positive allergic history.

When both parents of an allergic case gave a history of allergy, the clinical symptoms of 89 per cent began before the age of ten years.

When one parent was allergic, 31 per cent of the cases began before the age of ten.

When no inheritance was evident, only 20 per cent of the cases showed symptoms before 10 years of age. The more complete the inheritance, the earlier was the age of onset.

Among children who have an allergic inheritance from both parents, 70 per cent will be likely to show allergy, while if only one parent is allergic only 58 per cent will be allergic.

A positive family history of allergy should arouse suspicion as to the nature of disease manifestations in a child.

The clinical manifestations of allergy are often different from those in the parent. The inheritance is not of the condition itself, but rather a tendency to some allergic state.

The majority of allergic cases will react to more than one substance. Some are known to react to twenty-five substances.

An individual may show only one clinical manifestation to many different substances. He may have asthmas from pollen and show angio-neurotic edema from fish or shell fish. An infant may give a clear history of egg allergy, which is later replaced by an asthma from dander, and still later the individual may become sensitive to pollen and have seasonal hay fever.

The diagnosis and management of these changing and complicated cases is often difficult.

Asthma is probably the most common and important of the recognized allergies, because, 1, it tends to a chronic condition which interferes seriously with education work and comfort, and 2, the complications and sequelae are many and serious, and include emphysema, chronic infections of the respiratory tract and chronic infection of the paranasal sinuses.

The causative factors of asthma vary with the age of onset. Rarely do pollens or animal danders cause trouble before the third year of age. An offending food usually produces symptoms the first time it is taken. Children subject to food allergy may have eczema which is severe and protracted.

Attacks of asthma in infants caused by infection are gradual in development, and the infection is limited to the upper respiratory tract and bronchi. They usually begin with frequent attacks of bronchitis with increasing wheezing until they finally become true asthma. These infants usually have definite lymphoid hyperplasia in the pharynx and tonsils.

Asthma that develops from the third to the thirtieth year is usually caused by air-borne substances, and the onset is gradual. Usually the first symptoms are coryza, later colds in the head, and finally true asthma.

Asthma developing after the thirtieth year is usually the result of chronic foci of infection in the bronchi, tonsils, teeth, or sinuses. It is important that the early manifestations be recognized as pre-asthmatic, for their further development may often be stopped and their complications prevented.

In the infant, the only pre-asthmatic clue lies in the family history.

A food allergy is a definite condition that should be diagnosed readily. The treatment is to withdraw the offending food absolutely, and for an indefinite time.

Infections occurring frequently in the upper respiratory tract and bronchi in infants with an allergic inheritance, calls attention to infected

adenoids and tonsils. Since these children are likely to become sensitive to air-borne substances later in life, the plain indication is to keep them away from pollens and dusts which are known to produce asthma in older people. Cats and other pets are to be excluded from the house. Mattresses and pillows are to be of clean hair, box springs excluded from the bed, and stuffed furniture from the rooms, and only small rugs allowed on the floor. The object is to keep the surroundings free from dust. The diet is to be simple, and of a variety of foods.

Drugs are to be prescribed to asthmatics with care. These persons are often peculiarly sensitive to aspirin, and quinine, and to poultices made of flax seed or mustard. Bronchitis may be turned into violent asthma by a poultice of flax seed or mustard.

As a summary, we may say that much may be done for cases of allergy by an early recognition of the condition, and a prevention of the clinical symptoms. These clues for early diagnosis are four fold:

- 1 In the family history
- 2 In the past history of the individual, especially manifestations of allergy early in life such as poisoning by milk, or egg, or eczema, or periodic vomiting, or urticaria
- 3 In the present history, a definite allergy, such as hay fever, brings suspicion or recurring colds and bronchitis as a possible forerunner of asthma
- 4 Chronic foci of infection in any part of the respiratory tract are always suspicious and demand attention promptly and efficiently

## WOMEN'S MEDICAL SOCIETY

Saturday, February 7th, the Council of the Women's Medical Society of New York State met in the Vassar Rooms of the Hotel Allerton, 57th Street and Lexington Avenue. The President, Dr. Julia Kimball Qua, presiding.

Dr. Eliza M. Mosher of Brooklyn, who is celebrating this year her fiftieth year in active practice, and Dr. Sarah J. McNutt of New York, who will celebrate her fiftieth year of practice in 1927, were among those present.

The Scientific Program Committee, which consists of Edith R. Hatch, Lulu Hunt Peters, Rosalie Slaughter Morton, are preparing a most interesting program for the State Meeting.

Dr. Florence A. Sherman of Albany, Chairman of the Legislative Committee, reported that she has visions of much work ahead of her.

Dr. Mary T. Green of Castle, told of the progress of our three women medical students, whom we are educating and initial steps were taken to have the Women's Medical Society of the State of New York incorporated, so that we may legally receive legacies for our Educational Committee, and in time become well endowed.

This was the best attended and most enthusiastic Council meeting we have ever had and if coming events cast their shadows before, the annual meeting, May 11th in Syracuse, will be the best meeting we have ever had.

## TESTIMONIAL DINNER

A testimonial dinner will be tendered by the Eastern Medical Society to Dr. Samuel J. Kopselsky, President of the County Medical Society, on March 12, 1925, at the Commodore Hotel. The

medical profession and their ladies are invited to be present. Tickets may be obtained by communicating with the treasurer, Dr. Philip Horowitz, 57 West 73d Street, N. Y. City.

# THE DAILY PRESS

While typhoid fever has ceased to be a leading heading in the newspapers, oysters continue to be a favorite subject of comment

The New York *Herald-Tribune*, February 11, carries a statement of the conclusions of the United States Public Health Service regarding typhoid and oysters, based on an investigation by officials of the service. The report says that the infection came from one dealer who has a shipping station on Long Island. The newspaper says:

"The preponderance of the evidence is that the general supply of no large distributor of oysters was uniformly infected," said a Public Health Bureau statement today, 'but that oysters infected in one or more beds or part or parts of one or more beds, or at one or more floats, and constituting but a small proportion of the total, were introduced into and distributed with a large supply of oysters of good sanitary quality

"A detailed report of the investigation will be submitted by the service as soon as practicable, it was announced, today's statement being intended to clarify a situation which it said not only had brought about a practical cessation of the oyster industry, but had seriously affected traffic in other fish products

"The report based its opinion that raw oysters sold since December 20 'have been free from any considerable degree of typhoid infection' and are safe to eat, on temperature changes in some bed or beds, discontinuance of receipts from the infected source or sources, and sanitary measures which have been carried out by the oyster producers within the vicinity of their floats and on their dredging boats"

The *Brooklyn Eagle*, February 13, quotes from an open letter of Dr Matthias Nicoll, Jr. Commissioner of Health of New York State, to Surgeon General Hugh S. Cumming of the U. S. Public Health Service, criticizing him for fastening the responsibility for the spread of typhoid on one Long Island dealer in oysters, "without submitting the slightest proof." The newspaper quotes from Dr. Nicoll's letter:

"While I do not question the authority of the service to make the investigation or to state its conclusions. I think it would have been a little more courteous and in accordance with public health practice if the data upon which these definite conclusions were based had been presented to the State Department of Health, which up to the present time has been able to obtain no facts definitely incriminating oysters taken from Long Island waters"

What the officers of the U. S. Public Health Service seem to have found was that some persons who have typhoid fever had eaten oysters that were taken from barrels which bore the labels of a certain reliable Long Island oyster dealer. It is well known among oystermen that dishonest dealers take the empty barrels of the oystermen whose names stand for honesty and reliability and fill them with a polluted product taken from polluted waters. The honesty of dealers is one of the greatest factors in the certification of the purity of oysters.

The Conservation Commissioner of New York State and the State Department of Health are seeking a plan of action whereby the misbranding of oyster containers will be impossible. They are further seeking a practical means of marking individual oysters. It would seem to be possible to invent a machine which would print the name of a firm indelibly on an oyster, but no one has yet succeeded in doing it. A huge prize will be the reward which oystermen will gladly pay to the successful inventor of an oyster-branding device.

Pollution of oyster grounds is not the only basis for proceeding against municipalities for inadequate purification of their sewage. The *Middletown Times Press*, January 30, contains a long account of a hearing conducted by State Health Commissioner Matthias Nicoll, Jr., regarding the nuisance caused by the discharge of the city's sewage into the Monhagan Brook and thence into the Walkill River. The testimony was largely untechnical and related to odors, the destruction of fish, and the contamination of milk cows. But some technical testimony was introduced to show that the water in the brook is nine-tenths sewage and that in the Walkill River is over one-half sewage during the summer low water.

The account states that the defense of the city is that in the year 1879 the Legislature passed a law granting permission to use the brook and river for sewage purposes, and that therefore the city has the right to use them to any extent it chooses.

This defense is an illustration of the respect which Americans have for the law of the land. In spite of the fact that the law is unjust and was never intended to cover the present conditions, yet the Department of Health and the Conservation Committee will probably have great difficulty in overriding or changing the law, and in removing the evident pollution of the Walkill River.

The Mayor and the Health Officer are in

favor of constructing a proper sewage disposal plant, while the city lawyer visits on the legal rights of the city and seems to offer no constructive remedy for the pollution

The medical search for the fountain of youth has been replaced in these modern times by the quest for a universal antiseptic drug which will kill bacteria and yet be harmless to the human body. The New York *Herald-Tribune*, February 11, states that such a drug, called hexylresorcinol, has been found by the research workers of Johns Hopkins School of Hygiene and Public Health after ten years. The newspaper article says

"He first fed the antiseptic to rabbits. When the animals showed no ill effects, he swallowed some of it and was not inconvenienced. Assured of its harmlessness, he and six men who were working with him began to take daily doses of increasing size in order to study its effects in the body.

"It was then that the antiseptic was applied for the first time to the actual treatment of disease. In some cases infections of the kidneys, which had been of long standing, were cleared up in forty-eight hours, according to the records. The cures appeared to be permanent, it was said.

"A committee of fifteen has been appointed by the National Research Council to work with him in further researches to determine how broad might be the application of hexylresorcinol to disease in general. The substance is being sent to medical schools and hospitals for tests."

We wonder if the discoverer will meet the same difficulty which the Danish investigator encountered when he found that the dead and disintegrated tubercle bacteria which were killed in the body by his gold preparation, were far more toxic than the living germs. It would seem that the great value of the newly discovered antiseptic would be as preventive rather than a cure. But until we see an authoritative account of the new drug in a scientific medical journal we shall be skeptical regarding its alleged virtues.

The *Binghamton Press*, February 5, calls attention to the shortage of physicians in the State Hospitals and quotes Dr. W. C. Garvin, the Superintendent of the Binghamton State Hospital

"A shortage of physicians is reported in the various state hospitals, according to Dr. W. C. Garvin, superintendent of the Binghamton State Hospital, and he says that good men of the right training are in demand throughout the state. The great amount of shifting and changes constantly going on among the medical workers in state hospitals is shown by the fact that only

five of the local staff have been in service for two years."

Medical service in the State Hospitals, like that in the Army and Navy, requires a high quality of professional skill and administrative ability. Advancement is usually by examination which is thorough and searching. The State, like a big corporation, will probably always have difficulty in filling its higher positions.

Last week we commented on the difficulties which doctors have in reaching their patients. The *Auburn Citizen*, February 4, contains an account of physicians' experiences which remind us of the heroic dash of the dog sled drivers to carry antitoxin to plague-stricken Nome. We read

"Stories of country and city doctors making valiant fights through drifted country roads and choked highways to administer to the sick during the recent snow deluge come filtering through from the snow-bound countryside as the roads out of Auburn begin to open up before the onslaughts of snow shovel and snow plows.

"While the city doctor was confronted with unusual problems, those which the country physician had to overcome were unprecedented. Toil some journeys through the dead of night over fences and stiles, through fields on snowshoes, or battling deep drifts along the highways behind teams of exhausted horses, form the basis of a narrative that could interestingly be fictionized.

"Both city and country physicians responded whenever urgent calls were made. One country doctor characterized the spirit of his brethren when he stated 'We had difficulties, but we overcame them. We had to get to our patients, and we did. It was all in the day's work.'

"Individual experiences of both Auburn and country doctors make interesting reading and reflect the character of the city and country doctors.

"Dr. A. B. Chidester of Cato covered his territory by sleigh and snowshoe, often having to resort to both in a single call. On one occasion it took this physician three hours to travel an eighth of a mile by sleigh, and on another he was held up for three days before he could reach a patient six miles away. On one snowshoe trip he spent three hours in traveling.

"Dr. B. K. Howe of Sherwood reported similar obstacles in his attempts to get around among his patients. Snowshoes and horse-drawn cutters were used by the doctor, who also has a snow tractor which he will use just as soon as the roads open a bit.

"Dr. C. E. Goodwin of Weedsport has been able to attend to his village patients through operation of a 'snowmobile' improvised from his automobile."

## RECURRENT VOMITING IN ITS RELATIONS TO ABNORMALITIES OF THE GASTRO INTESTINAL TRACT\*

By CHARLES GILMORE KERLEY, M D  
NEW YORK CITY

**I**N different contributions during the past ten years, the writer has called attention to the possibilities of defective gastro intestinal mechanics as a factor in the disturbances of gastro intestinal function in infants and children

Recurrent or periodic vomiting has been repeatedly referred to as being dependent upon congenital or acquired abnormalities at some point in the gastro intestinal system This contribution will deal only with a few cases in which the etiology was proven to rest upon defective mechanics

The number of cases of persistent digestive disorder upon whom serial X-ray observations have been made now number 147

H J—Aged five years, male, weight 38½

FIG. 1

FIG. 2

pounds The patient developed recurrent vomiting attacks at the age of 2 years The seizures occurred from 6 to 8 weeks interval and usually lasted from 24 to 48 hours During this time there was repeated vomiting attacks There was moderate prostration during the attack and usually a moderate elevation of the temperature from 101 to 102 X-ray (fig 1) showed 4 loops in the sigmoid and one in the descending colon This portion of the intestine was fully five times its normal length The cecum showed a secondary dilatation

B D—Aged five years, male, weight 36 pounds, like the above had suffered from per-

\* Read at the Annual Meeting of the Medical Society of the State of New York at Rochester, April 23, 1924

FIG 3

sistent gastro intestinal disorders since 2 years of age. There were periodic attacks of vomiting at 4 to 8 weeks' interval, there was habitual eructations of gas, stomach pain and loss of appetite. The unusual symptoms complained of were dizziness during the seizure and pain in the rectum.

X-ray (fig 2) stomach contained food residue after 5½ hours. The lower border of the stomach was on a level with the umbilicus, the sigmoid was elongated making 3 loops. The highest point of the sigmoid at the medium line was 1½ inches above the umbilicus, it turned toward the left making another loop over the left iliac bone before it joined the descending colon.

E M—Age nine and one-half years, weight 42 pounds, there had been periodic attacks of vomiting since the child was 18 months of age. The appendix was removed when 4 years of age without improvement in the seizures. During the past 6 months there were four attacks of vomiting which were very severe and lasted from 1 to 3 days. Glucose was given intravenously in one of the attacks. This case was seen in association with Dr Allen Brown of Toronto.

X-ray (fig 3) showed a definite V shaped loop in the transverse colon, the inverted apex being about 3 inches below the umbilicus. In fig 5, the same patient, the descending colon is elongated, the sigmoid is about 3 times the average length and presents the usual looping.

W F—Male, age 5½ years, weight 28¾ pounds. There had been repeated vomiting seizures, severe and prolonged, lasting from 2 to 4 days at from 4 to 12 weeks interval for 3 years. A temperature of 2 or 3 degrees was usually present, the child showed moderate prostration and lost from 2 to 3 pounds during each attack.

X-ray showed a marked redundancy of colon and sigmoid, amounting to 4 times its

FIG 4

normal length. There were 2 loops in the descending colon and 2 in the sigmoid.

F L—Age 10 years, male, weight 107 pounds. There had been recurrent attacks of indigestion 6 to 10 weeks interval for several years, always with nausea, occasionally vomiting which was never severe. The tongue was invariably heavily coated and the breath foul at the time of the attack. The temperature rarely rose above 101.

X-ray showed an elongated pelvic colon with 3 loops together with dilatation of the rectum. Same patient, taken in the standing position shows a marked prolapse of the colon.

FIG 5

FIG 6

M M—Female, age 3 years, weight 31¼ pounds, has had convulsions every 3 or 4 months since 1 year of age. For the past 9 months there were periodic vomiting seizures accompanying the convulsions at 3 to 4 weeks interval, rarely passing the fourth week. The mother dated her social engagements to conform with the anticipated convulsions and vomiting seizures.

X-ray showed marked elongation of the colon with looping, one loop passed 3 inches above the umbilicus reaching to the top of the transverse colon. The ascending colon showed a peculiar cork screw effect due to the elongation of that portion of the gut.

T W—Age 5 years, male, weight 33 pounds. Child well until 6 months ago, since then he has had 12 vomiting seizures gradually shortening the interval, he vomits 3 or 4 times in each attack, which covers from 24 to 36 hours. The interval between the last 3 attacks was 10 days.

X-ray showed dilated mobile cecum, 2 complete loops of the sigmoid which pass to the level of the transverse colon and show definite stasis when examined with the opaque meal. The sigmoid passes 3 inches above the umbilicus and is 4 times the anatomic length.

F G—Age 22 months, female, weight 24¼ pounds, markedly undernourished, came because of repeated attacks of acute indigestion and convulsions. Convulsions and vomiting occurred simultaneously. During the attacks the temperature was always very high and the abdomen greatly distended.

X-ray (fig 5) shows dilatation of the stomach to an excessive degree, moderate elongation of the sigmoid, and the cecum was dilated.

J R—Age 5 years, female, weight 44½ pounds. For three years child has had recurrent attacks of vomiting associated with a great deal of pain. Constipation was habitual, medication required daily.

X-ray showed marked redundancy of the pelvic colon, a loop extending 2 inches above the umbilicus in the standing position. The first portion of the loop was parallel with the descending colon. The distal part of the loop passes to the right of the medium line, descends into the pelvis to join the rectum producing a figure 8 appearance. No evidence of pyloric spasm, stomach empties in 4 hours.

S B—Age 2½ years, male, weight 40 pounds. Had frequent convulsions, nine in the past year, associated with gastro intestinal disturbances. There was delayed stomach emptying, after 5 hours and 35 minutes, a portion of the bismuth meal is still present, there were 3 extra loops in the sigmoid, two pass 1½ inches above the level of the umbilicus, the third loop was in the pelvis where the pelvic colon passes to join the rectum.

L W—Age 5 years, female, weight 32 pounds. Child thin, pale and anemic. There had been repeated attacks of vomiting associated with colitis at 3 to 4 months interval since 2 years of age. The abdomen was very much distended.

X-ray (fig 6) shows an extreme dilatation of the stomach with ptosis, the greater curvature being on a level with the umbilicus. The size of the stomach is 10 inches x 4 x 4. There was an absence of peristaltic wave. At the end of 5 hours there was a large stomach retention. The colon showed extreme elongation of the sigmoid flexure which passes to a point 3½ inches above the umbilicus, it is from 3 to 4 inches the normal length.

FIG. 7

The above cases have made complete recoveries or show satisfactory improvement with the exception of case M. M., the child with convulsions and vomiting attacks in association. Prompt results were not forthcoming and the parents placed the child under the care of an endocrinologist.

Considering the etiology of our cases of recurrent vomiting and we have seen a great many such, we believe that it is the expression of a systemic intoxication from intestinal sources. Among the 147 patients with persistent digestive disorders upon whom a serial X-ray study was made there was found with few exceptions structural abnormalities of the gastro intestinal tract resulting in emptying delay either of the stomach or intestine. We have found ptosed stomachs, stomachs that showed pylorospasm, ptosed and dilated cecums, V shaped transverse colons, and elongated and sacculated sigmoids in large number. The dilated rectum in association with a spastic sphincter has been frequently encountered.

It would seem that we have failed to appreciate the possibility of systemic poisoning from intestinal sources and our results which are usually most satisfactory, and in some almost dramatic, have followed our efforts at the prevention of delayed waste material in the intestines.

Our management comprises abdominal support, a diet in which vegetables, fruits and cereals are used freely, abdominal massage and adequate elimination. Many of our cases have enlarged pendulous abdomens with relaxed muscles (fig 1). We give such children support using the

FIG 8

FIG 9

Nicholson Universal Supporter (figs. 7-8) or the Bassler Belt (fig 9).

In the long angulated sigmoids the peristalsis is always defective as shown fluoroscopically. For these we always prescribe massage and give the fluid extract of Cascara Sagrada Aromatic in sufficient dosage three times a day to produce at least two free evacuations.

Often times in patients of this sort the history shows that there is a daily evacuation but the evacuation arrives two or three days behind schedule, giving plenty of time for the absorption of toxic products.

The proof that our cases of recurrent vomiting represent a definite systemic poisoning rests in the relief supplied when the intestinal stasis is corrected. Delayed stomach emptying furthermore, is almost invariably in association with delayed emptying of the lower level.

In all cases of persistent gastro intestinal disorders in children a serial X-ray study of the gastro intestinal tracts is essential.

#### CLOSING DISCUSSION

In all our cases of recurrent vomiting we find out where the trouble is and then go ahead and correct it along the lines referred to in my paper.

The reason for the small success of many in the management of cases of this sort is that they never locate the seat of the trouble.

Some have postural defects, many do not. If you depend upon faulty posture to explain things you will miss many cases.

## ENDOCRINE THERAPY IN STERILITY\*

By TIMOTHY F. DONOVAN, M.D.,

BUFFALO, N. Y.

IN treating of endocrine therapy in sterility, I speak, not as an endocrinologist, but as a surgeon. I have learned that in the practice of surgery, a knowledge of the activities of the ductless glands is of great aid. It reduces the number of needless operations, and, in some cases of definitely surgical conditions, the organic extracts have proved to be valuable adjuncts in the treatment.

This is not a statistical report of successes and failures. It is an effort to point out certain facts that may be discovered from the history and examination of the sterile patient. These facts are important in indicating the gland or glands at fault, and in aiding in prognosis and treatment. As illustrative of these facts but a few case histories will be cited.

A knowledge of the modern conception of menstruation is important, because disturbances in rhythm of the menstrual cycle are present in almost all cases of sterility. Time will not permit of a detailed study of this cycle. A brief review of the functions of the ovary, however, will be necessary.

The ovary has two functions, the production of ova, and an internal secretory one. These two functions depend upon the presence in the ovary of the follicles, the corpus luteum, and the interstitial cells.

The follicles are (1) the primordial follicles and (2) the graafian follicles. Before puberty, the primordial follicles, having reached a certain size, become atresic. This occurs, also, after puberty, only relatively few of the primordial follicles developing into graafian follicles.

The interstitial cells develop from the atresic follicles. These cells are said to be abundant before puberty, and during pregnancy and lactation. They are an important factor in the nutrition of the uterus, and in the development of the secondary sex characters.

The graafian follicles and the corpora lutea do not begin to function until puberty.

The graafian follicle is the cause of the endometrial phenomena of the first half of the menstrual cycle. It has been thought that the stimulus for these changes comes from the maturing ovum, or from the follicles as a whole. Recently, Allen and Doisy, of St. Louis, reported that they were able to obtain, from the large graafian follicles in hog ovaries, an alcoholic extract from the liquor folliculi. This extract injected into spayed animals (rats and mice) produced the phenomena of heat. These animals acted during mating as do normal animals. And its injection

into young rats, immediately after weaning, produced maturity 20-40 days before control animals from the same litter.

The corpus luteum develops from the graafian follicle after ovulation, and it is the cause of the endometrial changes in the second half of the menstrual cycle. Its function is to inhibit ovulation, and to sensitize the endometrium so that nidation may occur. Its secretion is elaborated by the luteal cells. This secretion, according to Loeb, is present in the guinea pig only from the second or third to the 8th or 9th day after ovulation, and he has demonstrated that the quantity secreted has an important bearing on the production of the decidua.

The ovarian sequence is follicular ripening, ovulation, corpus luteum formation. So menstruation is said to be indicative of a previous ovulation. But in some cases in which menstruation occurs, as Bandler has reminded us, the ovarian capsule is so thick that rupture of the follicle is impossible.

The uterus.—We will consider (1) the endometrium, and (2) the size and shape of the uterus.

1 There are three points in regard to the endometrium.

(a) Most important is the change in the endometrium which permits the embedding of the fertilized ovum. This is the result of the sensitizing influence of the corpus luteum, and the mechanical stimulus of the fertilized ovum.

(b) The endometrium elaborates a substance which prevents the clotting of the menstrual blood. The significance of the absence of this substance is not known.

(c) Bandler warns against a too thorough curettement as a possible cause of ovarian atrophy.

2 Size and shape of the Uterus. Sterility is in most instances associated with a hypoplastic condition of the uterus. In such uteri the ratio between body and cervix is abnormal.

Novak, following Aschoff, divides the uterus into body, isthmus and cervix. And he says, "It would be of value to the gynecologist to think of the uterus as a composite organ, in the sense that it is made up of three separate segments. At various periods of life one or the other of these segments predominates in size and perhaps in function. Each segment apparently has its own function and each seems to be under the control of a different endocrine influence."

The upper limit of the isthmus is the anatomical internal os, and, the lower one, the histological

\* Read at the Annual Meeting of the Medical Society of the State of New York at Rochester April 23, 1924.

internal os Aschoff calls it the "hinge" of the uterus, because every flexion examined by him occurred at the middle of the isthmus

Novak describes three types of hypoplastic uteri—the foetal, the infantile and the subpubescent

(a) In the foetal type of uterus, the body is rudimentary, the isthmus practically undeveloped, and the cervix composes most of the organ. No differentiation is possible between the body and the cervix

(b) In the infantile type, growth is arrested in infancy or childhood, the cervix is larger than the body, but can be differentiated

(c) The subpubescent type, may be nearly normal in size, but the cervix is usually longer than the body. In a small uterus the segmental differentiation may be normal, and in a uterus of normal size the segmental differentiation may be infantile.

These subnormal uteri are associated with amenorrhea and dysmenorrhea. Amenorrhea is the predominating symptom in the foetal and infantile types, and dysmenorrhea in the subpubescent type. In the subpubescent type, the periods may be excessive, normal or scanty

These hypoplastic uteri are significant because they direct our attention to the endocrine glands. What glands are particularly concerned in the development of the genitals?

1 The ovary. Bilateral oophorectomy is followed by atrophy of the uterus, as well as of the external genitals and the breasts. Louise McIlroy has shown, by transplantation experiments, that the uterus does not atrophy until after the interstitial cells have degenerated. Another significant point in the development of the uterus is this. In a uterus removed from a girl of 14 in whom menstruation had been established, the body was almost twice the size of the uterine body in a patient 9 years old (Novak). And we have seen that the graafian follicles and the corpora lutea do not begin to function until puberty. What glands other than the ovary have a stimulating effect on the body of the uterus?

*The Pituitary*—A number of investigators (Aschner, Crowe, Cushing and Homans) have shown that after partial removal of the anterior pituitary in young animals the sexual organs remain infantile in character. In the males there are impotence and absence of spermatogenesis. The females show absence of the sexual instinct and failure of ovulation. In adult animals, hypoplastic changes and diminished sexual activity resulted. Furthermore, Goetsch caused early sexual development and over-activity of the sex glands by feeding extract of the anterior pituitary to young rats

*The Thyroid*—Leopold-Levi and Rothschild state that "Otto Lanz has shown that early thyroidectomy, in the female, prevents the appearance of the secondary sex character, of the sexual instinct, and of menstruation." And the same authorities say that atrophy of the sexual organs (Von Rostharn), a permanent atrophic state of the graafian follicles (Hazmeister), and an ovarian atrophy (Dolche) follow thyroidectomy

*The Parathyroids*—"No direct relationship has been established between the parathyroids and the female sex organs. No morphological changes in the parathyroids have been noted during pregnancy, yet apparently there is a connection between the parathyroids and the sex problems in the female." "Tetany, the clinical evidence of insufficient parathyroid function, is somewhat prone to occur in menstruating, pregnant and puerperal women, as well as patients suffering from gynecological conditions." And, "In the treatment of maternal tetany, the administration of calcium in large doses is followed by beneficial results in the great majority of cases" (Pool)

*The Pineal*—It is the opinion of Krahbe that "our knowledge of the function of the pineal gland is very defective." Its influence in the body is unknown. The association of precocious puberty with tumors of the pineal gland does not prove that the gland normally acts on the sexual glands. The tumors are almost invariably teratomas

*The Thymus*—Hammar states that "The old theory of the age involution has thus undergone revision to the effect that the involution does not appear until puberty and that it certainly causes a gradual reduction of the parenchyma, but in such a way, however, that a functioning parenchyma remains as a rule, even in old age. Under such circumstances there can no longer, of course, be any question of a 'existence of the thymus in the usual meaning of that term.'" Pappenheimer thinks that the evidence as to the influence of the thymus on the gonads is contradictory

*Adrenals*—Hyperplasia of the adrenal cortex is frequently found with pseudo hermaphroditism. "Adrenal hypernephromata are almost invariably characterized in children by precocious growth of the body generally and of the sexual organs in particular, with overgrowth of hair and fat." They are "much commoner in females than in males, and tend to increase the male primary and secondary sexual characters at the expense of the female" (Swale Vincent)

Atrophy of the gonads is found in Addison's disease

It is evident then, that the organs which merit our particular attention are the ovary, the thyroid and the pituitary. Sterility is frequently associated with under-functioning of one or more of

these organs, and only the characteristic signs and symptoms of such under-functioning will be considered

*The Ovary*—A frequent cause of under-function of the ovary is Acute Interstitial Oophoritis. This may result from (a) local infection (gonorrhea or puerperal sepsis), (b) from acute infectious diseases (typhoid, mumps, scarlatina, measles, chicken-pox and diphtheria), (c) haematogenous infections (tonsils and teeth). The ovary becomes swollen and oedematous and shows the gross histological signs of acute inflammation. It may show small multiple abscesses or a single large one.

Davis reports the results of cultures, from 65 ovaries, made by Rosenow and Davis. There were three acute cases. Of these two showed the streptococcus viridans, and the third, the gonococcus. The other 62 were the seat of fibrous and cystic degeneration. Ten showed negative cultures. Of the remaining 52, 30 showed streptococcus viridans, 8 being pure culture. In the other twenty-two, streptococcus was mixed with other organisms. Most of these patients had no history indicating a pelvic inflammation.

The more common end-results are (a) Subsidence of inflammation without any recognizable or histological lesions. (b) A mild or severe degree of destruction. (c) Sclerosis of the ovary.

With pelvic peritonitis there is seen an acute peri-oophoritis. The capsule may act as a barrier to bacterial invasion of the organ proper. Later, in some cases, the capsule is so thickened that ovulation is prevented and cystic disease of the ovary develops. The organ may be involved in adhesions, which interfere with the blood supply, resulting in destruction of the ovary.

Goodall states that hemorrhage is not at all uncommon, the most frequent cause being acute fevers. The hemorrhage may be into the corpus luteum, or there may be an extravasation with destruction of ova.

If primary ovarian underfunction occurs before puberty the chief symptoms are late puberty, amenorrhea, or scanty, irregular flow, hypoplasia of uterus and appendages, and absence of secondary sex characters. These patients are apt to be of the eunuchoid type tall, slender, extremities disproportionately long as compared to the trunk, with a long, slender hand.

If the under-functioning appears in adult life, hot flashes, changes in disposition, insomnia, digestive disturbances, a tendency to obesity are the commonest symptoms. Quite frequently if the condition has existed for some time, atrophy and sclerosis of the uterus are found.

A brief history of three cases will be given to indicate different types of cases to be met with.

Case I Mrs G. First seen December 22, 1912, in acute alcoholic delirium. She was 32 yrs of age, 5 feet 6 inches tall and weighed 111 lbs. After her recovery it was learned that she had always been sickly and anemic as a girl. Her periods began at 17, were always regular, scanty and of 2 days duration. She had been married 14 yrs and had never been pregnant. Various physicians had been consulted about her condition, and finally, in 1905, she was examined by a noted gynecologist, who said that he did not think she would become pregnant as she had an infantile uterus. In discouragement she acquired the alcohol habit. In February, 1913, corpus luteum Gr V t.i.d was prescribed. Within a few days she returned to her home, and was not seen again until February, 1914. In the meantime, she had taken the corpus luteum continuously, and she weighed 150 lbs and was 5 months pregnant. She was delivered on May 20, 1914, of a normal baby girl. She was last seen in April, 1924. She had not taken corpora lutea since the birth of her child, and had never again become pregnant.

Case II Mrs C, when first seen on September 16, 1920, was 21 years old, had been married for 3 years and had never been pregnant. She had all the diseases of childhood, none of them severely, and frequent attacks of sore-throat. Her periods began at the age of 14 yrs, always regular up to three months ago, since then they have been from 3-7 days late, she flowed from 3-6 days, and for the past year always passed many small clots. Her periods were preceded and accompanied by severe abdominal pain. There was no history of pelvic inflammation, but she had an adherent, infantile retroverted uterus. Operation was advised. On October 4, 1920, she was operated upon. Adhesions between uterus and ovaries broken up, a Baldy operation was done, and both ovaries, which were of the small cystic type, were resected leaving, of each ovary, a piece the size of a pea. Her uterus was infantile and hard. She showed improvement after the operation until February, 1921, when she showed moderate enlargement of the thyroid, and complained of constipation and that her hair had been falling out. She was given thyroid nucleo-proteid tablets (5%) t.i.d. On June 3rd, she was feeling much better, her constipation was relieved, her hair had stopped falling out, and a note made at the time says that "The uterus seems larger; stump of right ovary larger and tender, that of the left not felt." Her thyroid enlarged during her periods, and thyroid medication was stopped and ovarian nucleo-proteid (10%) t.i.d prescribed, to be taken two weeks in every month. Under this treatment the menstrual enlargement of her thyroid did not appear, her periods came "at four o'clock every fourth Tuesday," lasted for 3 days. She had no pains or clots. On December

6, 1921, she said that morning vomiting had been present for a month, her last period having started on October 12, 1921, and she showed all the presumptive signs of pregnancy. She was delivered of a normal baby at term by Dr. Victor Pchellas.

Case III Mrs. N. Age 31 yrs. Seen April 16, 1924. Married 8 yrs.

#### Complaints—Dysmenorrhea and Sterility

**Menstrual**—Began at age of 13 years, regular every 28 days, scant flow for 2 days, no clots, general abdominal pain begins one day pre-menstrual, and is very severe on the second day. She had been dilated and curetted 2 months before with no relief. She had Typhoid Fever at the age of 6 yrs., Measles and Chicken-pox. At the age of 18 yrs. had a severe attack of Mumps. She doesn't remember whether she had any abdominal or pelvic pain following the Mumps. Frequent attacks of tonsilitis. Examination shows a moderate enlargement of the thyroid, more marked in the left lobe. This has been present as long as she can remember. Pelvic examination shows an acutely retroflexed, adherent, subpubescent uterus. Ovarian nucleoprotein (10%) tablets t.i.d. were prescribed, and abdominal exploration advised. I believe that neither alone will relieve her. It remains to be seen if both combined will do so.

**The Thyroid**—You are all familiar with the complete forms of thyroid insufficiency—cretinism and myxoedema. But the frequency of the incomplete forms (called "hypothyroidism," "chronic mild hypothyroidism," "masked hypothyroidism") is not recognized.

Retardation or cessation of growth may be the only sign. The delay in growth is "brought about by the late appearances of the bone nuclei and extremely slow ossification of centers already laid down. The epiphyses may be absent many years after they are due to appear and their closure with the shafts of long bones be indefinitely delayed. It has been demonstrated that this phenomena is one of the earliest and most common in hypothyroidism" (Janney).

Usually these patients sweat only after great effort. They usually tire easily and their fatigue is more marked in the morning. The color is pale or sallow, the hair dry and apt to fall out, there may be scantiness of the eyebrows, with absence of the outer third. Quite frequently there is a saddle nose. The hands may be spade-like and show brittle or ridged finger nails, with white spots under the matrix.

Obesity, or a tendency to it, is mentioned in all texts as a common finding. This obesity is characterized by its general distribution, and the formation of supra- and infra-clavicular fat pads. I have seen a number of cases of amenorrhea following influenza, in which the menstrual disorder and the general condition (fatigue, anorexia, and

constipation) cleared up on thyroid medication. When first seen they were underweight, after treatment they all showed a gain in weight. One of these cases was particularly interesting. She was married, had two children, and two years before had a severe attack of influenza, from which she dated the onset of her symptoms. A round ligament shortening had been done for a retroverted uterus, which was expected to relieve her complaints. From a technical viewpoint the result of the operation was perfect, but symptomatically she was worse. Then because of a loss in weight of 22 lbs. tuberculosis was suspected. When I saw her in February, 1921, she was 25 lbs. underweight, and complained of fatigue, anorexia, constipation and scanty irregular periods. On thyroid, to which ovarian extract was subsequently added, her symptoms gradually disappeared, and in six months she had gained 40 lbs.

The gastro-intestinal tract is commonly affected. Children have poor appetites, and adults "eat more from reason than from appetite." There is commonly intestinal atony and insufficient intestinal secretions. This is doubtless due to the degenerative changes seen in the vagal nuclei. Constipation which is frequent may be associated with mucous colitis.

The history is important. It may show the presence of familial thyroid disturbance (for example goitre, or hyperthyroidism) or the occurrence of an infection. (The infections, according to Sajous, which are most frequently followed by hypothyroidism are influenza and syphilis.) It may also show that there was delay in walking, talking or teething. Delayed dentition with decay early in adult life are frequent symptoms.

Leopold-Levi and Rothschild describe two types of menstrual disturbances associated with this condition. In the first group is included scanty, late or suppressed menstruation, and, in the second group, the periods may be early, of prolonged duration, and profuse. Thyroid medication has in the first group a stimulating, and in the second, a regulating effect. Then there is Hertoghe's syndrome of thyroid insufficiency characterized by (a) late puberty, (b) scanty periods, and (c) early senility.

Examination in any of these groups, "show an infantile or pubescent uterus, and anterior, posterior or lateral mal-positions."

Sajous says that the thyroid gland in hyperthyroidism passes through 3 stages: (1) stage of overfunction, when thyroid medication will do harm; (2) transitional stage, when symptoms are mixed, and in which thyroid in small doses may help; and (3) the stage of underfunction, when more or less of the gland has become fibrous, and in which thyroid medication is indicated.

The practical importance of this is that an individual in the stage of underfunction may

show some degree of exophthalmos, and this, with the goitre, may lead us to believe that thyroid medication is not indicated

*The Pituitary*—In our study of the pituitary the classification of Engelbach and Tierney will be used

The pituitary gland is made up of two parts, the anterior and posterior lobes. The posterior lobe consists of the pars intermedia and the pars nervosa

Conditions of hyperfunction and of hypofunction may be classified as to the time of their inception into pre-adolescent and post-adolescent (the normal period of adolescence is from the tenth to the fifteenth years), and, as to the presence or absence of a tumor, into neoplastic and aneoplastic

"The anterior lobe controls and regulates (a) the skeletal growth, (b) the function and development of the genital organs and the secondary sex characters. The posterior lobe is definitely concerned with (a) the regulation of carbohydrate metabolism—glycosuria, hyperglucemia, sugar tolerance and obesity, (b) the contraction of involuntary and unstriated (muscle-peristalsis and uterine contraction), (c) the renal secretions—polyuria, (d) the blood-pressure and (e) the body temperature"

Each lobe may show evidence of under- and over-activity, singly or together, or one lobe may be under-active and the other over-active. We are concerned chiefly with the manifestations of under-function of the anterior lobe, whether this under-function is complete or incomplete

"The best indicators of the state of functional activity of the anterior lobe are muscle tonus and genital function" If this lobe is under-functioning there are fatigue, disturbances of menstruation, frigidity and sterility

In the complete form of the preadolescent type there is skeletal undergrowth, absence of the secondary sex characters, "small head, small sinuses and small sella", type "en petit" hand, which is one-third smaller than normal (the fingers being short), nails small, absence of white crescents at bases, infantile uterus, tubes and ovaries, under development of the external genitals. The teeth erupt at the normal time but are deficient in enamel and apt to decay early. The lower teeth are very often crowded, while the upper ones show fair occlusion

In the incomplete form of pre- or post-adolescent type, there is under-growth of the short and flat bones only, the patients are of normal height or tall, the external genitals are more or less incompletely developed, the uterus and ovaries are apparently normal in size, but, histologically, the ovary shows a small number of graafian follicles, and undergrowth of the stroma, late puberty

(15-17 yrs) frequently amenorrhea, dysmenorrhea and metrorrhagia-dysmenorrhea, sterility and frigidity are almost always present. Fatigue-ability is invariably present. Some of these patients instead of showing the "small hand" have a type in which the fingers are long in comparison with the palm

Engelbach and Tierney give three types of menstrual disturbances as a result of insufficiency of the anterior lobe (a) amenorrhea due to pre-adolescent complete inactivity, (b) metrorrhagia, early, post-adolescent, incomplete form; and (c) dysmenorrhea late post-adolescent partial inactivity

Early cases of anterior lobe deficiency are not apt to show other gland dyscrasias, but later on there may follow an under-function of the posterior lobe, of the thyroid and of the gonads. Underfunctioning of the posterior lobe manifests itself by "migraneous headaches, dyspnoea, syncope attacks, severe gastro-intestinal attacks, incapacitating abdominal and lumbar pains, polyuria, polydipsia, girdle type of obesity etc" The abdominal pains are frequently associated with attacks of mucous colitis

Still later the signs of pituitary tumor may be seen—headaches, ocular disturbances, signs of intra-cranial pressure, etc. Only 6 per cent in over 200 cases showed tumors (Engelbach and Tierney)

Hyperpituitarism also, may be of pre- or post-adolescent development. To help distinguish these types, certain measurements are taken—the span, the torso and the lower. The span is obtained by measuring the laterally extended arms between the tips of the middle fingers—the torso, from the top of the head to the symphysis, and the lower, from the symphysis to the soles of the feet

*Hyperpituitarism*—(1) The preadolescent type is gigantism. These individuals are abnormally tall, have well developed uteri, ovaries and external genitals, normal periods, hand is the "en longe" type, one-third larger than normal, secondary sex characters present, upper incisors enlarged and separated, normal or over-developed muscle tone. Libido and fecundity are present

There are 3 kinds of gigantism. Normal in which span equals height and torso equals lower. Eunuchoid in which span is greater than height and torso less than lower. Acromegalic in which span is less than height and torso greater than lower

(2) Post-adolescent type is known as acromegaly. This form shows overgrowth of acral, short and flat bones. Patients are short and stocky, or normal in height. The hand "en large" (spade hand) in which the wrist is large and the

fingers clubbed Uterus, ovaries, external genitals well-developed Separation of upper and lower teeth A prognathous jaw is usually seen Libido and fecundity are present Muscle tonus over-developed, span less than height, torso greater than lower

The important thing to remember about these is that showing as they do all the skeletal signs of over-activity they may really be suffering from under-activity at the time of observation

The change from the stage of over-activity to under-activity is made apparent by the presence of a depressed and apathetic state of mind associated with lack of sexual desire, sterility and fatigueability

In the preadolescent type these changes usually come on in a few years, and in the post-adolescent variety they may not appear for a number of years

Case IV Mrs K. Referred by Dr Getman on March, 1924 She is married, age 33 yrs, and complains of fatigue and sterility Had measles, mumps and chicken-pox before puberty For four years had frequent attacks of sore throat Menstrual began at age of 17 years At first she flowed only every three or four months, scant for six days, since marriage, every 28 days and she has a scant flow for two days Severe supra-orbital headache, one week before her period, she is free from it during the flow, and it is present for a few days after the period is over She feels tired most of the time For eight months she was on a mixed gland preparation, then for a similar length of time on ovarian residue (P D & Co) Examination shows a woman 5 feet 2¼ inches, with shoes (and 5 foot 1 inch without shoes), tall, weighing 111¼ lbs, the "small" type of hand, concerning which she says there is always difficulty in getting gloves to fit her, the glove fingers being too long Her uterus is one of the subpubescent type, is acutely anti-flexed and has a small subperitoneal fibroid above the internal os, her ovaries are easily palpated and seem normal in size and consistency Her cervical secretion is slightly acid A skull picture shows a small sella, the anterior and posterior clinoids meeting A picture of her hands shows tufting of the terminal phalange The tufting is looked upon as an indication of over-function of the anterior pituitary It would be interesting to know if this tufting was present before Dr Getman began treatment, or if it is the result of treatment Because of her short stature, small, closed-in sella and "small hands," a diagnosis of anterior pituitary, with secondary ovarian, insufficiency was made Ovarian Residue (Schiefflin) MXV was prescribed t i d. On March 27th, after one week of medication, her pulse was 88, and her blood-pressure 128/80 At her first examination the pulse was 72, and the blood-pressure

116/70 The dose was cut to MX April 11th, three days after her period stopped, she was seen again She had no pre- or post-menstrual headache, she felt less tired, and had flowed for four days, the bleeding being more normal in color and amount She will be kept on this ovarian preparation until improvement stops, when an anterior pituitary will be given Later, if necessary, both will be given

This appears to be a favorable case for two reasons (1) the prompt response to medication, (2) the subpubescent uterus, which has the best prognosis of the hypoplastic types

*Prognosis and Treatment*—Rongy, in 1922, reported the results in 400 cases seen in private practice Among the number operated upon he stated that in nearly 75 per cent of cases who had from one to six operations for the cure of sterility, the sterility remained He was very much discouraged by his results from glandular therapy as well And he concludes that the final solution of the cause of sterility will be the work of the chemist and the biologist Falta expresses the same thought when he says, "the deficient knowledge of the chemical nature of the active substances given off by the ductless glands constitutes the weak point in the knowledge of the internal secretions and explains why even today we are often compelled to work with hazy ideas"

All who have used glandular extracts in the treatment of sterility know that these extracts are far from infallible as a cure

As Novak pointed out in speaking of ovarian therapy, "there are a number of perfectly rational indications for the employment of ovarian therapy in which the actual clinical results are of no special value" He thinks that the degreasing process used by most manufacturers, the methods of collection of the organs at the abattoir and the means of checking them at the pharmaceutical house, as well as the question of dosage are important factors in determining our results He, too, looks to the chemist to help us out of our dilemma

Lisser calls attention to the fact that the strength of different extracts of the anterior pituitary vary in potency "The dosage of different firms is not always equivalent—for example, one grain of Burroughs and Wellcome's organic extracts does not correspond with one grain of Armour's and of Parke and Davis"

For years John Rogers of New York has been telling the profession that the ordinary thyroid of the market was apt to be inert or toxic In 1915, I saw an illustration of the value of that observation A woman 25 years of age showed, what I thought, were typical symptoms of chronic hypothyroidism She was given ½ gr thyroid extract, t i d and within 10 days she showed toxic

symptoms After she had recovered from these she was given another thyroid preparation After which there was a gratifying amelioration of her old complaints

So it is apparent that the biologic chemist has much to do In the meantime, however, can the clinician contribute to the solving of this problem? And the clinician may be heartened in his labors by the words of Sir James Mackenzie, when he says "By a strange confusion of thought 'scientific' work, in medicine, is often used as synonymous with laboratory work Scientific work is any work done with accuracy and discipline of mind, and this should be as commonly maintained by those who see the sick in their homes or in the wards, of hospitals, as by those whose work lies in laboratories"

Blair Bell in his paper on "Intrinsic Dysmenorrhea" says that the average age of patients when they consulted him with that complaint was 33 years This means that the patients had undoubtedly consulted one or more doctors before going to him, as he is a gynecologist

He considers that "Intrinsic Dysmenorrhea" is most commonly seen with a type of subpubescent uterus, which he calls "the cochleate uterus" And we have learned that dysmenorrhea, and other menstrual abnormalities, and sterility, are frequent with the different types of hypoplastic uteri

Either we do not see our patients early enough, or, seeing them, fail to recognize the endocrine basis of their symptoms

If we see a patient who has begun to menstruate at the age of 14, but whose periods are irregular, scanty or profuse, or one whose periods did not appear until she was 16 or 17 years old, and since that time have shown disturbances of rhythm of the menstrual cycle, and if associated with these signs we find one of the types of hypoplastic uteri, examination of the patient with attention to the presence of the stigmata of endocrine disturbance is indicated (The more nearly normal the uterus, the better the prognosis The subpubescent type is the most, and the foetal the least, favorable type. Cases No I and II show that the infantile type is not necessarily hopeless)

Particular attention should be paid to the history of the occurrence of infectious disease We are apt to ignore the significance of scanty or absent menses following an infection like influenza, and thus lose valuable time If the patient has had a number of infectious diseases, or a severe attack of one of them, ovarian extract is indicated either alone or in combination with extract of the thyroid In administering ovarian extracts, as a general rule, first try corpus luteum, if no improvement is shown then administer extract of the whole gland

If the patient's history shows a late dentition, with a tendency to alopecia, gastro-intestinal symptoms, usually in the form of anorexia and constipation, thyroid is probably indicated The diagnosis can be confirmed by X-ray By means of the X-ray we can determine if the patient has the centers of ossification, present and complete, which are normal for her age Much valuable information on this point can be obtained from a recent paper by Engelbach and McMahon In their article they give two very useful charts one indicating the bone nuclei that should be present at a given age, and the other, parts to be X-rayed to obtain the required information When thyroid is indicated start with  $\frac{1}{2}$  grain doses three times a day, or thyroid nucleoprotein, in the strength of 2 per cent, 5 per cent or 10 per cent, may be given with equal frequency If the patient is obese, thyroxin is usually given, a daily dose of 16 mg has been shown by Kendall to be sufficient to keep the basal metabolism at a normal level

If, on the other hand, the patient is short of stature, with a small well-proportioned head, with the "small" type of hand, and small feet, and complaining of fatigueability, the anterior pituitary is at fault (Engelbach and Tierney think the children in pituitary families should be examined regularly as to height, growth of bones, etc, so that "prophylactic" treatment may be begun early) If those cases in which the anterior lobe of the pituitary is at fault, use extract of the anterior lobe, either by mouth, intramuscularly, or by both methods, it is given by mouth gr V t i d and intra-muscularly 1 c c at from one to four days interval Where extract of the posterior lobe is needed, give M V hypodermatically, increasing the dose by M V daily, until the given dose produces, within 15 to 20 minutes, abdominal cramps followed by a bowel evacuation Then this dose is to be continued, at daily or weekly intervals, depending upon the severity of the case

It is my belief that if we recognize these conditions early enough, we can by exhibiting the indicated extracts, more successfully restore the disturbed endocrine balance

And in the use of these remedies it is well to bear in mind what was said in an editorial in "Endocrinology" This editorial was called "Patience in organo-therapy", and the writer says in part "The unfortunately too common practice of prescribing a two-weeks' supply of gland capsules or tablets, and expecting positive achievements within such a very brief period, is quite absurd It is beside the point that the adrenal, ovarian, pituitary and testicular products at present available are far from perfect in standardization or potency Nothing can be expected from their haphazard administration, usually in

inadequate dosage over a few weeks time Not even thyroid extract will prove efficacious under such conditions

"Patience in organo-therapy is absolutely essential Many months of careful trial are necessary before failure must be admitted, and if beneficial results have been obtained, therapy must long be continued "Gland therapy should only be attempted where there is definite indication, and then its application should be continued with patient persistence until a fair judgment can be rendered after a fair trial"

## THE TREATMENT IN AUTOMOBILE ACCIDENTS \*

By JOHN J MOORHEAD, M D, F A C S,

NEW YORK CITY

**A** TITLE of this sort might with equal appeal interest a repairman of the human machine or a repairman of the latest 1925 model, irrespective of the location or the size of the "service station" maintained

The influence of the automobile in our professional life is not yet fully realized even by those of us who are closely in touch with the accident problem introduced by the widespread use of motor driven vehicles. We all appreciate the effect of the automobile as related to the out-of-doors existence now made possible to countless numbers hitherto dependent upon the trolley or the railway. We all realize the change it has made in our ability to make distant calls on patients, and realize also how patients at a distance have access to us in our office or at our hospital. Few physicians recognize, however, that this accessibility may act to our detriment as well, in that a swift journey in an automobile may take our patient to a distant confrere or a distant hospital instead of bringing that patient into our own care or into our own hospital.

A new responsibility has in reality been brought into our practice by this universal form of transportation, just as years ago a new responsibility was created by the advent of the railway and the advent of large industrial plants. Until a few years ago some of you may recall the infrequency of accident work among physicians who were located at a distance from railway or industrial centers. Then the ordinary accidents were those incident to horse drawn vehicles to accidents on the farm, to accidents of ordinary haphazard, to accidents of sport or

recreation. These were relatively few by comparison with the rapid increase incident to railway and trolley travel, to the increase that followed rapid industrial development.

Still earlier, traumatic surgery in the mass dated back to Civil War days, and in effect we can say that now we are repeating a cycle that began in the '60's, for we are once more in a post-war period characterized by great activity in transportation and industry.

Some of our preceptors and professors gained much of their proficiency in the treatment of the injured by an experience gained in the Civil War and the mechanical age that followed thereafter.

History is repeating itself and today we have reached a period where traumatic surgery is based on the experience of the World War and the very rapid development of motor transportation and industry. Railways, mining and industry were formerly the three occupations providing the greatest incidence of injury. Today the greatest single factor is easily the automobile, industry the second, railways the third, sports the fourth. Government statistics for 1923 indicate that 83 per cent of highway fatalities are due to motor vehicles.

It therefore behooves the medical man of 1925 model to bestir himself in an effort to make his surgical procedures the last word in human conservation.

Despite the increase in the number and variety of these traumaphies, there is, however, no basic or fundamental change in surgical principles growing out of our war or post-war experiences, but there are numerous important changes in technique that lead to a greater saving of life and of limbs.

\* From the Department of Traumatic Surgery, New York Post Graduate Medical School and Hospital.  
Read before the Post Graduate Medical Society, October 9, 1924.

the patient with a damaged hand or a functioning hand? What value do we place on our own hand? Next to our eyes, there is nothing more important. Treat all wounds of the hand with the greatest respect and apprehensions, especially small wounds that bleed little or not at all—punctures of the finger tips especially. Adequately sterilize after the manner already suggested. In the majority of hand wounds, do not tie the sutures at all until the second or third day, merely inserting the sutures at the first dressing. This is the so-called method of "delayed suture" or "primo-secondary suture" as opposed to "immediate suture" or "primary suture." As time goes on, our practice in most wounds of any region is to adequately sterilize, then to place but not to tie all the sutures, awaiting the lapse of 48 to 72 hours to determine the presence or absence of infection. This principle of wound treatment is exceedingly important in view of the statement previously made that infection due to the causative agency manifests itself in the first three days unless re-infection or secondary infection occurs from contamination due to our own faulty technic. Nothing really is lost by this plan of "delayed suture", on the contrary, many infections are thus prevented. Incidentally, we should not fail to enforce this rule on our ambulance surgeons and the internes in our accident ward.

Many of these hand wounds are associated with fractures, and numbers of them are badly mangled. In these, it is needful to spend a long time in the preliminary cleansing with soap and water, using a grease solvent like benzine, gasoline or kerosene when needed.

We save every bit of attached soft tissue at first, for the hand, like the face, is rich in blood supply and our early conservation may be rewarded by a restoration of function seemingly impossible. Keep the fingers straight. Separate them by a layer of gauze soaked in sterile vaseline or olive oil. Hold them straight by passing a needle and thread through the finger nail, fastening the thread over the end of a splint. A piece of telegraph wire makes an excellent splint when the shaped ends are bound together by adhesive or electrician's tape, and the entire finished splint is then covered by gauze. We must not forget to use Tetanus Antitoxin in any crushing hand wound that may have become soiled by street dirt, garden soil or by contact with any manured location. This applies also to any other anatomical location, especially if a fracture co-exists. We do not fear to use Tetanus Antitoxin because of a possible anaphylaxis. If we inject the antitoxin slowly this reaction will usually not occur, if still we fear it, we have at hand a hypodermic of adrenalin 1/10,000 to ward off the onset of anaphylactic evidences. If there is any one indisputable surgical lesson growing out of our recent war experience it is the demonstration of Tetanus Antitoxin as a sovereign remedy,

practically a specific, in the class with quinine for malaria, mercury for syphilis and insulin for diabetes.

### INFECTED WOUNDS

If the infection appears in a case originally under our care, we immediately open the wound to allow free drainage. We have learned the value of making a smear or culture of the wound and thus early determining whether or not we are dealing with a streptococcus invasion. We fear this organism with a real terror, and once we determine that it is present, we make sure of unusually free drainage very promptly. We do not so much fear staphylococcus infection, or colon infection, and almost with a certainty we can laugh at a pyocyanus or "green bug" infection for this blue or green pus is for us the "laudable pus" of our predecessors—indeed we might call it "laughable pus" because of the joy it seems to produce in the subsequent repair. Some day we will deliberately inoculate our streptococcal or strepto-staphylococcal wounds with pyocyanus and watch the latter battle for our side.

Gas bacillus infection is fortunately rare and in many of these, liberal drainage will prevent amputation. Beware of it when muscle has been much crushed, vessels are injured or a tourniquet has been used.

In already established infections, in those untreated or lightly or improperly treated, we should be guided by the type of the organism and the clinical signs before ruthlessly proceeding with incisions and drainage. Never incise for redness or swelling alone. Incise only for fluctuation, for sharply localized pain, from definite induration. Incise in the direction of the main underlying structures. Rarely cross cut. Make the incision sufficiently long and deep so that the wound edges actually gape apart. Beware the so-called "medical incision" which is generally about half an inch long and an eighth of an inch deep. Get in the habit of declining to incise unless you can use a local anaesthetic or better nitrous oxide, ether or ethyl chloride by the drop method. Never use chloroform in any traumatic case, for it is as dangerous in this class as it is safe in obstetrics, remembering that even in the hands of a trained anaesthetist chloroform is still the most lethal form of narcosis. When draining an infected wound, use rubber bands or rubber tubes unless the bleeding requires gauze. If so, soak the gauze in vaseline, olive oil or sterile soap suds so that it will not adhere. Dress such a wound in the early stages with a hot iodine solution on many layers of gauze. Keep it wet by placing perforated rubber tubes in the gauze, so that these tubes can take up solution injected every three hours if necessary. Splint and elevate an infected wound. Soak off the dressings in running water.

We would revert to some of these in essential detail, having in mind some of the usual or common forms of trauma as witnessed in automobile accidents

### WOUNDS

We now know that antiseptics have only a limited value, however vaunted any one of them may be. As a matter of fact, the washing away, the liquifaction power, the mechanical stimulation, is for any antiseptic an essential element. The germ killing power of an antiseptic is in reality only secondary, inasmuch as the demise of the germ is usually associated with the demise of adjacent normal tissue and thus is of doubtful value. We now know that in any ordinary wound, germ life does not appear until about eight hours after the injury, that at 12 hours thereafter the organisms may be fairly numerous, and that at 24 hours thereafter, they may be almost uncountable. At the end of 36 hours, some of the original colonies die, but new colonies appear often enough to give in some instances that characteristic daily rise of temperature so common in septic cases. We must stand on the fundamental principle that germs live in wounds only when there exists damaged tissue enough to nourish them. Hence the axiom that early sterilization is the key to success, for a clean wound means early healing, a dirty wound means delayed healing. Early or immediate sterilization is possible by two methods only. One is *mechanical sterilization* obtained by sparingly cutting away the bruised, lacerated or otherwise damaged tissue so that only healthy red tissue remains. This is the principle of debridement first used by the French and later universally employed by Allies and foes alike. Strangely enough this very process dates back to the Napoleonic wars, when it was advocated by Napoleon's famous surgeon, Baron Larrey. It is applicable, of course, only to the severer wounds of civil life, practically only to hospital cases or those in which an anæsthetic is necessary.

The second method of wound sterilization is *chemical sterilization* and this is the procedure applicable to the ordinary case. Here we endeavor to wash away all contamination by soap and water, using benzine, gasoline or kerosene to remove grease or tar. Then we flood the wound with an antiseptic of known staining quality, seeking as it were to "fix" the tissues, using the term we remember from our student experience in the histopathological laboratory. What is a good "fixing" agent of reliability for every day use? Not carbolic or bichloride surely. Not a chlorine or other nascent agency. Based on our experience the official alcoholic tincture of iodine is the antiseptic of proven worth. Wisdom dictates the use of one antiseptic only after

we have verified the value of it. If we use seven, that means that we vary our technic by the days of the week more than by the lessons of experience. It is unwise to use an antiseptic because it has advertising propaganda and an attractive label or a pretty name, we use it, because yesterday, today and tomorrow it does what any standard form of therapy does—namely, acts. So then this accidental wound is cleaned by soap and water, it is dried, it has iodine freely poured into it. If it is a punctured wound, we inject the iodine with a syringe or hypodermic.

*Next suturing.* Apply sutures loosely. In some cases, as indicated below, we do not suture at once. Always use interrupted sutures of non-absorbable material. In children and in some adults, a few long attached hairs twined or tied across the scalp wound act as well as sutures. In some cases, adhesive strapping is also efficient.

*Next draining.* Every wound not made with surgical intent is already infected and should be drained. We use for this purpose rubber bands, a rubber tube, or where the wound is small, we insert a strand of our suture material, using a needle to place it. This drain is removed in 24 to 48 hours if all goes well. The only reason for not using a drain is the groundless fear that union is compromised. The contrary is true as a matter of clinical experience, for an adequate rubber drain will not in the least interfere with wound coaptation if it is removed by the end of the second day. We do not use gauze for drainage unless we deliberately plan to use that material as a hemostatic agent, or design to keep wound edges apart. Gauze when saturated by blood or serum acts as a plug or cork and obviously then ceases to function as a vent.

*Next the dressing.* Gauze should always be placed next to the wound, not absorbent cotton or rubber dam. The first few layers of gauze may well be moistened by a mild antiseptic to render sterile the field adjacent to the wound, especially the area about a contused wound. Our experience again favors iodine for a wet dressing, using one dram of the tincture to a pint of normal saline solution. For many years this "iodine solution" has been the vehicle of choice in our practice when a non-irritating antiseptic is demanded for irrigations or wet dressings. In many cases it is wise to splint the wound for the first few days, and this is notably true in hand and forearm wounds. Splint thumb up in hand cases and palm up in forearm cases. Anticipate a tendency to flexion in any wound contiguous to a joint, and splint accordingly.

### HAND INJURIES

There is more mutilating surgery in this group than in any other, especially when infection has begun. We must never forget that our initial treatment may be the essential factor in providing

sary when the fracture line is non-serrated, as in many smooth transverse or smooth oblique fractures. Very rarely attempt to reduce any fracture without anaesthesia unless it is seen within the first few hours. Swelling and muscle spasm will defeat our best efforts after this lapse, to say nothing of the added pain induced by manipulation. Again beware of chloroform, using instead, nitrous oxide, or ether or ethyl chloride given drop by drop.

We should more often attempt the reduction of fractures of long bones by gradual weight traction rather than by quick manual traction. By this we mean to apply adhesive straps or glued straps to a limb, then fastening a weight to these straps so that thus the muscles may be pulled into line, for in reality we set every fracture not at all by setting the bone but by setting the muscles.

A very serviceable non-irritating glue called Lotol is to be marketed by the U S Rubber Company, using their liquid rubber Latex as a base. This has been tried out in my service and I can recommend it as a fixative for traction straps made of adhesive plaster, moleskin or muslin.

A towel or sheet around the ankle or wrist will act as an efficient traction strap until we can apply a more elaborate apparatus composed of a pulley, an overhead set of bars (Balkan frame), or special splints of the Thomas or similar varieties.

If we apply this form of preliminary traction at once, placing the limb in a grooved pillow, we will be gratified to find reduction much easier, perhaps even attained, when we next see the patient after a lapse of eight or more hours.

This applies with great detail to fractures of the lower extremity, and to the dreaded fracture of the neck of the femur in old people. In many of these fractures of the neck of the femur, any fixed apparatus immobilizes the patient as well as the hip and leads to stasis of circulation ending in pneumonia or cardio-renal disaster.

There is no question as to the value of the plaster of Paris spica in selected cases of fracture of the neck of the femur, but we must remember that a fat, flabby abdomen or a retracted cadaverous abdomen in an old person lessens the holding power of the abdominal part of the cast and is likely to press the abdominal contents against the diaphragm to such an extent as to impede thoracic breathing and thus to promote hypostasis, which last is also aided by the enforced recumbency induced by the cast, despite frequent turning of the patient.

As a matter of practice, we never use a circular plaster of Paris casing or cast in any recent case (neck of femur excepted), but do place great reliance and faith in two piece

moulded plaster of Paris splints. Whatever is used, every splint should be first of all safe and next it should be simple and next economic.

There are certain selected fractures demanding open or operative reduction from the outset, conditions permitting. In this group are displaced fractures of the patella, of the olecranon, of the forearm, some of the tibia and some of the os calcis.

Plating, wiring and the introduction of non-absorbable material is needlessly dangerous surgery in the vast majority of cases and it should not be attempted by the occasional operator who, strangely enough, is just the surgeon who is now doing most of it.

Fractures of the shaft of the femur, of the tibia and some of the humerus often demand more traction than is possible by external appliances, and hence skeletal traction is needed either in the form of (1) a nail or pin transfixing the bone (Codivilla-Steinmann method), or, (2) tongs or callipers passed into the cortex of the bone (Ransohoff method), or, (3) a stirrup or loop of wire passed over the bone (Finochietto method). None of these devices should be left long in situ, and they can be removed within two weeks in the majority of cases if a heavy traction weight is used from the outset. They are methods of reduction only and no longer are used by us until union is well advanced, splints or external traction being substituted when the bone is definitely aligned. They are of especial service in compound or infected fractures because they can be inserted at a distance from the site of the trauma.

The ordinary joint fractures, such as those about the wrist (Colles' and Chauffeur's), or ankle (Pott's and variants), or elbow (supra-condylar and condylar) demand more accurate adjustment than shaft fractures if our patient is to escape disability and deformity.

Experience teaches us that children up to 16 years compensate by subsequent growth for even gross post-traumatic bone deformity, especially after fracture of the shaft of the femur. Joint fractures in children, notably if epiphyseal in type, are more likely to prove deforming and disabling than shaft fractures, and this is markedly true of elbow and knee fractures. Irrespective of age then, a joint fracture requires more accurate reposition than a shaft fracture. Prompt reduction under anaesthesia is essential and the first step in reducing any joint or shaft fracture is to increase the original deformity enough to thoroughly mobilize the part. Then traction and manipulation follow until (1) the normal bony landmarks of the joint or shaft are restored, (2) the deformity disappears, (3) pressure does not produce recurrence of the original deformity. When these three "tests of reduction" exist, that fracture is properly set.

and do not pull them off. Let the patient immerse the part in a hot iodine solution two or three times daily for half an hour, and while so immersed see that contiguous joints are moved.

Use a saturated solution of magnesium sulphate for so-called erysipelas cases. I say "so-called," for wound erysipelas is in reality streptococcus cellulitis that needs no special isolation, and certainly needs no ichthyol or any similar nasty smear as a dressing.

Hand infections should be incised, not carelessly, but in a perfectly definite manner, based on the known anatomy and pathology of the process. For finger tip infections of the felon type (a true osteomyelitis), split the pulpy pad of the finger vertically just in front of the nail and insert a rubber band. For hang nail infections, the paronychia group, incise upward from the edge of the nail toward the pad of the finger so that the matrix will be exposed.

For tendon infections of the finger group, make lateral incisions, on each side if necessary, but do not cross the web spaces and do not incise directly along the palmar surface. It is almost never necessary to cut on the back of the hand in any form of hand infection because the swelling in this location is a passive edema, rarely harboring pus in the absence of a definite focus or definite fluctuation.

Infections reaching the palm will occupy one of the three main cavities thereon, namely, the thenar, the hypothenar or mid-palmar space. Use the normal creases of the palm as the guide to these areas, having in mind the distribution of the palmar arches. For infection that spreads beyond the wrist into the forearm, make a lateral incision on the antero-external or antero-internal aspect, or both, and pass the drain across and under the tendons if necessary.

Do not use drains for more than a few days in these hand and forearm cases, for otherwise a slough of tendons or vessels will occur. Teach the patient to keep the fingers and the wrist and the elbow moving, otherwise pitiable and perhaps hopeless contractures will occur.

We must not forget that any infected wound leading to bone may be associated with osteomyelitis which is usually a streptococcus affair and hence will be subject to an exceedingly guarded prognosis as to immediate recovery, a period of latency and a subsequent recurrence. We know, I regret to say, very little more today about the treatment of osteomyelitis than our forefathers knew in Civil War days, and our own soldiers are again proving to us the tragedy of the old adage "once an osteomyelitis, always an osteomyelitis." Be especially careful then in dealing with any infection contiguous to or associated with bone.

The general care of an infected case is very important. When possible, expose the wound

surface to the sun, to the air, to electric light, for all these agencies promote healing. Keep all dressings off a freely draining or granulating wound and cover it instead by a wire mesh or celluloid cage. In such cases, a dressing is often nothing more than a pus poultice. When possible, get sea water for soaking or dressing the wound as this is of all the best to promote free drainage. Feed well an infected case. Plenty of milk and eggs and green vegetables. Give iron and quinine as a tonic where needed.

#### NOW AS TO FRACTURES

There are certain very definite but very simple rules governing our practice, and these are based on the law of averages. First, let us recognize that a fracture is a wound of bone, and like wounds of soft parts we can actually have an incised or slightly separated fracture, and a lacerated or much separated fracture. These non-overlapped fractures we call Type II, the overlapped group fall into Type I. The important thing is that the Type II set require splintage alone to promote healing, but the Type I set require reduction *and* splintage. In other words, we convert Type I into Type II before we splint. Either type can of course be simple or compound. Wounds of the soft parts heal well only when properly coapted and retained by sutures. Fractures act in the same way, the splint acting as an external suture.

The vast majority, yes almost 80 per cent, of joint injuries characterized by deformity and disability are fractures and not dislocations, the shoulder joint being the only exception. Hence in any recent deforming and disabling injury of a joint, this law of averages requires us to think first of a fracture, shoulder joint excepted.

We should acquire the habit of setting the fracture when first seen, using the X-ray to prove the success in our setting more than the success in our diagnosis. Show the patient or some responsible member of the family the X-ray, but always be prepared to state that an absolutely perfect adjustment is impossible in a hidden bone unless open operation is permitted, even then it is often impossible. State also that absolute or anatomical alignment is usually not necessary either as to function nor visible contour. State these things freely and openly, make no positive promises as to the outcome in terms of time, function nor appearance, if we do these things we will not be harassed by lawsuits nor will we be accused of bungling. Get X-rays when possible immediately after setting, and in the case of shaft fractures especially, check up by another X-ray in from seven to ten days, inasmuch as a fracture of the shaft of the arm, forearm, leg or thigh often "slips" after primary or immediate adjustment unless the fragments are well locked. This caution is especially neces-

to cope with the extensive lacerations of brain covering and brain substance that usually involves the inaccessible mid-brain

The after care in all these cases demands great watchfulness to prevent meningitis or other sequelae

#### DISLOCATIONS

A word of caution as to prolonged bandaging or otherwise immobilizing these cases. Dislocations like joint fractures are associated with arthrosynovitis and this is the pathology demanding attention and not the displaced bone, after the latter is set. No joint injury more requires early mobilization than dislocations, and to long immobilize a dislocated shoulder, for example, is to promote atrophy, invite recurrence and perpetuate disability

#### SUMMARY

An attempt has been made to epitomize some of the salient features of the treatment of traumata growing out of automobile accidents. Spe-

cial stress is laid on the necessity for complete sterilization of wounds, thus limiting infection and disability. Fractures are put also into the wound class and are classified in respect to their displacement and treated accordingly. Dislocations and joint injuries generally should be mobilized early. Infections of the hand demand special attention because they are now badly treated.

The time has passed when the juniors of the house staff "get" the accident cases, because many of these injuries are of such an unusual nature as to tax the most experienced of the visiting staff.

Traumatic surgery should be regarded as emergency major surgery far oftener, and the responsibility of the profession is growing because accidents are now much more numerous and much more severe, so that practically every physician, irrespective of his specialty or geographical location, may be suddenly called upon to treat a most important form of trauma in a most important type of individual.

---

### COMMUNITY NURSE\*

By F G METZGER, M D,

CARTHAGE, N Y

**T**HE success or failure of the community nurse depends principally upon three closely related factors

(1) The nurse, herself, is perhaps the most important. She must possess judgment, tact, ability and willingness to work, and a comprehensive knowledge of public health work. She must be impressed with the actual scope of her field of work and never transgress its rightful limitations of authority and medical practice. She should be firm enough to help enforce, impartially, the public health regulations, yet sympathetic in giving nursing care in cases of emergency relief. While the latter is not considered part of the duties of the public health nurse, it will, perhaps more than any other one thing, gain the confidence and support of the community.

(2) The community, once prevailed upon to employ a nurse, should co-operate fully in adequate compensation and financial as well as moral support in the various phases of the work. While the leaders in some communities figuratively belong to the ox-team age, fortunately these are in the minority, and the live, up-to-date governing boards will support any activity which has been proven of merit. This support must include the maintenance of an auto, which will

increase efficiency both in saving valuable time and physical effort, and is purely a business proposition, from the dollars and cents standpoint. A suitable office, centrally located, is very essential in the holding of the various clinics, an established feature of public health. Various clubs should be interested, not only for the financial support which they lend to the work of the nurse, but the members of these clubs, usually representing the influential element of the community feel a personal responsibility which makes for the good of the cause.

(3) The Health Officer should supervise the public health activities of the nurse, and he, alone should be responsible for the success or failure of her work. This applies equally well to the nurse doing school work as to the one doing Public Health only. Where such is not the case, there is bound to be duplication of effort and confusion, for who is or should be better qualified than the Health Officer to direct the Public Health Program. In communities sufficiently large to make this impracticable, it can be taken care of by a Bureau in the Health Department.

In concluding, I would say that the success or failure of the Community Nurse depends on a competent nurse working out a comprehensive Public Health Program in a manner that the community is convinced that its money is well spent.

\*Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, April 23, 1924

The position the limb should assume after reduction is not altogether answered by the old rule "splint in a direction opposite to the original deformity." We must of course overcorrect the existing malformation, but we must also bear in mind the best functioning position in the event of ankylosis. The following statements as to position after reduction are clinically valuable.

(1) In the supinated upper extremity preserve the carrying angle by aligning the acromion, external condyle and radial styloid in the lateral axis. In the vertical axis, align the coracoid, the middle of elbow, the middle of wrist and the middle knuckle.

(2) Splint wrist fractures in palmar flexion and adduction in the thumb up position. Splint hand fractures with wrist dorsally flexed.

(3) Splint all fractures above the wrist in full supination, with elbow at a right angle.

(4) Splint elbow fractures (olecranon excepted) in hyperflexion, with marked abduction of forearm.

(5) Splint clavicle fractures with a T-splint or other device to keep shoulders in the wearing-a-knapsack position, i.e., with shoulders drawn backward and upward.

(6) Splint ankle and foot fractures in hyperflexion and hyperinversion.

(7) Splint fractures of the leg and thigh to preserve the lateral carrying angle maintained by aligning the great trochanter, external condyle, external malleolus and head of fifth metatarsal. The vertical carrying angle is maintained by aligning the anterior superior spine, the tubercle of the tibia, the middle of the ankle and the base of the second toe. These two measurements we call the seam and crease of the pants lines.

For splintage, prefer always a removable splint permitting inspection and early massage and motion. As to duration of splintage, let us remove half the splint when union is firm ("lead pipe union") and the rest of the splint when union is solid ("iron pipe union"). We splint a joint fracture only about half the period we splint a shaft fracture, neck of femur excepted. There is practically no such thing as non-union in a joint fracture, again excepting neck of femur.

Beware of non-union oftenest in fracture of the lower third of the tibia, next in the radius, next the ulna, next the humerus. Essentially there is only one cause for non-union and that is non-coaptation due to interposition of hard or soft parts. Syphilis seems often to aid rather than retard fracture healing—witness for example the healing rate in tabetics and the insane.

When can I let the patient use the part? Use is permissible when no prolonged reaction (red-

ness, heat, pain, swelling) follows, (1) Rough massage, (2) pounding the part, (3) special tests of the part, (i.e., weight bearing or weight carrying).

These are the "tests for usage" employed by us, and in the lower extremity, crutches are early displaced by the use of walking callipers placed on the limb as soon as union is solid enough to remove the splints.

## HEAD INJURIES

There are three clinical groups usually encountered, and in at least one of these the diagnosis rests as between concussion alone, or concussion associated with laceration or skull fracture.

Group I may be called the mild group in which concussion is the main symptom, plus the associated shock and the succeeding headache, dizziness and perhaps mental confusion. Let us not forget that concussion means immediate temporary unconsciousness usually associated with nausea or vomiting. If the onset is not immediate, it is not true concussion, if it is not temporary, it is not true concussion. These cases usually recover without any special treatment aside from rest and careful supervision.

Group II may be called the moderately severe group of concussion plus vault or basal fracture. If the latter, and bleeding from the ear or nose is moderately free, self-decompression occurs and any later evidences of intracerebral pressure usually indicates serous effusion or infection. Operation is only indicated in this group for the relief of localizable pressure, and pressure in head injuries occurs only from bone, blood or foreign bodies. Decompression for the relief of basal fracture, or any other site of generalized intracerebral pressure, is a procedure now quite generally abandoned because greater relief can be obtained by the spinal tap, which is not only of therapeutic but also of diagnostic value. Relief of intracranial tension can also be obtained by a rectal drip of a 10 or 20 per cent magnesium sulphate solution. Operation for head injury designed to relieve demonstrable pressure from a clinical standpoint is usually demanded or warranted only for depressed fracture of the vault (especially if compounded) and for cortical hemorrhage as from middle meningeal hemorrhage.

The routine performance of trephining for head injury need only be mentioned to be condemned even in the presence of non-depressed extensive fracture. Children rarely require operation.

Group III may be called the severe group in which the cranial contents are so badly damaged that signs of intracranial damage are present from the outset. These cases are fatal in the vast majority of instances as surgery is unable

chairmen and members are expected to be the channels of communication between the Bureau of Legislation of the State Society and the local representatives in the Legislature

It is the conscientious intention of the Committee on Legislation to transmit up-to-date information in legislative matters to the local chairmen and members at the earliest possible moment. This information is sent through the columns of THE NEW YORK STATE JOURNAL OF MEDICINE, and by advance copies of the JOURNAL articles sent to the county chairmen and members of advisory committees

It is to be feared that the legislative columns of the JOURNAL are not always read with care. Many requests are printed in the JOURNAL that members write to their legislators regarding specific bills, but conversations with legislators show that too few letters are sent in response to these general calls to action. It is the intention of the Committee on Legislation to make an equitable division of the work of reaching legislators. When action on the more important bills is desired, the State Committee sends out special calls to the county chairmen, and puts the responsibility of action upon the local societies and their com-

mitteemen and members. But on lesser matters the State Committee on Legislation feels free to act.

If individual members of county societies fail to reach their legislators when they are requested, the work which they should have done must be apportioned among other members of the State Medical Society, and active men of honest convictions must suffer with the indolent and careless in the results of any inimical legislation that may be passed.

It is a reasonable expectation that the aggregate amount of work done by the Legislative Committees and members of the County Medical Societies in informing legislators would far exceed the amount done by the Committee on Legislation of the State Society. The proper division of work is that the Committee on Legislation should gather and distribute the information regarding medical bills, and that the county legislative committees should do most of the work of informing their legislators. This is an equitable division of the work. It is also the most effective, for if it is carried out, it will demonstrate that the practising physicians are sincerely trying to assist their legislators in framing laws for the public good.

J N V V

## THE PHYSICIAN IN PUBLIC HEALTH

Physicians generally are beginning to recognize their direct duties in public health matters, and to seek channels by which they may express their opinions and secure action in accord with their convictions. They are ready to act through their medical societies, and to give time and effort in advising governmental bodies regarding any of their actions which affect public health. It has heretofore been the argument of lay welfare organizations that physicians have not taken part in public health movements. This criticism is no longer true. Physicians are ready and anxious to respond to public health needs, as is abundantly proved by the actions of several County Medical Societies in appointing advisory committees whose services are at the disposal of Boards of Supervisors and other governmental bodies.

An opportunity to recognize the local physicians and give them definite responsibility is afforded by Senate Bill Int. 283 Assembly Int. 399, on which we commented in the editorial columns last week (page 265). This bill authorizes Boards of Supervisors to employ public health nurses at county expense. The Committee on Legislation of the Medical Society of the State of New York believes that the employment of public health nurses by county governing boards is a most excellent idea. The Committee also approves the lines of work which the

nurses may undertake. But it does not approve the machinery under which the nurses will work if the bill should become a law in its present form.

Health officers naturally desire to avail themselves of the services of public health nurses, but primarily health officers are physicians, and on the shoulders of the local physicians must rest the ultimate responsibility for the health of the people of a community. The proposed law will apply principally to rural counties, and in these counties the practising physicians form a group which is the best qualified of all groups of persons to understand public health needs and the methods which are best suited to remedy local conditions. Moreover, the physicians of every county have an efficient organization in an active County Medical Society.

The editorial columns of this Journal have contained many comments regarding the practice of Civic Medicine by County Medical Societies, and the news columns have recorded the official actions of several county medical societies in taking the lead in public health matters. The time is at hand when the State Department of Health, the State Department of Education, local Boards of Supervisors, and lay welfare organizations may expect full co-operation from the official organizations of physicians.

When a new method of action affecting public

## THE MEDICAL LEGISLATIVE MACHINERY

Last week we commented on the circle of legislative influence which emanates from the Albany headquarters of the Committee on Legislation of the Medical Society of the State of New York. The object of our comments was to inform the members of County Medical Societies regarding their position in the legislative machinery of the State of New York.

The Committee on Legislation of the Medical Society of the State of New York consists of Dr J N Vander Veer of Albany, Dr George R. Critchlow of Buffalo, and Dr Walter H. Conley of New York City, each of whom is experienced in medical legislation. There are thus three centers of influence—one in the western end of the State, one in the southeastern end,

and one in the central part of the State, in close touch with legislative matters. Each committeeman is ready to relay and amplify information to the chairmen of county legislative committees and the members of the Societies. Each committeeman is also ready to supply currents of force which shall activate the officers and members of the county medical societies—and there is great need for such activation.

It is physically impossible for the Committee on Legislation to see the entire group of two hundred legislators in Albany, and so the main dependence for seeing the individual legislators must be placed on the chairmen of the legislative committees of the county medical societies, and on the members of the societies. The local

We dislike to admit that there is any need of a code of ethics for public health nurses, but we sincerely hope that Miss Gregg will formulate a tentative code, and we assure her of the co-operation of the medical profession. But still we cannot help feeling that a public health nurse has missed her calling if she requires a code of ethics to regulate her conduct. We have painful

memories of our attempts to formulate public health nursing rules on one occasion when we drew up two pages of general regulations to fit a particular situation, and then when the nursing staff changed, we threw them into the waste basket and adopted only the principles of politeness and consideration for others for the guidance of future nurses.

### LABORATORY DEMANDS CLINICAL DATA OR WILL CHARGE FEE FOR SUPPLIES

The value to the physician of well kept records needs no defense or explanation. Every physician, at some time or other, makes an effort to develop a set of records at least upon the important cases in his practice, but unless he has stenographic service in his office, he, sooner or later, finds that his most interesting records are encountered at the time when he is the busiest, with the result that by the time he has passed the busy period, his records are so far behind that it proves too much of a burden to bring them up to date, and most of them are thus discarded. Nevertheless, this does not detract from the value of record keeping.

The State Department of Health finds it exceedingly important that certain records concerning the clinical findings from patients from whom specimens are to be examined, and, likewise, patients upon whom therapeutic products are to be used, should be filed with them in order that they may co-ordinate their laboratory work with the clinical work of the physician. The majority of the physicians realize this, and have been co-operating in a very encouraging way. There are some physicians, however, who consistently do not supply information requested when submitting specimens for diagnosis, or when requesting therapeutic products for administration. While this number is small, it seems to the Department of Health to be of sufficient importance to warrant their introducing a bill, Assembly Introductory No. 1167, entitled, "An Act to amend the public health law in relation to district laboratory supply stations," which would permit the Commissioner of Health to collect fees from physicians who neglected to supply the information requested concerning the patients in whose use the supplies were withdrawn from the station.

It seems unfortunate that a bill of this character is thought necessary, because it is the State Department of Health's function to protect the public against the spread of communicable dis-

eases, and all of the products implied in this law have to do either with diagnosis or treatment of communicable diseases only.

In the past, the efficiency of the laboratories has largely been attributed to the fact that supplies were furnished without cost to all physicians who applied for them. While originally, the idea was that these supplies were intended only for indigent patients, the importance of protecting the public has long since sanctioned the use of diphtheria antitoxin on every child suffering with the disease, regardless of whether a parent could or would pay for the product. It was considered important that the State, with its product provided by public money, should exert itself to protect the public against the spread of a communicable disease immediately on its appearance that it appeared without debating whether the infected one should pay the State a fee for the benefit he would derive from the use of said products.

It would be regrettable if this bill should result in raising a question as to whether or not a busy doctor should receive products from a supply station because he had failed to file requested information from the last supplies given, and thus the community be endangered of infection, or if he would find it difficult to secure the therapeutic products demanded in cases of emergency, because he had failed to pay the fees exacted for the last products he had secured.

We do not question the importance of the State Department of Health having and collecting accurate records concerning the work it does, but we believe that there is sufficient authority in the law, as it now stands, to enable them to secure such information. The proposed bill is unnecessary, and its disturbing effect on the 98 per cent of physicians who are practising according to the law is greater than the co-operation that will be secured from the 2 per cent against whom it is aimed.

J S L

health in a local community is introduced, it would be expected that the local physicians should be recognized, their advice sought, and their full co-operation secured

The closing paragraph of Senate Bill Int 283 makes a brief reference to physicians in that it *permits* a Board of Supervisors to appoint an advisory committee, one of whom shall be a physician, and one a woman. The Committee on Legislation has suggested that the appointment of an advisory committee be mandatory, that the majority of its members be physicians, and that the physician members shall be chosen, or at least nominated, by the County Medical Society.

There is need that the work of county public health nurses be kept up to certain standards, and the standards which are recognized and are acceptable are those of the State Department of Health. The Committee on Legislation has suggested that the bill be made to read that the qualifications of the nurses and their methods of work shall be in accordance with the standards set by the State Department of Health, and that the State Department of Health may make inspections of the work of the nurses. Permissive inspections rather than supervision is in accordance with the policy of the State of New York in regard to the finances of local communities

and the methods of conducting the various phases of strictly local government.

The proposed bill causes the nurses to serve four masters—the Board of Supervisors, the State Department of Health, the educational authorities both state and local, and the individual attending physician. The Committee on Legislation has suggested that the bill shall provide that the Committee of the Board of Supervisors may assign a nurse to work in a public school or with a local health officer, and that when the nurse is thus working, she shall conform to the directions of the officers and the law of the local body for whom she acts.

The Committee on Legislation feels that this proposed law involves the whole principle of the recognition of the influence of local physicians in the public health affairs of local communities. This principle is more far-reaching than the mere employment of public health nurses. It involves the recognition of local physicians in public health matters, and affords an opportunity to secure the co-operation of physicians in governmental participation in public health work. We are confident that the members of county medical societies will act worthily of the trust bestowed upon them if the bill should pass after it has been amended as we have proposed.

## A CODE OF ETHICS FOR PUBLIC HEALTH NURSING

The New York State Department of Health Quarterly for January, 1925, contains an unusual article on the Ethics of Public Health Nursing by Elizabeth Gregg, Executive Secretary of the Association of Tuberculosis Clinics, New York City. Miss Gregg gives a truthful definition of unethical conduct in that she calls it impoliteness and rudeness. We have often puzzled our brains to explain wherein one's conduct become unethical, and now we wonder that we missed the point which Miss Gregg makes clear.

Consideration for all other persons constitutes the essence of the ethics of any profession, and is especially applicable to nurses and physicians. Ethics in public health nursing is simply that the nurses shall have a high regard for the feelings of those with whom they come in contact.

Miss Gregg also discusses *personality*, by which she means the ability to "get on" with people generally, and she asks "What is this right personality but the habit of applying ethical principles in our everyday life? It is the practice of our moral duty to ourselves and to those with whom we come in contact."

Miss Gregg discusses the ethical duties of nurses along five lines: 1, to their superiors, 2, to their fellow-workers, 3, to the public, 4,

to themselves, and 5, to their subordinates. She devotes only a few lines to the ethical relations of nurses to physicians, but she sums up the whole matter in a line that if the nurse herself cannot straighten out a misunderstanding with a physician, she shall refer the matter to her superior, "and then ethics requires that she talk no more about it."

Our experience is that it is not the original misunderstanding that causes trouble, but that the irritation comes from the continual talking in which the nurse is likely to indulge. A "chip on the shoulder" is not the honorable badge of distinction which some public health nurses may seem to think it is. Every physician honors a nurse whom he considers to be a "good loser,"—that is, one who is brave enough to treat a doctor with undiminished cordiality after a misunderstanding with him.

Miss Gregg closes with a suggestion, "A printed code which would outline the ethics of public health nursing would be as needful and beneficial as the handbook on the practical aspects of their work. Ethical duties would be set down as cold facts, and would be received as truths, and not as preaching or moralizing, and would have the force of orders."

We dislike to admit that there is any need of a code of ethics for public health nurses, but we sincerely hope that Miss Gregg will formulate a tentative code, and we assure her of the co-operation of the medical profession. But still we cannot help feeling that a public health nurse has missed her calling if she requires a code of ethics to regulate her conduct. We have painful

memories of our attempts to formulate public health nursing rules on one occasion when we drew up two pages of general regulations to fit a particular situation, and then when the nursing staff changed, we threw them into the waste basket and adopted only the principles of politeness and consideration for others for the guidance of future nurses.

## RE-REGISTRATION AND OTHER FEATURES OF THE KARLE-DUNMORE BILLS

As a citizen you are entitled to vote upon all questions submitted to the electorate, but before you exercise that privilege, you are required to be duly registered each year as such a voter. In the cities you must personally appear before the poll clerks and answer numerous questions and affirm your answers to the questions by signing your name in the roll. This is something of a nuisance, but it also prevents thousands of unqualified or unscrupulous people who are not entitled to vote, from voting, and is a curb upon any individual voting more than once. Such annual registration of voters is regarded now as indispensable to the maintenance of pure elections, and therefore, such annual registration is requisite as a condition to the exercise of the franchise and keeps away from the polls those not qualified to vote.

When you go to a hotel and before you are assigned to a room you are required to register, so that the hotel proprietor may be informed as to the identity of his guests and know to whom he has legal obligation as an innkeeper. You go to your lodge, and before you are admitted you must be identified. When you are called on a panel as a juror, you must each day be registered by the clerk as present before you are permitted to sit on a case. Employees of large, and many small, concerns, must daily register their presence, as well as the time of their arrival and departure by one system or another of registration.

You board a train, and you must register your right to passage by the possession of the necessary ticket which identifies you as one to whom the railroad owes a definite legal obligation. Practically in every form of social or business organization, the first order of business is the calling of the roll in order that each person entitled to membership may be registered and identified.

So examples may be multiplied. Can it be said that any of these laws, regulations or procedures for registration are in the nature of a deprivation of the individual's rights? Are they not, on the contrary, methods and means by which the rights of the individual may be enforced as against those who are not entitled to such rights? And are they not, therefore, procedures by which protection is given to the individual?

For about forty years doctors who are entitled to practice and who have received licenses have

been required, before undertaking any practice, had to record their licenses in the office of the County Clerk of the county in which they intend to practice. Many doctors belong to numerous organizations, and at the time they join they sign the constitution and by-laws and thus register themselves as entitled to membership.

What would you think of an organization that had a membership of sixteen thousand, where the privilege of membership granted an exclusive right of making a livelihood in a definite line of work the preparation for which required years of study, if such organization should permit thousands of others who were not members, and who were not eligible, to enjoy all the fruits of such membership because such organization had never taken the trouble to adopt a method by which it could check up its members and exclude the interlopers? In other words, would you not be in favor, at least once a year, of having the roll called and have each member identify himself for his own protection?

There has never been a roll call of the medical profession of the State of New York for about forty years. Doctors, as far as identifying themselves as entitled to practice, as separate and apart from the many charlatans and quacks who are not entitled to practice, by being recorded once in their lifetime in the office of the County Clerk, might just as well have their names inscribed in the Domesday Book. The County Clerk's record, for all practical purposes, is just as antique and about as useless.

Let us for the next five years have a roll call once a year and let the duly licensed doctors answer. Here, and the first time the roll is called after forty years let us be assured that the man who is answering "Here" is the right man, and not an impersonator of someone else. Let us have him thereafter take oath to that fact and for the following four years, if he is identified with the County Medical Society, let its secretary answer "Here" for him.

Would this procedure be considered by any sensible man as an infringement of his rights and prerogatives as a duly licensed practitioner of medicine? Can any sensible man fail to see the wisdom of such a roll call? It is going to take some money to call this roll for the next five years, to provide the necessary machinery for that purpose. It is going to take some money, after the roll is called, to put out of the meet-

ing a large number of those claiming to exercise the same rights as you do as doctors, and possibly particularly obstreperous ones may have to be safely lodged in jail. Should we stop at merely calling the roll, leaving those who are not entitled to answer "Here" free to exercise all the rights and privileges of membership in the medical profession, or should we not complete what we start when we call the roll and take whatever measures are necessary to exclude the unqualified? Can any man answer other than affirmatively to any of these propositions? Are you willing to pay two dollars a year for five years, or a total sum of ten dollars, to accomplish this result? Can you think of where ten dollars for a period of five years could be better spent? Are you willing to have the man who would like all of the benefits from such a system, but who won't pay the ten dollars, partake of the benefits at your expense? Or are you not willing to equalize this expense by taxing all who are entitled to answer the roll call two dollars a year for five years?

The Karle-Dunmore bills, sponsored by the State Department of Education, seek by their terms to obtain an honest, true list of registered doctors in this State for the first time in forty years. They seek, after obtaining such list, to make it very hard for those who are not entitled to practice, to do as they are now doing and have been doing for many years—practicing without a license. They seek to provide state-wide machinery, after calling the roll of the registered practitioners, to inspect and find out all those who are practicing who are not on the list, and to mete out to them suitable punishment. As it is practically impossible to have this done at the expense of the entire State as it should be, the Karle-Dunmore bills provide that the doctors who are registered, for five years shall pay annually two dollars a year in the cleanup campaign.

It seems hard to take seriously the claims of some doctors that they are opposed to this plan as a matter of principle. How small this principle urged as an objection looms in comparison to the ultimate principle for which the profession must always strive, of restricting the practice of the healing art to the educated and qualified, for the public good! While fighting for the small principle of taxation which involves an expenditure for a period of five years not to exceed ten dollars, by obstructing the Karle-Dunmore bills in their passage in the Legislature, what violence are you doing to this principle for public protection, which has for its purpose and foundation the saving of human lives? Some assert that the present system and present laws are sufficient to vindicate the principle that only the licensed shall practice. The past forty years of history in this State controvert the assertion

Some people have asserted that to permit a registration fee to be imposed for five years upon the doctor would jeopardize his vested interest in his license. The license does not create a vested interest. It does not create a title. It is a mere grant of permission to do certain acts that to the general public are prohibited, and is subject to legislative control, change, amendment, or even abrogation. What is to be gained by fooling one's self as to the nature and legal character of a license? Why lull oneself into a state of false security and self-satisfaction and impregnability based on a false legal premise?

The provisions for registration and the penalties provided for failure to register do not in anywise affect one's license. They are in the nature of ordinances to be complied with and non-compliance does not destroy the license or in fact affect it, but they do subject the non-conformist to certain financial penalties, which are exclusive and the only penalties for non-conformance.

If you have title to a house and lot in a city or town, the municipality has a right to pass certain ordinances with which you must comply or pay certain penalties, such as requiring you to separate garbage from ashes, to keep your sidewalk clear of snow and ice, and the like. Failure to comply with these ordinances does not affect your title or your right to your house and lot. Similarly, non-compliance with the registration features do not affect your right to license, but does subject you to other small penalties, having no relation whatsoever to your license.

Under the present law a large class of persons are exempted from the operation of the Medical Practice Act, whereas when such exemptions were created it was intended only to permit such exempted classes to do certain things. Under these exemptions we see chiroprodists advertising themselves as doctors, we see those engaged in fitting artificial limbs and eyes and glasses holding themselves out as doctors. The Karle-Dunmore bills will put a stop to such acts and create only limited exemptions to those entitled thereto. Criminal and civil penalties are provided to curb the unlicensed practitioner, and the district attorney of each county shall prosecute all offenders, the attorney general may supersede him should he fail in his duty. Fraudulent medical advertising is specifically prohibited. Advertising of fake cures and the cure of incurable diseases, and advertising the use of secret methods of cure are forbidden, so that the ethical man does not have unfair competition from the quack. Patients treated by unlicensed practitioners may sue and recover damages for injuries they suffer, and proof of their case is made very simple under favorable rules of evidence created by the act. The enforcement of the Medical

Practice Act is centralized in the hands of the Regents and the Attorney General, who may employ inspectors to search out and prosecute offenders. The rights of the physician as now existing are preserved and further safeguarded in proceedings directed toward the revocation of his license, and yet the malefactor may be more readily punished.

It is the privilege of every doctor in this State to take a definite stand on these bills and to record his position with the State Society. On March fourth, in the Assembly Chamber at

Albany, the joint committee on public health of the Senate and Assembly will hold a hearing on these bills. The representatives of the State Society will be present to carry out the will of the Society. The Assembly Chamber will be crowded with chiropractors, naturopaths, drug less healers, quacks, and various nondescript fakirs, who will loudly voice their opposition, realizing that the passage of the bills would be the death-knell to the unlicensed practitioner.

"No man e'er felt the halter draw  
With good opinion of the law"

### CLAIMED NASAL OPERATION ON MINOR WITHOUT CONSENT OF PARENT

This action was instituted by the mother, as guardian of her infant child. It was alleged that on the 5th of May a tonsillectomy was performed and that the surgeon was paid for his services, that subsequent to the operation the plaintiff visited the defendant's office pursuant to his direction, that on the 13th of May the infant plaintiff, accompanied by his father, again visited the defendant's office, that on that day without any knowledge on the part of either the father or the infant plaintiff and without their direction or consent, it is claimed that the defendant negligently and wrongfully and by his error performed an operation upon the infant plaintiff's nose and the child was thereby rendered ill and caused to suffer pain in his nose and head. For this they sought money damages.

It appears that the mother of the infant plaintiff had called upon the defendant surgeon for the removal of her son's tonsils. She did not bring the boy for examination, as it was her desire not to interfere with his school hours. Arrangements were then made for the performance of the tonsillectomy and the amount of compensation agreed upon and paid. Upon examination of the boy, the surgeon found a small spur on the cartilagenous septum and told the parents of the condition and that some day he would remove the small spur. No response was made by the father, the surgeon assuming that he understood when spoken to. Arrangements were made for the performance of the tonsillectomy

on Friday, so that the child might return to school on Monday. After the removal of the tonsils, the child returned to the surgeon's office for post-operative examination and treatment. Upon the last of these visits, the child being accompanied at that time by his father, the surgeon stated that he would remove the spur from the septum. The child was prepared for the operation by the surgeon's nurse, she also prepared the necessary instruments and the surgeon, in the meantime, preparing himself for the performance of the operation. A local anaesthesia was applied. The operation was then performed and the spur removed. During all of this time the father remained at the side of his son and observed everything that was done. No objection was made by the father at any time. In fact, he never spoke during the treatment and operation.

The plaintiff's chief contention was that the surgeon had confused the boy in this case with another child, whom he was to operate upon on the same day.

After the prosecution of this action for several years, the examination of the defendant before trial and the taking of the deposition of witnesses, the action finally came on for trial. Because of prejudicial error by plaintiff's counsel, occurring during the trial, the court declared a mistrial. The case was then restored to the calendar for a new trial, at which time the plaintiff's attorney not being ready to proceed with the re-trial a dismissal was had of the complaint.

	Senate Int 789, Senator Bouton's Chiropractic Bill
Assembly Int 908, Control of Sale of Wood Alcohol	
	Assembly Int 987, Birth Control

## SUMMARY OF BILLS INTRODUCED IN LEGISLATURE IN SENATE

### The Narcotic Bill

Senate Int No 115 (conc Assembly Int 215)  
—A bill introduced in the Senate by Senator Morton J Kennedy of New York, concurrent Assembly Int 215, by Assemblyman Morris Weinfeld of New York, would add new article 22, and amend section 4-b, Public Health Law, and repeals section 1746, Penal Law, relative to habit forming drugs

Referred to Public Health Committees of both Houses

Still in committees

*Comment* It must be realized that certain interests are deeply concerned with keeping this bill in the committees, and if the Medical Society is anxious to forward good legislation, here is an opportunity to write and ask the Chairmen of these two committees of Public Health in Senate and Assembly to bring the bill out

### Requiring the Licensing of Private Institutions for the Treatment of Drug Addicts

Senate Int No 116 (conc Assembly Int 216)  
—A bill introduced in the Senate by Senator Morton J Kennedy of New York, concurrent Assembly Int 216, by Assemblyman Morris Weinfeld of New York, would add new section 177, Insanity Law, requiring the licensing of private institutions for treatment of narcotic drug addiction

Referred to General Laws Committee of Senate, and to Judiciary Committee of Assembly

Still in committees

*Comment* This bill is still in the committees and the same comment applies as in the previous bill

### The State Department of Education Bill Amending the Medical Practice Act

Senate Int No 211 (conc Assembly Int 307)  
—A bill introduced in the Senate by Senator John L. Karle of Queens County, concurrent Assembly Int No 307, introduced in the Assembly by Assemblyman Russell Dunmore of Oneida County, would amend Sections 164, 169, 170, 173, 174, and repeal section 171, Public Health Law, relative to practice of medicine, by providing among other things for the registration and licensing of physicians

Referred to Public Health Committees of both Houses

*Comment* Attention of the members of the Medical Society is called to the fact that our *chiropractic bill* (Mr Esmond's Assembly bill, Int No 649) reads almost word for word the same as this Medical Practice Act, and omits the sections which are obnoxious to chiropractors and adds on sections which would permit of their practicing through the legal verbage added on

Extreme caution and precise care must be used by each County Chairman and individual in discussing medical and chiropractic legislation that these two bills may not be confused, as is evidently the intent, and in drawing this chiropractic bill in such a manner to befog the mind of the legislator when ultimate voting comes up

### Inspection of Children's Institutions

Senate Int No 228 (conc Assembly Int 236)  
—A bill introduced in the Senate by Senator J Griswold Webb of Westchester County, concurrent Assembly Int 236, by Assemblyman T C Moore of Westchester County, would amend State Charities Board, among other things, to visit all institutions in which children are received or cared for, and to establish rules therefor

Referred to General Laws Committee of Senate and to Judiciary Committee of Assembly

*Comment* Your Committee on Legislation has no further comment to make on this bill and as no communications have been received from individuals or county societies "for" or "against" the bill, the same will be dropped unless vital changes are made therein

### Qualifications of Examiners in Lunacy

Senate Int No 263—A bill introduced in the Senate by Senator James A Higgins of Kings County, would amend section 81, Insanity Law, relative to qualifications of examiners in lunacy

Referred to General Laws Committee

*Comment* No further comment having been offered and there seeming to be some opposition from other sources to this bill, your Committee on Legislation is inclined to remain neutral in the situation, taking the position that physicians who are now acting as examiners in lunacy and those who may become so later are disinterested to the degree that they wish no further work done on the part of the Committee on Legislation. It would seem that the bill will not pass, and therefore the present position of such officials will remain in statu quo

### County Public Health Nurses

Senate Int No 283 (conc Assembly Int 399)  
—A bill introduced in the Senate by Senator J Griswold Webb of Clinton Corners, N Y, concurrent Assembly Int No 399, by Assemblyman Frank H Lattin of Orleans County, would amend section 12, County Law, by authorizing county supervisors to provide expenses for public health nurses, who shall work under the public health committee or board, providing for appointment of advisory committee of citizens and relative to duties of nurses

Referred to Internal Affairs Committee of both Houses

*Comment* Your Committee on Legislation hopes that a conference is about to be held which may eliminate the objectionable features in the bill as have been outlined by the members of the Society who have been conscientious in offering their thoughts in relation to the bill and as the bill still reads opposition still maintains, but it is almost assured that the thought contained in the bill will be carried out satisfactorily to the members of the Society and to the various parties interested in the question

#### Health Service in Schools

Senate Int No 302 (conc Assembly Int 748)  
—A bill introduced in the Senate by Senator Ernest E Cole of Bath, N Y, concurrent Assembly Int 748, by Assemblyman Irving F Rice of Cortland County, would amend sections 571, 571-a, 572, 575, Education Law, relative to medical inspection and health service in public schools

Referred to Public Education Committee of both Houses

*Comment* It is evident there does not seem to be much interest in this bill as we have received no comments from County Chairmen or individuals and consequently this bill will be dropped unless there be amendments added thereto

#### Free Choice of Physician

Senate Int No 380 (conc Assembly Int 570)  
—A bill introduced in the Senate by Senator Daniel J Farrell of Kings County, concurrent Assembly Int 570, by Assemblyman Gerald F Dunne of Kings County, would amend Section 13, Workmen's Compensation Law, relative to medical and surgical attendance of injured employees by providing employee shall select physician

Referred to Labor and Industry Committees of both Houses

Still in committee

*Comment* No further comment than that the County Chairmen and individual members of the State Society should work for the passage of the bill

#### The Drugless Practitioner Bill

Senate Int No 473—A bill introduced in the Senate by Senator Leonard W H Gibbs of Erie County, would add new article 13-a, Public Health Law, relative to practice of all systems or sciences constructed or developed for treatment of disease and the removal of abnormality, injury or deformity of human beings, except practice of medicine, osteopathy and Christian Science

Referred to Public Health Committee

*Comment* "The Medical Society quite naturally is against the Drugless Therapy Bill, the same as cult practice, and in both instances reference to the past will show without question that we are opposed to any and all special legislation

which would delimit the safeguards even one iota that up to the present have been created in behalf of the health of the public

"The medical profession has learned through the channels of science, in many instances slowly permeating through the profession, that didactic facts had to yield to scientific modification in the treatment of diseases

"We are utterly and absolutely opposed in the medical profession to anyone attempting to practice on the health of the people unless the practitioners have had a thorough ground work in the basic principles involved in the treatment of disease, the same as success only can be brought with the man who studies his business from its very beginning upward, else a prolonged pain and death come to the sick one, the same as sorrow and failure comes to the business man and his associates when he is not familiar with every phase of his business

"The basic law does not forbid of a man transacting business along certain general lines, but it does say he shall not commit forgery, and in most instances shall not be deceitful in his business conduct, and just so in medicine, after a proper education there are only certain restrictions to be thought of as how a patient shall be treated differently from the ordinary accepted view "

Attention of members of the Society is called to the article on page 267, of THE NEW YORK STATE JOURNAL OF MEDICINE for February 20, 1925

Relentless opposition *must* be waged against such a low type grade of bill

#### Inspection of School Children

Senate Int No 586 (conc Assembly Int. 850)  
—A bill introduced in the Senate by Senator Ernest E Cole of Bath, New York, concurrent Assembly Int 850, by Assemblyman Irving F Rice of Cortland County, would amend section 570, Education Law, relative to medical inspection of school children by excepting only cities which were cities of the first class on August 1, 1913

Referred to Public Education Committee  
No further comment

#### Free Choice of Physician

Senate Int No 594 (conc Assembly Int 301)  
—A bill introduced in the Senate by Senator William Love of Brooklyn, N Y, concurrent Assembly Int No 301, by Assemblyman Frank H Lattin of Orleans County, would amend the Workmen's Compensation Law, by permitting injured employees at employer's expense to engage medical or other attendance

Referred to Labor and Industry Committees of both Houses

See comment under Senate Bill Int No 380

### Practical Tests of Injured Persons

Senate Int No 647 (conc Assembly Int 184)  
—A bill introduced in the Senate by Senator Frank E Johnson of Brooklyn, N Y, concurrent Assembly Int 184, by Assemblyman F A Miller of Brooklyn, N Y, would amend section 118, Workmen's Compensation Law, by authorizing physical examinations and practical tests of claimant to determine loss of use and proportionate loss of use of a member, result and test to be a part of record

Referred to the Labor and Industry Committees

*Comment* No communication has been received from Mr Johnson or Mr Miller relative to the letters sent them as to the questions of whether the bill means that a layman shall make the examination, therefore your Committee on Legislation feels that opposition should be voiced to the bill by County Chairmen in the present form in which it now reads, and that communications so sent to the Committees on Labor and Industry of both Houses and to the introducers of the bill should include the suggestion that the bill be amended whereby the examination shall be made by a physician, and to be made perhaps in the presence of the lay deputy

### Physically Handicapped Persons

Senate Int No 671 (conc Assembly Int 868)  
—A bill introduced in the Senate by Senator Ernest E Cole of Bath, N Y, concurrent Assembly Int No 868, by Assemblyman John Boyle, Jr, of Suffolk County, would amend sections 2, 5, 23, Children's Court Act, Sections 130, 132, 136, State Charities Law, Sections 275, 310, 573, 650, 652, 653, 1020, 1200, 1201, 1203, 1204, 1206, 1208, adds new sections 1203-a, 1208-a, Education Law, relative to physically handicapped persons

Referred to Judiciary Committees of both Houses

*Comment* It would seem that the members of the Society by their negations are in favor of this omnibus bill and neglected to note in section 23, Children's Court Act, that the old law allows "a physician or psychologist appointed or designated for the purpose by the court" should in such a bill be amended to read "by a physician duly licensed to practice in this state"

It will be noted that the word "indigent" has been stricken out. Therefore, all children are now included under the court jurisdiction "who are physically handicapped" whether their parents be able to pay for them or not

Section 132 of the State Charities Law, has a new clause introduced whereby the board of managers of the New York State Orthopedic Hospital for Children at West Haverstraw "may

receive or collect from parents, and so forth," which now makes this hospital an institution where physically handicapped children of even wealthy parents may be committed and the parents, guardians, etc, be compelled to pay for the maintenance of that child

Section 136, State Charities Law, by new matter, gives preferential admission to indigent children and provides for records concerning the children upon admission, the treatment given, and the results, condition at time of discharge and the reason for discharge, to which records the State Advisory Committee for physically handicapped persons shall have access at all reasonable times

Section 7, Children's Court Act, which would under this omnibus bill give power to provide education in various schools, even to home teaching, and makes it mandatory on recommendation of the State Department of Health that surgical, medical, or therapeutic treatment, hospital care, crutches, braces and other appliances must be furnished

Section 573, Education Law, is amended so as to make it mandatory upon each principal or teacher of public schools to furnish to the medical inspector the names of all physically handicapped children

Section 13, Education Law, is amended so that the Board of Education of each city is required to furnish educational facilities for these physically handicapped persons

Section 1203, Education Law, is remodeled so that the advisory commission for physically handicapped persons as now so-called, shall be composed of the Commissioner of Education, who shall be chairman, the State Industrial Commissioner, the Commissioner of Health, and there is added the president of the State Board of Charities

Section 1203-a, states the purpose of the commission

1 To rehabilitate persons needing and capable of rehabilitation

2 To stimulate all private and public efforts and to coordinate them with the work and functions of governmental agencies designed to relieve, cure, or educate physically handicapped children

In general your Committee on Legislation can do naught but further such a bill which would help physically handicapped persons

### Dissection of Dead Bodies

Senate Int No 681 (conc Assembly Int 986)  
—A bill introduced in the Senate by Senator Ernest E Cole of Bath, N Y, concurrent Assembly Int 986, by Assemblyman Irving F Rice of Cortland County, would amend sections 2211, 2215, Penal Law, by providing in cases in which

right to dissect dead body is conferred by law, such body may be incinerated, section now requires burial

Referred to Codes Committee in both Houses

*Comment* The bill will be dropped

#### **Amendment for Admission of Foreign Practitioners**

Senate Int No 693 (conc Assembly Int 950)  
—A bill introduced in the Senate by Senator John L. Karle of Queens County, concurrent Assembly Int No 950, by Assemblyman Frank H. Lattin of Orleans County, would amend section 166, Public Health Law, relative to practice of medicine by a bachelor of medicine from a medical school in a foreign country

Referred to Public Health Committees in both houses

No further comment as yet

#### **Revocation of License to Practice Medicine**

Senate Int No 701—A bill introduced in the Senate by Senator Nathan Strauss of New York, would add new section 170-a, Public Health Law, empowering Supreme Court to revoke license to practice medicine

Referred to Public Health Committee

No further comment

#### **Rural Hygiene**

Senate Int No 716 (conc Assembly Int 969)  
—A bill introduced in the Senate by Senator Leigh C. Kirkland of Randolph, N. Y., concurrent Assembly Int 969, by Assemblyman Frank H. Lattin of Orleans County, would add new article 2-b, Public Health Law, establishing provision of rural hygiene in State Department of Health and appropriating \$10,000

Referred to Finance Committee of Senate, and to Ways and Means Committee of Assembly

STATE OF NEW YORK,  
No 748,

IN SENATE, Int 716

February 12, 1925

Introduced by Mr. Kirkland—read twice and ordered printed, and when printed to be committed to the Committee on Finance.

#### **AN ACT**

To amend the public health law, in relation to establishing in the state department of health a division of rural hygiene, and making an appropriation therefor

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to public health, constituting chapter forty-five of the consolidated laws," is hereby

amended by inserting therein a new article, to be article two-b, to read as follows

#### **ARTICLE 2-B**

##### **DIVISION OF RURAL HYGIENE.**

Section 18-d Division of rural hygiene.

18-e Assistants and employees

18-f General powers and duties of the division

§ 18-d Division of rural hygiene There is hereby established in the state department of health, a division of rural hygiene, the object and purposes of which shall be to co-operate with statewide and local organizations in promoting and protecting the health of residents of the rural districts of the state

§ 18-e Assistants and employees The state commissioner of health, within the limitation of appropriations made therefor, may employ, for the work of the division of rural hygiene, a director who shall be a physician qualified in public health administration, and such other assistants as may be necessary Within the amounts appropriated he may also incur such other expenses as may be necessary for carrying out the provisions of this article

§ 18-f General powers and duties of the division The state commissioner of health, through the division of rural hygiene, shall act in an advisory and superadvisory capacity in matters pertaining to the objects and purposes of such division, and shall, in such manner as he deems practicable, co-operate with statewide and local organizations in promoting and protecting the health of residents of the rural districts of the state

§ 2 The sum of ten thousand dollars (\$10,000), or so much thereof as may be necessary, is hereby appropriated for the purposes of this act, out of any money in the treasury, not otherwise appropriated

§ 3 This act shall take effect immediately

*Comment* This bill is not quite as the title would lead one to think and while its powers are broad in definition it would create within the State Department of Health a new "division of rural hygiene"

Attention is called to the breadth of section 18-d which, of course, is where the question lies, and the objects of which would seem to be able to be accomplished by the district state health officer

As the State Department of Health is now constituted the medical profession have nothing to fear from this type of bill, provided that the rules and regulations relative to this provision of rural hygiene may not be drawn so as to exceed the purport of the law

**Mental Deficiency Law**

Senate Int No 743—A bill introduced in the Senate by Senator Charles Hewitt of Locke, N Y, would amend sections 9, 16, 22-b, 25, adds new section 36-a, Mental Deficiency Law, relative to powers of commission providing for reimbursement for care of poor and indigent mental defectives and relative to penalty for certain violations

Referred to Finance Committee

STATE OF NEW YORK,  
No 778

Int 743

IN SENATE,

February 16, 1925

Introduced by Mr Hewitt—read twice and ordered printed, and when printed to be committed to the Committee on Finance.

**AN ACT\***

To amend the mental deficiency law, generally

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section nine of chapter six hundred and thirty-three of the laws of nineteen hundred and nineteen, entitled "An act in relation to mental defectives, constituting chapter seventy-one of the consolidated laws," is hereby amended to read as follows

§ 9 Official visits The commission, or a majority thereof, shall visit every state institution for mental defectives jointly or by a majority of the commission and every such private institution by one member of the commission or a duly accredited representative at least once in each calendar year

The commissioners shall at least once a year at a time to be appointed by the commission meet the managers of such state institutions, or as many of the number as practicable, in conference and consider in detail all questions of management and improvement of the institution, and they or one or more of them, with the managers, shall inspect the institution or such parts thereof as they deem necessary and they shall send to the managers in writing, if approved by a majority of the commissioners, such recommendations in regard to the management and improvement of the state institution as they may deem necessary or desirable All reports of inspections made by regularly accredited agents of the state board of charities and the fiscal supervisor's office, shall be reported in full to the commission for mental defectives

§ 2 Section sixteen of such chapter is hereby amended to read as follows

§ 16 Private institutions No mental defectives shall be cared for in a private institution unless such private institution shall be approved by the commission and shall have been given a license to conduct an institution for mental de-

fectives, and such private institution so licensed shall be under the supervision and subject to the rules and regulations of the commission *The violation of any provision of this section shall constitute a misdemeanor*

§ 3 Subdivision one of section twenty-two-b of such chapter, as added by chapter four hundred and eighty-three of the laws of nineteen hundred and twenty-one and last amended by chapter six hundred and fourteen of the laws of nineteen hundred and twenty-three, is hereby amended to read as follows

1 The institution now and heretofore known as the Eastern New York Reformatory at Nanpoch, with its grounds, buildings, materials, supplies, stocks and equipments, shall hereafter be under the supervision, control and direction of the commission for mental defectives and used for the care, training and treatment of mental defectives over sixteen years of age charged with, arraigned for or convicted of criminal offenses [The commission shall have, with respect to such institution, all the powers of boards of managers as prescribed in section nineteen of this chapter] The superintendent of purchase, as successor to the fiscal supervisor of state charities, shall continue to have fiscal supervision of such institution The commission, by order filed in its office of which a duplicate shall be filed in the office of the state comptroller, shall adopt a name for such institution, to be descriptive of its objects and purposes

§ 4 Section twenty-five of such chapter is hereby amended to read as follows

§ 25 Qualified examiners The certificate of mental defect must show that such person is mentally defective and may be made by two reputable physicians, graduates of an incorporated medical college, and duly licensed to practice medicine in the state of New York who have been in the actual practice of their profession at least three years, or by one such physician and one psychologist who shall have had two full years of post-graduate study in psychology at an incorporated university or college and three years of actual clinical experience Such examiners shall file with the commission for mental defectives a certified copy of the certificate of a judge of a court of record showing such qualifications in accordance with forms prescribed by such commission *The qualified medical examiners in lunacy shall be accepted as qualified examiners in mental defect*

§ 5 Such chapter is hereby amended by inserting therein a new section, to follow section thirty-six, to be section thirty-six-a, to read as follows

§ 36-a Reimbursement for care of poor and indigent mental defectives *The commission may, except as hereinafter provided, secure from the patient's estate and from relatives or friends who are liable or who may be willing to assume*

\* Matter in italics is new matter in brackets [ ] is old law to be omitted.

the costs of support of inmates of state institutions supported by the state, reimbursement at a rate fixed by the commission, in whole or in part, of the money thus expended, either directly or through the superintendents or treasurers of the respective state schools. The commission may, in its discretion waive the whole or a portion of the claim of the state for the cost of the support of a patient against the estate of such patient, whenever the court by which a committee was appointed shall have directed such committee to apply any part of the patient's estate for the maintenance of his family. The commission may appoint agents, whose duty it shall be to secure from relatives and friends who are liable therefor, or who may be willing to assume the cost of support of any inmate of a state school for mental defectives who is being supported by the state, reimbursement, in whole or in part, of the money so expended. The compensation of each agent shall be fixed by the commission on either an annual or per diem basis, provided that the annual compensation shall not exceed twenty-five hundred dollars, nor the per diem compensation eight dollars a day. Each agent shall receive his necessary traveling and other incidental expenses incurred by him, to be approved by the comptroller. The commission shall fix the rate to be paid for the support of an inmate of a state school for mental defectives by the committee of such inmate or by relatives liable for such support or by those not liable for such support, but willing to assume the cost thereof.

§ 6 This act shall take effect immediately

This bill is printed for the information of the members of the Society, and will be dropped

#### Appropriation of Clinic for Mental Diseases at Ossining Prison

Senate Int No 755 (conc Assembly Int 1018)—A bill introduced in the Senate by Senator Thos C Brown of Schenectady, N Y, concurrent Assembly Int No 1018, by Assemblyman Milan E Goodrich of Westchester County, would appropriate \$15,000 for a clinic for mental diseases in State prison at Ossining

Referred to Finance Committee

STATE OF NEW YORK,

Int 755

IN SENATE,

February 17, 1925

Introduced by Mr Brown—read once and referred to the Committee on Finance

#### AN ACT

To provide for the establishing of a clinic for mental diseases in the state prison at Ossining, and making an appropriation therefor

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 There shall be established in the

state prison at Ossining a clinic for mental diseases. The state superintendent of prisons shall appoint, and may at pleasure remove, and shall fix salaries of a psychiatrist to be in charge of such clinic, and such stenographic and clerical assistants as may be necessary for the conduct of such clinic. For the salary of such psychiatrist and for the personal service made necessary by this act, there is appropriated out of any money in the state treasury not otherwise appropriated the sum of fifteen thousand dollars (\$15,000). The moneys hereby appropriated shall be paid out on the warrant of the comptroller and the certificate of the superintendent of state prisons.

§ 2 This act shall take effect immediately

This bill is printed for the information of the members of the Society and will be dropped

#### Giving Health Commissioner Control State Hospital Crippled Children

Senate Int No 786 (conc Assembly Int 1074)—A bill introduced in the Senate by Senator Michael E Reiburn of New York, concurrent Assembly Int No 1074, by Assemblyman A Spencer Feld of New York, would add new article 19-a, Public Health Law, giving health commissioner control of State Hospital for Care of Crippled and Deformed Children at West Haverstraw

Referred to Public Health Committee of both Houses

STATE OF NEW YORK,

No 821

Int. 786

IN SENATE,

February 17, 1925

Introduced by Mr Reiburn—read twice and ordered printed, and when printed to be committed to the Committee on Public Health

#### AN ACT

To amend the public health law, in relation to the supervision and control by the state department of health of the New York state hospital for the care of crippled and deformed children

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended by inserting therein a new article, to be article nineteen-a, to read as follows

#### ARTICLE XIX-A

#### CONTROL AND SUPERVISION OF HOSPITAL FOR THE CARE OF CRIPPLED AND DEFORMED CHILDREN

- |             |  |
|-------------|--|
| Section 352 | Hospital continued                             |
| 352-a       | Board of trustees, supervision of commissioner |
| 352-b       | Fiscal control by commissioner                 |
| 352-c       | Expenditures                                   |

§ 352 Hospital continued The state hospital, known as the New York state hospital for the care of crippled and deformed children established at West Haverstraw, is hereby continued, but hereafter such hospital shall be under the general supervision and control of the commissioner of health

§ 352-a Board of trustees, supervision of commissioner The board of trustees of such hospital, as constituted pursuant to the provisions of article ten of the state charities law, is hereby continued with all the powers and duties conferred and imposed by such article, except as otherwise provided in this article, but the commissioner of health, in the exercise of the general supervision and control of such hospital, may prescribe that any and all of the powers and duties of such board be exercised and performed by such board in a manner to be approved by him

§ 352-b Fiscal control by commissioner The regulation, supervision and control of such hospital, in so far as the same pertains to expenditures of money, shall be vested in the state department of health No such expenditures or disbursements shall be made unless the same be authorized, audited and approved by the commissioner of health

§ 352-c Expenditures All balances of appropriations made for such hospital and remaining unexpended at the time this article takes effect shall be available and expended for the purposes for which such appropriations were made, but such moneys and all sums hereafter appropriated for such hospital shall be paid out by the treasurer on the warrant of the comptroller and the certificate of the commissioner of health All unexpended balances of gifts, legacies, bequests and other donations made to such hospital shall be expended for the objects and purposes for which the same were intended but hereafter such expenditures from such unexpended balances and from gifts, legacies, bequests or donations hereafter made shall require the approval of the commissioner of health

§ 2 This act shall take effect immediately

This bill is printed for the information of the members of the Society and will be dropped

**Giving Control of State Institute Malignant Disease to State Health Department**

Senate Int No 787 (conc Assembly Int 973)  
—A bill introduced in the Senate by Senator Michael E. Reiburn of New York, concurrent Assembly Int No 973, by Assemblyman Julius S. Berg of Bronx County, would amend section 345, Public Health Law, by giving State Health Department fiscal control of State Institute for Study of Malignant Disease

Referred to Public Health Committees of both Houses

No 822

Int 787

IN SENATE,

February 17, 1925

Introduced by Mr. Reiburn—read twice and ordered printed, and when printed to be committed to the Committee on Public Health

**AN ACT\***

To amend the public health law, in relation to the fiscal management of the state institute for the study of malignant disease

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section three hundred and forty-five of article eighteen of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," as added by chapter one hundred and twenty-eight of the laws of nineteen hundred and eleven, is hereby amended to read as follows

§ 345 Management and control, board of trustees The general management and control of said institute shall be vested in a board of trustees consisting of seven members, one of whom shall be the state commissioner of health, ex officio The remaining members shall, as often as the positions of the several original members constituted by the act of which this article is a part, become vacant, be appointed by and may be removed at the pleasure of the governor Said trustees shall serve without compensation, and said board shall meet quarterly and shall hold an annual meeting in November to receive the annual report of the director and to prepare for transmission to the legislature its report upon the work of the preceding year The board shall [audit the annual expenses of the institute and] appoint the director The board of trustees, *subject to the approval of the state commissioner of health*, shall, within the limits of the annual appropriation made therefor, fix all salaries of officers and employees of the institute [and authorize all disbursements] The board may meet any time on the call of the chairman and shall be allowed necessary traveling expenses in attending the fixed meetings or any special meetings At least two of the trustees shall be residents of Buffalo or vicinity and one of them shall be a member of the medical faculty or of the council of the university of Buffalo *The regulation, supervision and control of such institute, in so far as the same pertains to expenditures or disbursement of money, shall be vested in the state department of health No such expenditure or disbursement shall be made unless the same be*

\* Matter in *italics* is new matter in brackets [ ] is old law to be omitted

*authorized, audited and approved by the commissioner of health All unexpended balances of appropriations made for such institute shall be transferred to the state department of health and shall be available for and expended by such department in carrying out the objects and purposes for which such appropriations were made*

§ 2 This act shall take effect immediately

This bill is printed for the information of the members of the Society, and will be dropped

#### Bouton Chiropractic Bill

Senate Int No 789—A bill introduced in the Senate by Senator Arthur F Bouton of Roxbury, N Y, would define and regulate the practice of chiropractic

Referred to Public Health Committee

No 835

Int 789

IN SENATE,

February 18, 1925

Introduced by Mr Bouton—read twice and ordered printed, and when printed to be committed to the Committee on Public Health

#### AN ACT

To define and regulate the practice of chiropractic  
*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

#### Section 1 Definitions

- 2 The New York State Chiropractic Society, Incorporated
- 3 Board of examiners, organization
- 4 Powers of board
- 5 Present practitioners exempt from examination
- 6 Qualifications of applicants for examinations and license
- 7 Examination of applicants
- 8 Licenses
- 9 Waiver of examination
- 10 Registry of license
- 11 Display of license and evidence of registration
- 12 Rights of licensed practitioners
- 13 Revocations and cancellation of licenses
- 14 Proceeding for revocation
- 15 Compensation of examiners
- 16 Fines and penalties
- 17 Violations
- 18 Statutes repealed

Section 1 Definitions As used in this act, "Regents" means board of regents of the university of the state of New York "Society" means New York State Chiropractic Society, Incorporated

"Board" means the board of chiropractic examiners of the state of New York

"Chiropractic school" means any school, college or department of a university teaching and giving instructions in the subjects required for a proper chiropractic standard as herein defined, which schools, upon making proof of giving such teaching and instruction shall be registered and approved by the regents

"Proper chiropractic standard" means a course of study extending over a period of twenty-four months, during which an aggregate of at least two thousand one hundred hours of sixty minutes each of instruction is given in the following subjects Anatomy including histology and embryology, hygiene and sanitation including bacteriology, physiology, biological chemistry including dietetics, physical diagnosis and symptomatology, pathology, chiropractic analysis, and science and practice of chiropractic

"Practitioner" means one who practices chiropractic

"License" means a license granted and issued by the board of regents of the university of the state of New York under this act to practice chiropractic within this state

"Licensed practitioner" means one who has received a license and is entitled to practice chiropractic within this state under the provisions of this act

The practice of chiropractic is defined as follows A person practices chiropractic within the meaning of this act, who holds himself out as being able to locate and to adjust by hand misaligned or displaced vertebrae of the human spine, for the purpose of relieving nerve pressure caused thereby

§ 2 The society The New York State Chiropractic Society, Incorporated, is continued, and the officers thereof shall be entitled to hold offices until the expiration of their respective terms and the elections and qualification of their successors, but the existence of said society shall in no way affect the validity of this act

§ 3 Board of examiners, organization Within thirty days after this act takes effect, the regents shall appoint a board of examiners consisting of three members The term of office of such examiners shall be one for one year, one for two years and one for three years, the term of each to be designated in his certificate of appointment Before entering upon his term of office such examiner shall file with the secretary of state his oath of office The regents shall annually thereafter appoint one member of such board to fill vacancy caused by expiration of term and may at any time fill vacancies on the board Appointments to the first board of examiners by the regents shall be made from a list of ten candidates nominated by the society Be-

fore the day when the official term of a member of the board shall expire, the regents shall appoint his successor to serve for the term of three years. Such appointment shall be made from a list of five candidates nominated by the society after notice given by the regents to the secretary of the society, or in default of such nomination, from the licensed and registered chiropractors of the state. The regents in the same manner shall also fill vacancies in the board. After the board of examiners shall have issued ten licenses under the provisions of this act, no person shall be eligible for appointment as an examiner unless he be a duly licensed chiropractor. No person shall be appointed or permitted to hold the office of examiner who is an officer or employee of any school, college, or university. Cause being shown before them, the regents may remove an examiner from office on proven charges of misconduct, unfairness, incapacity or neglect of duty.

§ 4 Powers of the board. 1 The board shall organize by electing one of its members president and another member secretary thereof, any member of the board may administer oaths, summon witnesses and compel their attendance, and take testimony concerning any matter within the jurisdiction of the board.

2 The board of examiners shall, by a majority vote of its members subject to the approval of the regents, make such rules and regulations, not inconsistent with law, as may be necessary for the proper performance of its duties.

3 The board of examiners shall have charge of the preparation and grading of examination papers, and shall hold examinations in at least three places in the state during each calendar year.

4 The board shall, after a hearing, upon notice given, recommend to the regents the suspension or revocation of the license of a practitioner and the suspension or annulment of his registration, for any misrepresentation or false or fraudulent statement in his application or examination for a license, for his conviction of a crime involving moral turpitude or for a violation of any of the provisions of this act. Upon such recommendation being made the regents may suspend or revoke such license and may suspend or annul such registration. Whereupon the practitioner must surrender his license to the regents who shall certify the facts to the county clerk of each county in which the practitioner is registered.

5 The board may investigate violations of the provisions of this act and conduct hearings in respect thereto, when, in its discretion, it appears to be necessary, and to bring the same to the notice of any state or county official.

§ 5 Present practitioners exempt from examination. For the period of six months after the

appointment of the first board of examiners, upon application made in writing and the payment of a fee of ten dollars, the regents shall issue a license, without examination by the board of examiners, to such persons certified by the board of examiners to be more than twenty-one years of age, of good moral character and otherwise qualified in any one of the following: (a) Graduates after a resident course in a school teaching chiropractic who continuously during at least three years immediately preceding and at the time of taking effect of this act have been actually engaged in the practice of chiropractic in this state, and (b) graduates after a resident course in a school teaching chiropractic who have had a preliminary education equivalent to a high school course and who continuously during at least one year immediately preceding and at the time of taking effect of this act have been actually engaged in the practice of chiropractic in this state, and (c) applicants determined after examination conducted by the board to possess a working knowledge of the practice of chiropractic and to be qualified to pass an intelligence test equivalent to that required of a high school graduate and who continuously during at least two years immediately preceding and at the time of taking effect of this act have been actually engaged in the practice of chiropractic in this state.

§ 6 Qualifications of applicants for examinations and license. The board shall admit to the examination for license any applicant who shall have paid to the board of examiners an examination fee of twenty-five dollars and submitted satisfactory evidence verified by oath or affirmation that he possesses the following qualifications:

1 That he is more than twenty-one years of age, and

2 That he is a person of good moral character, and

3 That he has a preliminary education equivalent to graduation from a four year high school course registered by the regents, or an education accepted by the regents as fully equivalent, provided such course shall have included elementary biology, elementary physics, elementary chemistry as taught in secondary schools, and

4 That he has actually taken a resident course and graduated from a chiropractic school which maintained, during the time of his attendance, a resident course of study extending over a period of twenty-four months, during which course at least two thousand and one hundred hours of sixty minutes each of actual instructions were given, and which included in its curriculum substantially all of the subjects specified in the next section, provided, however, that the students who prior to the taking effect of this act were engaged

in a resident course of study in a school which was teaching chiropractic and which then maintained a course of study of at least two academic years of at least six months each, after graduation therefrom, and all graduate chiropractors who shall have been in active practice of their profession in this state prior to the passage of this act shall be deemed to possess an equivalent of the qualifications specified in this and the preceding subdivision and be eligible for examination

§ 7 Examination of applicants All applicants for examination for license shall be required to pass a written examination conducted in the English language in the following subjects Anatomy including histology and embryology, hygiene and sanitation including bacteriology, physiology, biological chemistry including dietetics, physical diagnosis and symptomatology, pathology, chiropractic analysis, and science and practice of chiropractic The board of examiners shall submit to the regents, as required, a list of questions for examination in the subjects enumerated From these lists the regents shall select questions for all the subjects To entitle the applicant to a license he must pass the examination with an average of seventy-five per centum

§ 8 Licenses On receiving from the board of examiners an official report that an applicant has successfully passed the examination and is recommended for license, the regents shall issue to him a license to practice chiropractic in this state Every license shall be issued by the regents under seal, and shall be signed by the president and secretary of the board of examiners and by an officer of the regents Before any license is issued, it shall be numbered and recorded in a book kept in the regents' office and its number shall be noted in the license This record shall be open to public inspection and in all legal proceedings shall have the same weight as evidence that is given to a record of conveyance of land Such license shall entitle the holder to use of the degree D C, or doctor of chiropractic

§ 9 Waiver of examination The regents may waive the examination of any applicant for license hereunder who presents satisfactory proof that he has been duly licensed as a practitioner in any other state of the United States, upon such waiver and the payments of the fee of twenty-five dollars the regents shall issue to him a license as provided in section eight of this act

§ 10 Registry of license Every licensed practitioner shall before beginning practice under his license, cause such license to be registered in the office of the clerk of the county in which his practice is to be principally carried on, in a book to be provided by the clerk for such purpose, in which shall be entered the name, residence, place and date of birth, number and date of license and an affidavit signed by such licensed practitioner

verified before such clerk to the effect that he is the person named in the license, and has complied with all of the provisions of this act The clerk shall indorse upon such certificate the date and his name, preceded by the words "registered to practice chiropractic, in the clerk's office of \_\_\_\_\_ county" The clerk shall

thereupon give to the licensed practitioner so registered a certified transcript under his official seal of the entries in the register The county clerk shall be paid a fee of one dollar for registration, affidavit and certificate If the registration of the practitioner be suspended or annulled by the agents, upon receipt of a certificate to that effect the clerk shall stamp upon the record of registry "registration suspended" or "registration annulled" as the case may be, with the date of suspension or annulment If such registration be thereafter reinstated the clerk shall note that fact on the registration record If a registered practitioner remove his office or maintain an office in another county he shall register also in such county and notify the board of such fact He shall present a transcript of registration and pay a fee of twenty-five cents, whereupon the clerk shall indorse thereon "registered also in \_\_\_\_\_ county"

§ 11 Display of license and evidence of registration Each licensed practitioner must at all times keep conspicuously displayed in his principal business office his license and registration certificate and in any office in which he practices chiropractic his county registration certificate. Every unrevoked license with indorsement of registry thereon shall be presumptive evidence in all courts and places that the person named therein is legally licensed and registered under the provisions of this act

§ 12 Rights of licensed practitioners Each duly licensed practitioner who shall have fully complied with all provisions of this act, shall have the right to practice chiropractic within this state and shall be subject to all the disabilities, limitations and restrictions and entitled to the civil rights, privileges and immunities imposed upon and granted to all professional persons by the civil practice act and the judiciary law A licensed chiropractor shall have the right to practice in public or private hospitals and other institutions in the state, when requested so to do by a patient or his natural and lawful guardian or representative or a member of his family

§ 13 Revocation and cancellation of licenses The regents may revoke the license of a practitioner or annul his registration, or both, in any of the following cases

(a) A practitioner who is guilty of any fraud or deceit in his practice, or who is guilty of a crime involving moral turpitude, or who is guilty of any fraud or deceit by which he was admitted to practice, or

(b) To an habitual drunkard or habitually addicted to the use of morphine, opium, cocaine, or other drugs having similar effect, or

(c) Who prescribes or administers drugs, or practices surgery or obstetrics, or

(d) Who undertakes to engage in any manner or by any ways or means whatsoever, to procure or perform any criminal abortion as the same is defined by section eighty of the penal law, or

(e) Who offers or undertakes by any manner or means to violate any of the provisions of section eleven hundred and forty-two of the penal law

§ 14 Proceeding for revocation Proceedings for revocation of a license or the annulment of registration shall be begun by filing a written charge or charges against the accused. Those charges may be preferred by any person or corporation, or the regents may on their own motion direct a member of the board of examiners to prefer said charges. Said charges shall be filed with the secretary of the board of examiners. The board of examiners shall hear and determine said charges. A time and place for the hearing of said charges shall be fixed by said board as soon as convenient, and a copy of the charges, together with a notice of the time and place when they will be heard and determined, shall be personally served upon the accused or his counsel, at least ten days before the date actually fixed for said hearing. Where personal service upon counsel cannot be effected, and such fact is certified on oath by any person duly authorized to make legal service, the board shall cause to be published, in the manner prescribed for the service by publication of a summons, a notice to the effect that at a definite time and place a hearing will be had for the purpose of hearing charges against the practitioner upon an application to revoke his license. At said hearing the accused shall have the right to cross-examine the witnesses against him and to produce witnesses in his defense, and to appear personally or by counsel. The said board shall make a written report of its findings and recommendations and the same shall be forthwith transmitted to the executive officer of the board of regents. If the said board shall find that said charges, or any of them are sustained, and shall recommend that the license of the accused be revoked or his registration be annulled, the regents may thereupon, in their discretion, revoke said license or annul said registration, or do both. If the regents annul such registration they shall forthwith transmit to the clerk of the county or counties in which said accused is registered as a practitioner, a certificate, under their seal certifying that such registration has been annulled and said clerk shall upon receipt of said certificate file the same and forthwith

mark said registration "annulled." Any person who shall practice chiropractic after his registration has been marked "annulled" shall be deemed to have practiced without registration. Where the license of any person has been revoked or his registration has been annulled as herein provided, the board may entertain an application for a new license, in like manner as original applications for licenses are entertained, and upon such new application they may, in their discretion, exempt the applicant from the necessity of undergoing any examination.

§ 15 Compensation of examiners Each member of the board of examiners shall receive a fee of fifteen dollars per day for each day necessarily engaged in the performance of his official duties and in addition thereto shall receive his necessary expenses while so engaged. The secretary shall receive, in addition to the fee of fifteen dollars and expenses above specified, the annual sum of one thousand dollars. The fees and compensation of the secretary shall not exceed in any year the sum of eighteen hundred dollars. The chairman of the board shall audit the expense account of each member, including his own, and certify the same to the regents.

§ 16 Fees and penalties All fees, fines, penalties and other moneys derived from the operation of this act shall be paid into the state treasury that the legislature shall annually appropriate for the department an amount sufficient to pay all proper expenses incurred by them in administering this act, including the salary and expenses of the board.

§ 17 Violations Any person who shall violate any of the provisions of this act shall be guilty of a misdemeanor. Any person not duly licensed under this act who engages in the practice of chiropractic shall be guilty of a misdemeanor.

§ 18 Statutes repealed All acts or parts of acts inconsistent with or contrary to the provisions of this enactment are hereby repealed.

§ 19 In effect This act shall take effect September first, nineteen hundred and twenty-five.

*Comment* This bill also is a cult bill and deserves the greatest opposition on the part of all those who hold the present sciences and their application in regard to health measures in behalf of the health of the public in due regard.

This bill is a special class legislative measure in behalf of the New York State Chiropractic Society, so that it would seem that this society, by its anxiety in introducing two bills, is desirous of controlling their type of cult practice to the exclusion of all others.

Careful perusal of the bill must be made by all and objections must be voiced to the committee on Public Health of the Senate, as from

the number of bills introduced relative to cult practice, it would seem that extreme efforts will be made this year to license those who have practiced medicine illegally, according to their own admission, before the state is awakened to what is necessary in the further protection of the public health

#### Delivery of Cadavers to Medical Colleges

Senate Int No 851 (conc Assembly Int 1027)  
—A bill introduced in the Senate by Senator John A. Karle of Queens County, concurrent Assembly Int No 1027, by Assemblyman Frank H. Lattin of Orleans County, would amend section 316, Public Health Law, relative to delivery of cadavers to medical colleges

Referred to Public Health Committees of both houses

Int 851

IN SENATE,

February 17, 1925

Introduced by Mr. Karle—read once and referred to the Committee on Public Health

#### AN ACT\*

To amend section three hundred and sixteen of the public health law, in relation to cadavers

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section three hundred and sixteen of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended to read as follows

§ 316 1 *Dissection* The persons having lawful control and management of any hospital, prison, reformatory, asylum, almshouse, morgue or other receptacle for corpses not interred, and every undertaker or other person having in his lawful possession any such corpse for keeping or burial may deliver and he is required to deliver, under the conditions specified in this section, every such corpse in their or his possession, charge, custody or control, not placed therein by relatives [or friends] in the usual manner for keeping or burial, to the medical colleges and universities of the state authorized by law to confer the degree of doctor of medicine and to all other colleges or schools incorporated under the laws of the state for the purpose of teaching medicine, anatomy or surgery to those on whom the degree of doctor of medicine has been conferred, and to any university of the state having a medical preparatory or medical post-graduate course of instruction [No corpse shall be so delivered or received if desired for interment by relatives or friends within forty-eight hours after death, or if known to have relatives or friends without the assent of such relatives or friends,

*or of a person who shall have expressed a desire in his last illness that his body be interred, but the same shall be buried in the usual manner. If the remains of any person so delivered or received shall be subsequently claimed by any relative or friend, they shall be given up to such relative or friend for interment.] No corpse shall be so delivered or received in case the next of kin, within forty-eight hours after death, notifies the person or institution so delivering or receiving the same, that it is desired for interment, or of a person who shall have expressed a desire in his last illness that his body be interred, and in such cases the same shall be buried in the usual manner.* Any person claiming any corpse or remains for interment as provided in this section, may be required by the persons, college, school or university or officer or agent thereof, in whose possession, charge or custody the same may be, to present an affidavit stating that he is such relative [or friend,] and the facts and circumstances upon which the claim that he is such relative [or friend] is based, and that the said relative assumes the cost of burial, the expense of which affidavit shall be paid by the persons requiring it. If such person shall refuse to make such affidavit, such corpse or remains shall not be delivered to him but he shall forfeit his claim and right to the same. Any such medical college, school, or university desiring to avail itself of the provisions of this section shall notify such persons having the control and management of the institutions and places heretofore specified, and such undertakers and other persons having any such corpse in their possession, custody or control in the county where such college, school or university is situated, and in any other county in the state in which no medical college, school or university is situated, or in which no such medical college, school or university desires to avail itself of the provisions of this section, of such desire, and thereafter all such persons shall notify the proper officers of such college, school or university whenever there is any corpse in their possession, custody or control, which may be delivered to a medical college, school or university under this section, and shall deliver the same to such college, school or university. If two or more medical colleges, schools or universities are entitled to receive corpses, under the provisions of this act and shall have given notice as aforesaid, they shall receive the same in proportion to the number of matriculated students in each college, school or university who are pursuing courses of anatomy and surgery at the time of making the apportionment. The professors and teachers in every college, school or university receiving any corpse under this section shall dispose of the remains thereof, after they have served the purposes of medical science and study,

\* Matter in italics is new matter in brackets [ ] is old law to be omitted

in accordance with the regulations of the local board of health where the college, school or university is situated. Every person neglecting to comply with or violating any provision of this section, shall forfeit to the local board of health where such non-compliance or violation occurred, the sum of twenty-five dollars for every such non-compliance or violation, to be sued for by the health officer of such place, and when recovered to be paid over, less the costs and expenses of the action, to such board for its use and benefits.

**2 Autopsies** The person having lawful control and management of any hospital in which a patient has died may order the performance of an autopsy upon the corpse, unless objection is made to such autopsy by the next of kin within forty-eight hours after death. In case of unclaimed bodies, the aforementioned medical colleges,

schools or universities shall have a priority claim to the bodies, for the purpose of teaching anatomy.

**3 Disposal of remains** In all cases in which an autopsy or dissection has been made of an unclaimed body, the provisions of article one hundred and ninety-eight of the penal law requiring the burial of a dead body and punishing interference with or injuries to it, shall apply equally to the remains of such body as soon as the lawful purposes of such autopsy or dissection have been accomplished, except that the persons having possession of the dead body may, in their discretion, cause it to be either buried or cremated, or may retain parts of such body for scientific purposes.

§ 2 This act shall take effect immediately.

No comment. The bill will be dropped.

## IN ASSEMBLY.

### Requiring Employers to Furnish First Aid in Factories

Assembly Int No 120—A bill introduced in the Assembly by Assemblyman Joseph Reich of Kings County, would add new section 213, Labor Law, requiring employers to furnish first aid service in factories, mercantile and other establishments.

Referred to Labor and Industry Committee.  
This bill will be dropped.

### Appointment of Physicians, Dentists and Nurses in Schools

Assembly Int No 127—A bill introduced in the Assembly by Assemblyman Joseph Reich of Kings County, would amend sections 570, 571, Education Law, by providing that boards of education and trustees shall appoint physicians and dentists and may employ nurses for service in schools.

Referred to Public Education Committee.

**Comment** This bill has been amended by adding at the end of the first paragraph "subject to the consent of the parents or guardians."

This change makes the bill less objectionable, but its provisions still are such as to keep it an undesirable measure although the consent of the parent or guardian is provided for it is quite evident that this would not work out in practice to give the family physician any more opportunity because the school physician would be in a position to bring pressure to bear upon the parents which would in a majority of instances result in the parents giving their consent to the school physician or nurse because they had sought it.

Medical men realize very keenly that medical and surgical attention to children when demanded, can rarely be completely administered without continuing the care of the child outside of the school hours, and if the school physician does not intend to follow the child to its home with his attention, and it is expected that the family physician shall supplement him, the situation produced would be undesirable to both physicians and often of a serious injury to the child.

### Practical Tests of Injured Persons

Assembly Int No 184 (conc Senate Int 647)—A bill introduced in the Assembly by Assemblyman F A Miller of Kings County, would amend section 118, Workmen's Compensation Law, by authorizing physical examinations and practical tests of claimants to determine loss of use and proportionate loss of use of a member, result and test to be part of record.

Referred to Labor and Industry Committee.

See concurrent Senate Int 647 for digest and comment.

### Nicoll Chiropractic Bill

Assembly Int No 185—A bill introduced in the Assembly by Assemblyman William Nicoll of Schenectady County, would define and regulate the practice of chiropractic.

Referred to Public Health Committee.

**Comment** It is to be hoped that the opposition to this vicious form of legislation has continued and will be kept up until absolute defeat of the bill is assured.

This bill has been amended from the old reading which was as follows:

"Sect 5 Present practitioners exempt from examination For the period of six months after the appointment of the additional member of the State Board of Medical Examiners as provided by this act "

and it now reads

"Sect 5 Present practitioners exempt from examination For the period of six months after this act takes effect, upon application made in writing and the payment of a fee of ten dollars, the regents shall issue a license, etc "

It will therefore be seen that another hole is punched in the provisions of the bill, opening the door still wider for the admission of practitioners without license and purely upon their "say-so" as to qualifications for practice

#### **Narcotic Bill**

Assembly Int No 215 (conc Senate Int 115)  
—See concurrent Senate Int 115 for digest and comment

#### **Providing Rate of Wages of Public Employees**

Assembly Int No 216 (conc Senate Int 116)  
—See concurrent Senate Int 116 for digest and comment

#### **County Supervisors for Children of Retarded Development**

Assembly Int No 229—A bill introduced in the Assembly by Assemblyman A Spencer Feld of New York County, would add new section 579-a, Education Law, providing for county supervisors to supervise education of children with retarded development

Referred to Public Education Committee

No further comment

#### **Inspection of Children Institutions**

Assembly Int No 236 (conc Senate Int 228)  
—See concurrent Senate Int 228 for printed bill and comment

#### **Free Choice of Physician**

Assembly Int No 301 (conc Senate Int 594)  
—A bill introduced in the Assembly by Assemblyman Frank H Lattin of Orleans County, would amend section 13, Workmen's Compensation Law, by permitting injured employees at employer's expense, to engage medical or other attendance

Referred to Labor and Industry Committee

See concurrent Senate bill and Int 594 for digest and comment

#### **The State Department of Education Bill Amending the Medical Practice Act**

Assembly Int No 307 (conc Senate Int 211)  
—See concurrent Senate Int 211 for digest and comment

#### **County Public Health Nurses**

Assembly Int No 399 (conc Senate Int 283)  
—See concurrent Senate Int 283 for digest and comment

#### **Disclosure of Confidential Communications**

Assembly Int 422—A bill introduced in the Assembly by Assemblyman Samuel Rosenman of New York County would amend section 352, Civil Practice Act, by providing physicians and nurses may disclose professional information as witnesses in action to annul marriage on ground of fraud

Referred to Codes Committee

*Comment* It is again asked if the County Chairmen have written to the Assembly Codes Committee as requested in opposition to the bill

#### **Free Choice of Physician**

Assembly Int 570 (conc. Senate Int. 380)—  
See concurrent Senate Int 389, for digest and comment

#### **Esmond Chiropractic Bill**

Assembly Int 649—A bill introduced in the Assembly by Assemblyman Burton D Esmond of Saratoga County would amend sections 164, 169, 170, 173, adding new article 8-b, Public Health Law, relative to the practice of medicine, and to chiropractic

Referred to Public Health Committee.

*Comment* Attention of the members of the Medical Society is called to the fact that this chiropractic bill reads almost word for word the same as the Department of Education bill amending the Medical Practice Act (Senate Int. 211, conc A 307), and omits the sections which are obnoxious to chiropractors and adds on sections which would permit of their practicing through the legal verbiage added on

Extreme caution and precise care must be used by each county legislative chairman and individual in discussing medical and chiropractic legislation that these two bills may not be confused, as is evidently the intent, and in drawing this chiropractic bill in such a manner to befog the mind of the legislator when ultimate voting comes up

#### **Health Service in Schools**

Assembly Int 748 (conc Senate Int 302)—  
See concurrent Senate Int 302 for digest and comment

#### **Inspection of School Children**

Assembly Int 850 (conc Senate Int. 586)—  
See concurrent Senate Int. 586 for digest and bill printed

#### **Physically Handicapped Persons**

Assembly Int 868 (conc Senate Int 671)—  
See concurrent Senate Int 671 for digest and printed bill

**Forbidding Sale of Wood or Methyl Alcohol Except as Methanol**

Assembly Int 908—A bill introduced in the Assembly by Assemblyman Frank H Lattin of Orleans County, would add new sections 416, 447, 447-a, Penal Law, forbidding sale of wood or methyl alcohol except as methanol, and making it a felony to sell food or drink or medicinal or toilet preparations for internal use in which there is methanol

Referred to Codes Committee

*Comment* No further comment

**Reciprocity in License to Practice Medicine**

Assembly Int 925—A bill introduced in the Assembly by Assemblyman Edward J Coughlin of Brooklyn, N Y, would amend section 169, Public Health Law, relative to licenses to practice medicine who have received the licensee in another state

Referred to Public Health Committee

No further comment as yet

**Rural Hygiene**

Assembly Int No 969—(conc Senate Int 716)—See concurrent Senate Int 716 for digest

**Control of State Institute for Malignant Disease by State Department of Health**

Assembly Int No 973 (conc Senate Int 787)—A bill introduced in the Assembly by Assemblyman Julius S Berg of Bronx County, would amend section 345, Public Health Law, by giving State Health Department fiscal control of State Institute for Study of Malignant Disease

Referred to Ways and Means Committee.

See concurrent Senate Int 787 for digest and comment

**Dissection of Dead Bodies**

Assembly Int No 986 (conc Senate Int 681)—See concurrent Senate Int. 681 for digest

**The Birth Control Bill**

Assembly Int 987—A bill introduced in the Assembly by Assemblyman John Boyle, Jr, of Suffolk County, would amend section 1145, Penal Law, by permitting use of instruments for contraceptive treatment of married persons

Referred to Codes Committee

No 1041

Int 987

IN ASSEMBLY,

February 16, 1925

Introduced by Mr Boyle—read once and referred to the Committee on Codes

**AN ACT\***

To amend the penal law in relation to physician's instruments

\* Matter in *italics* is new matter in brackets [ ] is old law to be omitted

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section eleven hundred and forty-five of the penal law is hereby amended to read as follows

§ 1145 Physician's instruments An article or instrument, used or applied by physicians lawfully practicing, or by their direction or prescription, for the contraceptive treatment of married persons or for the cure or prevention of disease, is not an article of indecent or immoral nature or use, within this article The supplying of such articles to such physicians or by their direction or prescription, is not an offense under this article

§ 2 This act shall take effect immediately

*Comment* Why this bill should recur year after year is a question which interests the medical profession and those who believe in the dictates of a Divine Being

The bill is useless if it is for practical purposes since the law is being controverted quietly by many and moreover it is detrimental to the best interests and welfare of the inhabitants of this State Such a question has long since been passed upon as not moral and harmful to unknown degrees

Those who are in favor of it advance time worn and hackneyed argument but your Committee on Legislation urges the county chairman to register their disapproval to the measure

Assembly Int No 1005 (conc Senate Int 743)—See concurrent Senate Int 743 for digest and comment

**Providing That Those Using Laboratory Supplies Shall Furnish Clinical Data, Etc.**

Assembly Int No 1167—A bill introduced in the Assembly by Assemblyman Frank H Lattin of Orleans County, would amend section 5, Public Health Law, by providing institutions and persons using laboratory supplies shall furnish clinical data and report or pay market prices and fees therefor

Referred to Public Health Committee

Int No 1167

IN ASSEMBLY,

AN ACT\*

Introduced by Mr Lattin to amend the public health law, in relation to district laboratory supply stations

Section 1 Section five of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," as added by chapter six hundred and

\* Matter in *italics* is new matter in brackets [ ] is old law to be omitted

twenty of the laws of nineteen hundred and twenty and last amended by chapter six hundred and thirty-seven of the laws of nineteen hundred and twenty-three, is hereby amended to read as follows

§ 5 LABORATORY SUPPLY STATIONS The state commissioner of health or his authorized representative may establish stations, to be known as district laboratory supply stations, for the distribution of laboratory supplies furnished by the state department of health *Institutions, physicians and all other persons using these supplies shall furnish the clinical data and reports required by the laboratory of the state department of health and laboratories approved by the commissioner of health, or pay the market prices and fees for such laboratory services and supplies as shall be established from time to time by the state commissioner of health All such fees and charges made by the laboratory of the state department of health shall be paid into the state treasury [He] The state commissioner of health may designate districts to be served by [such] the district laboratory supply stations (remainder same as old law)*

§ 2 This act shall take effect immediately

*Comment* This would write into the law possibly under the rules and regulations to be devised, the divulging of confidential communications between patient and physician as well as to open the liability to penalty in case the information could not be furnished in full as would be required by the law Immediate comment is requested from the County Legislative Chairmen. # State Department of Health

## COUNTY JUDGE JUSTIFIES MENTAL EXAMINATION OF CRIMINALS.

At the December term of the Greene County Court, Judge William E Thorpe's disposition of ten criminal cases was one which should be of especial interest to members of the medical profession

Judge Thorpe directed the district attorney to call in Dr C P McCord, a psychiatrist of Albany, to make a mental examination of each of the ten defendants. This was done in the presence of the court. Considerable adverse criticism developed, chiefly because of the expense involved. In a statement issued subsequently, Judge Thorpe said

"Having been present at each one of these examinations, having carefully noted the degree of detail and the numerous branches of medical, mental and psychological research adopted by the expert, it was readily apparent to me, and demonstrated beyond the peradventure of any doubt, that without this examination there would have been one of the most serious and regrettable dispositions of each of these cases that had ever happened within the confines of a County Court in this County"

\* \* \* \* \*

"If we went to the doctor's office and informed him that one of the members of our family was ill, and he should respond by saying 'Give him a dose of paregoric,' we would consider the doctor was either grossly negligent, unwilling to perform the duties of the position he occupied in society, or lacking in sound common sense and good judgment. Yet, on the other hand, the tax-paying public are asking the judicial officers before whom criminals are arraigned and who have the power of disposition as to their future, to not diagnose the disease but to furnish the remedy for a disease that they do not know the character of and which in instances of this kind there can be but one remedy for, and that is reformatory or prison. The assuinity of such a method of performance is clearly apparent when we wouldn't have a doctor treat without *any*

diagnosis. On the one hand, it is the health of the individual that will be affected, while on the other hand, where the judge enters into the situation, it means the future of the criminal and his relation to society, and the peace and harmony of the society in which he shall later mingle, all of which are in the hands of the judicial officer, and the public have heretofore demanded or expected disposition of these cases on his part without any knowledge of the disease"

\* \* \* \* \*

"The procedure adopted here in Greene County perhaps is among the first, if not the first adopted in any Court of this kind in the entire United States, particularly true, perhaps as to New York State, but it has been recommended a long time since by the American Bar Association, and prominent criminal lawyers all over the country are repeatedly rallying to the standard whose insignia is no longer 'An eye for an eye and a tooth for a tooth,' but is rather that justice shall be tempered with mercy, and that no prescription shall be given in the way of a sentence until the disease calling for the prescription shall have been thoroughly diagnosed and a perfect analization made so that there may be chance of a recovery or at least full protection to society from the future crimes of these same individuals"

\* \* \* \* \*

"While the first expense incurred for examinations of this kind may seem large, I feel sure in saying that this expense which saves the criminal to society is infinitesimal as compared with the expense that the taxpayers will incur in taking care of him and his progeny after he shall have been treated *without* diagnosis, committed to an institution, permitted to associate with criminals, absorbing their ideas and their suggestions, and allowed to propagate and bring up offspring which shall become a menace to society and a disgrace to civilization generally"

## MONROE COUNTY HEALTH COMMITTEE ADOPTS NEW PROGRAM

The County Health Committee of the Tuberculosis and Public Health Association of Rochester and Monroe County has adopted the following health program

1 The extension of nursing service and the promotion of pre-school health examinations, with the assistance of Sheppard-Towner Funds

2 Demonstrations of the Nutrition Class in

certain towns where request for this service is made

3 A close cooperation with the Monroe County Tuberculosis Sanatorium, and all agencies here present, in order that our combined work may attain maximum effectiveness in health

4 A consideration of the individual problems of each community, so far as is possible, com-

bined with the offer of the Association's facilities in solving them

5 The extension of health education from every angle

6 The examination for tuberculosis of high school pupils and others who are leaving school for work

7 The endorsement of the campaign for the eradication of bovine tuberculosis now being conducted by the Monroe County Farm Bureau

8 The distribution of these resolutions to all agencies participating in this conference

9 The promotion of health examinations for adults by local physicians

## THE PROGRESS AND PRESENT STATE OF MEDICINE—IN 1792

Officers and other members of the County Medical Societies will be interested to read a quotation given below, from a pamphlet in the State Library, entitled "The Rise, Progress and Present State of Medicine"—a discourse delivered before the Middlesex Medical Association by Dr Benjamin Waterhouse, in 1792. Middlesex County includes Cambridge, Massachusetts, where Dr Waterhouse was Professor of the Theory and Practice of Medicine. It will be remembered that it was he who first introduced into America the Jennerian method of vaccination against smallpox.

As an introduction to the "Discourse," there is printed an abstract from the Constitution of the Middlesex Medical Association, and then there appears the following

Queries put to each Member at the opening of every meeting

1 Have you met with anything in any medical

author, since our last meeting, suitable to be communicated to this association?

2 What was the last epidemic that visited the district where you reside, and what were its remedies particularly serviceable in it?

3 Do you know of any instance, since our last meeting, of the resuscitation of any one apparently dead, and the method pursued?

4 Is there any difficult point in the theory or practice of physic, which you would gladly have discussed at this time?

5 Do you know of any deserving beginner in the practice of physic, too young to become a member, whom this association can in any way serve or encourage?

6 Have you any weighty affair in hand as a physician, in which you think the advice of this association may be of service?

7 Do you think of anything at present in which this association may be of service to mankind, to their country, or to themselves?

## ANOTHER TYPHOID CARRIER DISCOVERED

Recently in one of the cities of the State a case of typhoid fever in a child three years of age was investigated. It was suggested to the attending physician that the cook in the household might be a carrier. This cook, who is 60 years old, had previously denied a history of typhoid fever, but evidently had misunderstood the questions, as she had inferred that they applied to the immediate past. Later she admitted that she had typhoid fever about 35 or 40 years ago.

The attending physician had been somewhat misled by the first history and by the fact that two previous occupants of the house had had the disease, so that he was inclined to attribute the source to house infection due to defective

plumbing. However, at the suggestion of the district state health officer, fecal specimens from the cook were examined. The results proved her to be a carrier.

This experience illustrates the futility of as signing defective plumbing or the like as the source of infection, which, of course, must originally have come from a patient or carrier. It also illustrates the need of very careful inquiry before concluding that a suspected carrier has not had typhoid fever. In this connection it may be noted that it is not uncommon to find that a suspect who reveals no history of typhoid fever, even on the most careful questioning, proves to be a carrier.

## REMOVAL OF TONSILS CURES DIPHTHERIA CARRIERS

As a result of a small outbreak of diphtheria in one of the Granville Schools, a number of pupils became diphtheria carriers, some of these being contacts and others recovered clinical cases.

At the instigation of Dr D. C. McKenzie, Health Officer of Granville, eleven of these carriers attended a clinic in Granville on November 10, and had their tonsils and adenoids re-

moved. Of the eleven, four had had clinical diphtheria, three of the four gave positive cultures for nine weeks, and the remaining one for twelve weeks.

Eleven days after the operation, cultures for release were taken with negative results in all cases. Second cultures taken from all the carriers two days later were also negative, and the children were released from quarantine.

# Medical Society of the State of New York

## REFERENDUM ON THE MEDICAL PRACTICE ACT

The members of the Medical Society of the State of New York have had an opportunity to read and consider the proposed Practice of Medicine bill which was introduced in the Senate on January 20, 1925, and was printed on page 123 of the January 30 issue of this Journal

This bill is essentially the same as the bill which was introduced in the Senate on February 11, 1924, and which was printed on page 214 of the February 22, 1924 issue of this Journal. However, this year's bill embodies a few changes which clarify some of the provisions of the former bill

On March 4th the Committees of the Senate and Assembly will hold a hearing on all the bills relating to the practice of medicine. Specifically the bills to be considered are the Practice of Medicine bill, the Drugless Therapy bill, and the two bills legalizing chiropractic practice

The unanimous desire of the physicians of New York State for the enactment of the bill would be considered by the legislators to have great weight in their decisions. Unfortunately there is some opposition which appears to be largely sectional, and therefore the Council of the Medical Society of the State of New York at its meeting on February 18, authorized a referendum vote of the members of the House of Delegates. The ballot is in the following form

### MEDICAL SOCIETY OF THE STATE OF NEW YORK

WHEREAS, There has been introduced in the Senate by Mr. Karle a bill, introductory number 211, see Journal, January 30th, 1925, page 123, entitled "An Act to Amend the Public Health Law in relation to the practice of medicine" and a similar Act by Mr. Dunmore in the Assembly, known as introductory number 307, and a hearing on these bills is to be held in the Assembly Chamber, before a joint committee on Public Health, of the Senate and the Assembly, on March 4, 1925, and

WHEREAS, These bills are sponsored by the Department of Education of the State of New York and provide for amendments to the Medical Practice Act, providing for an accurate official list of licensed physicians by means of annual registration, the clarifying of the exemptions of different classes of persons under the Act so as to limit such exemptions and make the Act more effective, providing for adequate, civil and criminal penalties for the practice of medicine by the

unlicensed practitioners, prohibiting the use of the title "Doctor" by those not legally entitled to the same, curtailing improper medical advertisements, providing for recovery of damages against unlicensed practitioners for injury to those treated by them, simplifying the procedure for revocation and annulment of registration of physicians, and providing for state wide inspection and prosecution of illegal practitioners, and

WHEREAS, That at the hearing on March 4, 1925, by the Joint Committee, it is desirable that the Medical Society of the State of New York should officially record its position on said measures

*Therefore, Be It Resolved*, That the Council hereby approves said measures and recommends the passage of the same subject to a favorable referendum vote of the House of Delegates of the Medical Society of the State of New York confirming said action

*Further Resolved*, That pursuant to Section 24 of the By-Laws of the Medical Society of the State of New York, a referendum vote of the said House of Delegates be, and is hereby ordered, and said vote shall be completed by mail on or before the 5th day of March, 1925, and that the question submitted for such vote shall be as follows

The Medical Society of the State of New York hereby endorses the said Karle and Dunmore bills and urges their passage by the Legislature

Vote by marking X in blank space

Yes ☐ No ☐

Signed, Officer or Chairman, Standing Committee, or Delegate from County of the Medical Society of the State of New York

\*Note A majority vote before March 4th is necessary to be of any value. *Vote and return at once to the Secretary*

New York City, February 18, 1925

By order of the Council Edward Livingston Hunt, Secretary

A copy of this ballot has been sent to every member of the House of Delegates

There is need that the members send their votes immediately in order that the results may be available for presentation at the legislative hearing

# NEWS NOTES

## OCCUPATIONAL HAZARDS IN PERIODIC HEALTH EXAMINATIONS

By LOUIS I HARRIS, M D,  
NEW YORK

Abstract of the fifteenth lecture in the Symposium on Periodic Health Examinations conducted by the Medical Society of the County of New York, given January 29, 1925

Occupations often have definite effects on the health of workmen. Those who practice industrial medicine are trained to recognize the early signs of occupational diseases and to guard against their development into crippling conditions. The subject is exceedingly broad. I will point out only a few of the more evident conditions which are likely to come to the attention of any physician who makes periodic health examinations, and will consider some of the more common pre-clinical symptoms of disorders due to occupations.

*Eyes*—1 The eye is an organ which is often affected by occupational conditions. This is because of the strains from poor lighting and from unusual positions. A typical example is the nystagmus of miners which develops from poor lighting and from the miner working in an unnatural posture.

2 Those who work in excessively hot places, such as foundries and boiler-rooms, are sometimes subject to cataract due to the heat.

3 Dimness of vision may be due to the scars which are the result of flying pieces of metal or stone in the process of grinding or surfacing. The danger to vision from this cause is indicated by the frosting of the protective glasses worn by stone workers after a few hours of labor.

*Nervous and Mental Conditions*—1 Fatigue produces far-reaching mental and nervous conditions, among them being mental irritability, liability to accidents, and decreased output of product.

2 The constant use of a set of muscles may produce painful conditions, such as the cramps of writers and typists. Three elements leading to fatigue are hurry, piece-work, and the constant repetition of a monotonous motion.

3 Nervous conditions are often found among highly skilled workmen, such as goldsmiths and engravers, who are under mental strain and feel a keen responsibility for valuable products.

Poisoning by substances used in industries is common and may produce nervous symptoms. We will discuss only a few of these.

a Mercury poisoning often occurs in hat-making and the fur industry. The earliest signs

are usually irritability known as erethism, a slight tremor, or spongy gums and ptyalism.

b Carbon bisulphide, which is largely used in the rubber industry and for extracting oils from seeds or degreasing, produces headache which is felt at the root of the nose and spreads to the temples or appears at the vertex and radiates to the shoulders.

c Headache is also one of the earliest signs of lead poisoning. Paralysis is usually a late sign of fully developed poisoning by lead.

d Carbon monoxide poisoning is becoming increasingly common owing to the exhaust automobile gases. Its first manifestation is usually headache. It often produces anemia in those who are subject to mild poisoning day after day.

*Skin and Color*—1 The skin is often affected by some of the chemicals introduced into modern industrial processes. Jaundice may result from handling and from the tetra-chlorethane used to varnish airplane wings. The jaundice is due to the destruction of red blood cells.

2 Eczema is an early sign of local poisoning by various irritating chemicals, such as turpentine and aniline. It frequently follows the use of paraphenylenediamine which has lately been introduced into hair-dyes.

3 Ulcers and boils are often produced by the local action of arsenic, mercury, hydrofluoric acid, and chromic acid. Perforation of the nasal septum is a peculiar result of chromic acid derivatives.

*Nose and Throat*—The nose and throat are often seriously affected by fumes and dusts.

Noise which is intense and long continued often dulls the hearing to the point of deafness. Over half of the workmen in one establishment were made deaf by the excessive noise of machinery.

This is but an introduction to points that should be kept in mind in making a routine periodic health examination. Time does not permit of the completion of the pre-clinical conditions that are frequently encountered in the examination of those employed in industry.

## MEDICAL SOCIETY OF THE COUNTY OF KINGS

The following report of the Legislative Committee of the Medical Society of the County of Kings was unanimously accepted at the Stated Meeting of the Society held on February 17, 1925. It was moved, seconded and carried that a copy of the report be transmitted to all the County Societies in the State of New York, and also that a copy of the report be sent to the NEW YORK STATE JOURNAL OF MEDICINE for publication.

Ten days after the January meeting of the Medical Society of the County of Kings your Legislative Committee held a meeting to consider the 1925 Medical Practice Act, sponsored by the State Department of Education, and known as the Karle-Dunmore Bill, Senate Introductory 211, Assembly Introductory 307.

Pursuant to the request of the Society, the Committee was advised by counsel for the Society, Judge John G. Dyer.

Judge Dyer took up with the Committee a calm, cold analysis of the new matter in the bill line by line. After the Judge had finished his analysis a lengthy discussion was entered into by the Committee. The good points in the bill were brought out. The reasons why we might support the bill are as follows:

1 In union (with the State Society) there is strength.

2 The penalties imposed would have a healthful effect on illegal practitioners.

3 Under existing law the work of the Committee on Illegal Practice of the Medical Society of the County of Kings is voluntary and might not always function. Also, the activity of the District Attorney of Kings County is exceptional.

4 The added protection to the title of "Doctor" is good.

5 The State Department of Education would have what it wants, viz., a check-up on all doctors practising today.

The objections to the bill are as follows:

1 We are opposed to registration in principle. The principle of law applying in dentistry and podiatry is as follows:

"Any dentist (nurse, optometrist, or podiatrist—Pars 199 and 201, 251-a, 278-a, 304, of the

Public Health Law) whose name does not appear in the registry on or before the first of January of each year may have his license revoked or suspended by the State Board of Regents."

While the Karle-Dunmore Bill does not contain this provision, it could all too easily be amended after registration was once a law—as has occurred in the case of the nurses and podiatrists.

2 Section 170-d, which has to do with the use of contraceptive measures, should be restored to the bill.

3 The penalties are objectionable, too severe, give arbitrary power, and in our opinion, are for contumacy only.

4 The bill is unnecessary, unremedial, uncalled for. Our present laws are sufficient. We should go slowly about any change in the Medical Practice Act as physicians in general are not acquainted with such proposed changes.

5 We should reject anything covered by existing law. We believe we would be making more laws without enforcing the present ones.

6 While calling for registration of all honest physicians with payment of a fee, etc., for five years, and then registering annually for the rest of our natural lives without payment of a fee, it does not register cults.

7 We believe the public health is better protected today than ever before. This bill empowers the attorney-general to deprive the district attorney of the right to prosecute—an unwarranted centralization of power.

8 We have a vested interest in our state license as practitioners of medicine which should not be jeopardized by even the color of discretionary power.

9 In our opinion, this bill would be an entering wedge for compulsory health insurance and other forms of State Medicine.

10 The only good that might presumably be obtained now would be to prosecute cults at the cost of great personal inconvenience.

About midnight your Committee cast one vote in unanimous opposition to the Karle-Dunmore Bill.

(signed) JOSEPH A. DRISCOLL, M.D.,  
Chairman, Legislative Committee

# THE DAILY PRESS

Oysters and typhoid are occupying less and less of the space in the daily papers, and yet the most important part of the situation is just starting, and that is the constructive remedy. The *Elmira Advertiser*, February 1, says editorially:

"Dealers are coming to understand that they must bring their business up to a standard approaching that followed by the meat industry of the country. It was learned, many years ago, that a number of diseases may be carried and distributed through the careless handling of food products, and pretty nearly everything from lemons to sides of beef are fairly well protected, although in instances, carelessness will creep in. Oysters should be handled with as much care as milk, and the source of supply should be as carefully inspected, graded and scored, as are the dairies of the country, which furnish milk to cities and towns. But it has not been done, if reports of investigations are to be believed, and so the reckoning had to come. The oyster industry has been hard hit for a season, and the country has been deprived of an excellent food."

"Results have already been realized, and improvements must continue in the future. The state of New York has also something to do along this line. There are extensive oyster beds along the shores of Long Island."

In line with this optimism has been the action of some of the Boards of Health on the South Shore of Long Island where a great quantity of some of the finest oysters in the land are grown. The co-operative attitude of the local Boards of Health and people was publicly commended by State Commissioner of Health at a recent hearing on the sewage pollution of oyster grounds. This desire to construct sanitary sewer systems is reflected in the *Patchogue Advance* of February 19, which describes the action of the Village Board on February 17, when its members unanimously voted to take a radical step to secure the immediate formation of a sewer district and the construction of a disposal plant. The account reads:

"At a special meeting of the village board Tuesday night the sewer question was discussed at length in executive session behind closed doors, and while various ideas were put forth as to how best to handle the sewer question and what the possibilities are for passing a sewer proposition if the board offers one, it was decided that something must be done, and in order to have as wide scope for action as possible it was agreed to seek an amendment to the law which would permit forming a small sewer district within the village, which could have the use

of and stand the cost of a mere uptown sewer at first."

"This follows the idea outlined at the State Health Commissioner's hearing. The board directed its counsel to go to Albany and work out such a bill. Such a district, if authorized, might, as a minimum temporary expedient to meet the State's demand for purification of the river and bay, establish a disposal plant and take over the present private sewer. Or it might lay the first unit of a comprehensive system. There is a heavy demand for the commencement of a real general sewer system."

The law to which reference is made is that part of the Village Law relating to the formation of sewer districts and the construction of sewers. The present law has two difficult requirements, first, that before a public sewer can be constructed in a village, a comprehensive plan for a sewer for the *entire* village must be made, and second, the plan must be submitted to a vote of the taxpayers of the entire village. If it is adopted, the Village Board may construct any part of the system that may be needed.

Patchogue needs a sewer in only that small area which is occupied by the congested business blocks. The owners of the block are willing and anxious to form a sewer district, but the great mass of taxpayers living outside that area have no immediate need of a sewer and have voted down the sewer proposition.

The law which is proposed would be a *general* law applying to any village. It would be *permissive*, and would allow the residents of a small area to form a sewer district by petition, as the Town Law permits the residents of a small community of a town to do. The passage of such a law will lead at once to the abatement of greatest source of pollution of the oyster grounds, as well as be of great benefit to the people of several villages.

The *Newburgh News* of February 11 contains a report of the Health Officer regarding the prevalence of communicable diseases and says:

"That there is an improvement in the local situation as regards both diphtheria and scarlet fever is indicated by the fact that from January 19 to January 24 inclusive eight cases of diphtheria were reported, as compared with three cases from February 1 to February 9. From January 1 to January 10 inclusive twenty-one cases of scarlet fever were reported, as compared with eleven during the first nine days in Febru-

ary Dr Burke says the danger is not yet over, and that parents should use every precaution against exposing their children to any possible indirect contact with either disease, and to segregate children suffering from either

"The situation here at no time approached an epidemic, although the number of cases of scarlet fever reported during January was sixty-nine"

Reading between the lines, it would seem that there has been an excess of scarlet fever cases in the city and that the cause is largely the indifference or ignorance of the people themselves. One familiar with epidemics knows that people generally expect that scarlet fever comes plainly labeled, and believe that, if a child has only a little sore throat and nausea and a slight transient redness of the skin, the case is not scarlet fever, it is not kept from school, and is not reported to the health officer

The school authorities working with the compulsory education law, have efficient machinery for discovering and controlling cases. The principle is to *account for every child every day*. This requires the co-operation of the health officer, the school teachers, the school medical inspector, and the parents of the children, and the time to institute such a system is at the beginning of the epidemic

The Patchogue *Advance*, February 19, contains an account of the adoption of the principle at the beginning of an outbreak, and says

"Some children were found slightly ill over the week-end and on Monday, and by Monday afternoon a plan of action had been established which included the inspection of every pupil in the schools daily, and the sending of a warning and informative circulars to every pupil's home. They were mailed out promptly and reached the people on Tuesday"

The following circular was prepared by the health officer and a copy was given to every pupil to take home

"The officers of the schools of Patchogue are trying to find the cases of scarlet fever from which several children have caught the disease. They will see, or hear from, every child every day

"Be sure to send your child to school, for there the medical inspector, the nurse, and the teachers will observe it. If any child shows signs of sickness, it will be sent home before it can do harm to others. School is the safest place in which your child can be

"Look for signs of scarlet fever in your child before you send it to school. The signs are those

of a cold or sore throat, with some loss of appetite or vomiting

"If your child appears to be sick in any way, send for your doctor, or you may telephone to the school nurse (Telephone, Patchogue 800) and a doctor or nurse will come to your house without cost to you

"If you keep your child home from any cause, a school officer will call you up to see if the child is sick

"Some children have had scarlet fever, and their skins are now peeling. These children will be kept out of school until they are well

"It is up to parents to help the school officers to find the mild cases of scarlet fever that are dangerous to well children"

The method adopted was that every pupil who comes to school is inspected carefully daily for signs of beginning sickness, and that the health teacher and two assistants check up on the absentees by home visits or telephone

The result is that every child with a sore throat is discovered and isolated until the nature of the disease is determined

The happy result of the system is that parents feel safe in sending their children to school, absences are few, and the epidemic is aborted

Some parents think there has been unnecessary expense and publicity, but the great majority of the people heartily approve the action of the officials of the school and the health department

---

The Avon *Herald*, February 12, contains a column description of a child welfare clinic conducted in Avon with the co-operation of the State Department of Health. The description was written by Dr George W Squires, a local physician, whom we quote

"At the pre-school age clinic recently held at the Legion Room the importance of the activities and services of the Iowa nurse, Miss Wirth was demonstrated. She was an absolute necessity and some appreciation of her services to the community understood

"Mrs W Schanck, chairman of the Child Welfare Board of the county, spent time and valuable assistance toward the success of the clinic. Dr Zilmer and Dr Dean with Mrs White, experts in children's diseases, pleased both parents and children in the tact and interest they showed with little patients and mothers

"Those of the visiting public who comprehended the value and privilege of these State Clinics and "went and saw," are unanimous in their appreciation and zeal for the success of their efforts"

# BOOK REVIEWS

**HOSPITAL ORGANIZATION AND OPERATION** By FRANK E CHAPMAN Octavo of 270 pages with illustrations New York, The Macmillan Company, 1924 Cloth, \$3.50

To the experienced hospital executive the whole book and every part of it gives evidence that the author has learned his story in the field of experience and practice.

The book is full of good things, of value to hospital workers in general, and while we cannot all agree on detail the author has been able to communicate many methods of work in a pleasing manner. Hospital executives will surely find this book pleasant and profitable reading.

R. E. S.

**HANDBOOK OF SKIN DISEASES** By FREDERICK GARDINER, M.D. Second Edition. 12mo of 248 pages, with illustrations. New York, William Wood and Company, 1924.

This is a small book of about 250 pages containing 46 black and white cuts, as well as 12 colored plates.

The introduction deals briefly with the anatomical structure of the skin, clinical pathology, and a general outline of treatment. This is followed by short but accurate descriptions of the more common skin diseases, which are classified according to similarity of appearance, or because they occur in the same region. Finally a few pages are devoted to Tuberculosis and the Tuberculides, also to Syphilis and the Syphilides.

The work is well written, the illustrations are good, and the publishing itself is in keeping with the whole.

E. ALMORE GAUVAIN

**WHAT DOES YOUR CHILD WEIGH?** By EDITH B LOWRY, M.D. 12mo of 187 pages. Chicago, Forbes & Company, 1924.

The text and mission of Dr. Lowry's book are much more than the title would lead one to expect. It is really a treatise of the whole subject of Nutrition in children and the question of weight and height is merely an introduction.

As the writer truly says weighing and measuring children not only attracts attention to undernutrition, but it also attracts the child's attention to himself, his habits, his diet, and his home environment and hygiene. The causes of underweight are given as, 1, Faulty diet, 2, Faulty hygiene or health habits, 3, Over exercise, 4, Defects and disease, and lastly, Environment.

Very sensible ideas and advice quite in keeping with our newer knowledge of nutrition are set forth in the pages of the book. The subject is vitally important, its author is skilled both in the science of pediatrics and in the art of simple, sensible writing, consequently the combination and its product are both effective.

WM. HENRY DONNELLY

**MANUAL OF THE DISEASES OF THE EYE FOR STUDENTS AND GENERAL PRACTITIONERS** By CHARLES H. MAY, M.D. Eleventh Edition, revised. Octavo of 445 pages, with illustrations. New York, William Wood and Company, 1924.

The worth of this manual is told in the number of editions it has run through, this being the eleventh, and the number of foreign languages in which it is being published. These include French, Spanish, Italian, Dutch, German, Japanese, and to these has lately been added Chinese.

For the last twenty-four years this little book has remained a standard of its kind, and has only been changed sufficiently to keep it abreast of the times, the size and arrangement varying but little from that of the first edition.

As in all other editions this latest exactly meets the need for which it was intended—that of a compact, brief, but complete and modern exposition of diseases of the eye for students and general practitioners.

E. CLIFFORD PLACE.

**THE MEDICAL DEPARTMENT OF THE UNITED STATES ARMY IN THE WORLD WAR. Volume V. Military Hospitals in the United States.** By Lieut. Col. FRANK W. WEED, M.C., U.S. Army. Washington, Government Printing Office, 1923.

This volume includes a sketch of the evolution of the military hospital and a description of the development and organization of the military hospitals in this country during the war. One example of each type of military hospital is described in considerable detail, the other hospitals being disposed of in brief sketches of their physical surroundings and construction, with statistical tables covering the personnel and numbers of patients. This information includes as much as could be conveniently published in one volume. Detailed information concerning all of the hospitals is on file in the Surgeon General's Office, and it was thought that the volume furnished as much as would be desirable to those interested in the subject of military hospitals.

**PARENCHYMATOUS KERATITIS. INTERSTITIAL KERATITIS. UVEITIS ANTERIOR.** The Gifford Edmonds Prize in Ophthalmology. By W. T. HOLMES SPICER. Octavo of 63 pages. London, Geo. Pulman & Son, Ltd., 1924. (British Journal of Ophthalmology Monograph Supplement 1.)

This essay is a most complete and exhaustive resume of the subject, copiously supplied with unusually beautiful illustrations. The reader will be well repaid for the time spent in perusing it.

E. CLIFFORD PLACE.

**A PRACTICAL MEDICAL DICTIONARY** By THOMAS LATHROP STEDMAN, A.M., M.D. Eighth Edition. Octavo of 1145 pages illustrated. New York, William Wood and Company, 1924. Leather, \$7.00.

The first edition of this dictionary was published in 1911, and in the space of thirteen years seven editions have been disposed of. Few medical books of any kind reach an eighth edition, and to have accomplished this feat is an achievement of no little merit. From its first appearance it has been on the table of the present writer, and each new issue has confirmed and increased the good opinion originally formed of the value of the work. The book is accurate and comprehensive, after a somewhat critical use of this dictionary, extending over its whole career, we have been able to detect but few omissions (none of real importance), and still fewer mistakes. The present issue contains several new words, including many dental terms, entries regarding the mineral springs have been omitted, and (as in the previous edition) the plates have been relegated to the end of the volume. As it now stands the dictionary is thoroughly up to date, and medical readers and writers will find it entirely adequate for their needs.

R. J. E. SCOTT

**ETUDES MEDICO-RADIO-CHIRURGICALES SUR LE DUODENUM** Par PIERRE DUVAL, JEAN-CHARLES ROUX, HENRI BECLERE. Masson et Cie, Editeurs, Paris, France. 1924

This interesting study of the diseases affecting the duodenum is an example of the collaboration of Internist, Radiologist and Surgeon, rather more common in French medical literature than in our own. It has certain advantages but we may expect one of the factors to dominate in the best balanced team.

In this volume the radiologic side is somewhat more in evidence than the others although all have a share.

The first chapter is devoted to the Duodenum in Cholelithiasis and discusses, with some fulness, the relation of peri-duodenal adhesions to calculous cholecystitis and to cholecystectomy.

The second chapter on Essential Stenosing Periduodenitis, much less satisfactory, is preoccupied with the study of bands and adhesions to the point of ignoring the pathology of the duodenum itself.

Chapter three discusses the Chronic Compression of the Third Portion of the Duodenum by the Root of the Mesentery. A most interesting chapter, well illustrated and in which the authors show how much they have been influenced by American opinion.

Chapter four describes and discusses the operation of Duodeno-Jejunostomy and should be read and digested.

The concluding chapters on Duodenal Ulcer and on Duodenal Intoxication emphasize the authors' views on duodenal obstruction and the operative measures, especially duodeno-jejunostomy, indicated for its relief.

The book is well printed on good paper. The X-ray reproductions are particularly clear. J. E. J.

**GASTROPATIAS DE ORIGEN RENAL, ESTUDIO CLINICO Y PATOGENICO.** Por el DR. JUAN RAUL GOYENA, Profesor suplente de Clinica Medica, de la Facultad de Medicina de Buenos Aires Medico de Sala del Instituto Modelo de Clinica Medica. "La Semana Medica," Imp de Obras de E. Spinelli, 2254 Cordoba, Buenos Aires. 1924

This monograph consists of a clinical and pathological study of gastric disorders due to renal diseases. It is a small book, well written and in plain Spanish. It sums up a subject so often neglected by the textbooks on Medicine and Surgery. Of special interest is the author's studies on nephritic patients with retention and increased chlorides and blood urea. He found that retained chlorides are practically always excreted through the gastric mucosa, which in turn irritate and then cause congestion of the mucosa, which produce so called symptoms of indigestion, whereby the physician may be misled in treating a gastric disorder when in reality it is primarily a Nephritis, unless he has been careful in making a thorough physical, urine analysis and blood examination. In cases where the blood urea is high and constant he describes four forms of gastric disorders seen in his hospital and private practice, viz.

- 1.—Attenuated form (migrainoid, gastric catarrh dyspepsia)
- 2.—Intermittent or paroxysmal form (Gastralgia, gastric crisis incorrigible vomiting)
- 3.—Erosive form (ulceration)
- 4.—Prolongated form (pseudo cancer of stomach)

He cites numerous cases, going into them quite thoroughly affected by the above forms of gastric disorders due to renal diseases. It is a book well worth reading because it makes one more cautious when examining patients to bear in mind that gastric diseases at times may be a manifestation of renal diseases.

GAETANO DE YONANA

**MEDICAL GYNECOLOGY** By SAMUEL WYLLIS BANDLER, M.D. Fourth Edition, thoroughly revised. Octavo of 930 pages with 157 original illustrations. Phila. & London, W B Saunders Company, 1924. Cloth, \$8.00

If there is one outstanding merit of this book it is that it emphasizes the value of office treatment as against operation. This book is not dogmatic and offers many courses to follow, should some previous method tried, been found wanting.

The work is brought up to date and the newer remedies, physical and chemical, are thoroughly reviewed and their value properly appraised. This book is of value for the general practitioner as well as the specialist. G W P

**THE PATHOLOGY AND TREATMENT OF DIABETES MELLITUS** By GEORGE GRAHAM, M.A., M.D. 12mo of 188 pages. London, Henry Frowde & Hodder & Stoughton, New York, Oxford University Press, 1923. Cloth, \$2.00 (Oxford Medical Publications)

The book consists of two parts. Part one contains an account of the physiology of the metabolism of sugar and part two, a description of the different types of Diabetes Mellitus and the treatment of the disease. In the appendix there is a description of the ladder diet of St. Bartholomew's Hospital, tables of food values, laboratory methods and a discussion of the ketogenic-anuketogenic ratio.

The work embodies the Goulstonian Lectures by the author on glycaemia and glycosuria. The blood sugar renal threshold is discussed at some length. The usual figure is believed to be about 0.18 per cent, but the threshold may be raised in cases of severe diabetes. It is stated that the blood sugar may be raised in pneumonia and nephritis without sugar being excreted, figures up to 0.28 per cent being reported.

Two days of fasting at the beginning of treatment are still favored by the writer, only tea, coffee, meat extract and water being allowed. Whether or not the patient is sugar free he is not allowed to fast more than two days at a time. The ladder plan is then followed. This is a form of under nutrition and the author favors this rather than the method by which carbohydrate tolerance is determined early in the treatment by adding carbohydrates other than in vegetables.

The book is well written and is an interesting exposition of methods slightly different than those in use in many clinics in this country. W E. McCOLLOM

**EPIDEMIC ENCEPHALITIS** By ARTHUR J. HALL, M.A., M.D., F.R.C.P. London, New York, William Wood & Company, 1924, 229 pp, 12 illustrations, 8 vols cloth.

This volume represents the collected Lumleian Lectures delivered before the Royal College of Physicians at London in 1923 on the subject of Epidemic Encephalitis.

The extensive literature of this disease which has grown to such enormous proportions since the original reports of Cruchet, Moutier and Calmette, and that of Von Economo has been thoroughly reviewed, material assistance being afforded the author, however, by the compilation previously made by the Ministry of Health of Great Britain and presumably that of Achard in his earlier presentation of the same subject. These accumulated facts comprising more than 75 pages of bibliography the author has succeeded in condensing to form a concise orderly presentation of our present knowledge of this new disease.

The average reader will find this book instructive and will be surprised by the information which has already been accumulated on the subject. The student of epidemic encephalitis will save much time in his literary research work by consulting this publication.

RECENT ADVANCES IN MEDICAL EDUCATION IN ENGLAND  
A Memorandum addressed to the Minister of Health  
by Sir George Newman, KCB, MD Octavo of  
195 pages London, His Majesty's Stationery Office,  
1923 Paper, 1s.3d net

Recent advances in Medical Education in England is a memorandum addressed to the Minister of Health and published by His Majesty's Stationery Office, and contains an account of the Medical Education in England and a brief history of the circumstances of which that position is the outcome

This book contains chapters on the teaching of the Preliminary Sciences and the various definitions of the Medical Curriculum

The chapter on Preventive Medicine in Medical Practice tells what kind of knowledge is necessary for the general practitioner to vitally appreciate the part played by this branch

Of special interest is the Chapter on the Association of Research with Education This gives in detail the principal subjects in which research has been undertaken Worthy research requires a prepared mind, experience, leisure, imagination, learning and high technique. It is not for the inexperienced undergraduate with other tasks on hand, but there is here, nevertheless something vital for him which has heretofore been gravely neglected in our national schemes of Medical Education and that is to learn to love research, to know its methods, to be moved by its spirit, to appreciate its stupendous achievements, to recognize that in it alone can the future be secured This is what we have neglected to teach the medical student It has not been explained to him that all knowledge comes by scientific investigation and research, clinical as well as other Moreover, the teacher who is not imbued with the spirit of research is unable to wisely teach and thus it comes about that an inspired teacher and a seeing student are the two desiderata.

Listen to the inspiring words of Sir Clifford Allbutt in the concluding chapter—

"At this moment it is revealed to us that Medicine has come to a new birth What is then the new birth, this revolution in medicine? It is nothing less than its enlargement from an art of observation and empiricism to an applied science founded upon research, from a craft of tradition and sagacity to an applied science of analysis and law, from a descriptive code of surface phenomena to the discovery of deeper affinities, from a set of rules and axioms of quality, to measurements of quantity"

The book is very interesting and should be read by everyone interested in Medical Education

DIET FOR CHILDREN (AND ADULTS) AND THE CALORIE KIDS By LULU HUNT PETERS, A.B., M.D., author of Diet and Health, With Key to the Calories Pediatrician Los Angeles County Hospital Dodd, Mead and Company, 1924 Price \$2.00

Dr Peters has written a book for mothers who, after all, have the immediate care and responsibility of feeding children

In her preface she very truly says, "The proper diet for your growing children is practically the foundation diet for yourself and the other adult members of your family"

Such great advances have been made in the last decade in nutrition that any publication which presents the newer knowledge of this all important subject in a simple fashion for the mother in the home must be cordially welcomed Physicians and especially pediatricians are at present laying such stress on preventive measures as opposed to curative methods, that it is only logical that such measures should begin in earliest childhood

The various constituents of a well balanced diet are simply enumerated and explained and then a full set of menus is given for the preparation of meals for children, which will observe the cardinal principles of nutrition.

There are chapters on the Malnourished Child, the Fat Child, on Bedwetting, on Acidosis, Rickets, Convulsions and other important subjects The style is simple, as it should be for lay readers, and the subject matter quite in keeping with our present knowledge of essential foodstuffs and the prevention of deficiency disease Such a book cannot fail to be of great service, especially to the young mother who is often confused by the conflicting views and advice of friends and relatives who mean well but who are not familiar with true food values  
WILLIAM HENRY DONNELLY

FIGHTING FOES TOO SMALL TO SEE. By JOSEPH McFARLAND, M.D., ScD, Professor of Pathology, Medical Department of the University of Pennsylvania. 64 engravings F A Davis Co., Phila., 1924 Price, \$2.50 net.

This book is a compilation of lectures delivered by the author to a gathering of lay people on the subject of Microbiology In spite of the fact that the subject has so technical a sound, the author has well succeeded in very interesting and fascinating reading matter

Here the author speaks to lay people, in terms of lay language in the origin of micro-organisms, the ancient conception of spontaneous generation of life, etc. And then the author fully and simply explains the modern views of infection and immunity, prevention and transmission of disease, illustrating the material with drawings and photographs

To the practicing physician this book illustrates how a technical subject can be successfully put to lay people in lay language.  
S J COHEN

INCOMPATIBILITY IN PRESCRIPTIONS AND HOW TO AVOID IT By THOS STEPHENSON, D.Sc., Ph.C New Edition Octavo of 32 pages Edinburgh, "The Prescriber" Office. 1924 Paper 1/6d net.

This is a typical British booklet—paper, cover, advertisements on cover pages and typographically The subject matter is well presented, authentic and up-to-date. The author disposes of the old aspirin-quinine incompatibility by saying it "is untrue—there is no such incompatibility", and he is probably correct One wonders why anyone should wish to combine quinine and aspirin To those not familiar with prescription incompatibilities this little booklet will prove a real aid. It is brief, accurate and readable.

THE PRINCIPLES AND PRACTICE OF OBSTETRICS By JOSEPH B DELEE, A.M., M.D Fourth Edition, thoroughly revised Large octavo of 1123 pages with 1128 illustrations Phila. and London, W B Saunders Company, 1924 Cloth, \$12.00

A lengthy review of this book is not at all necessary as in the reviewer's opinion it is one of the best books on Obstetrics, written in the English language.

It is profusely illustrated and the bibliography is full Dr DeLee has the happy quality of writing so that the material written is clearly understood, not ambiguous

If there is any criticism that the reviewer feels forced to make it would be on the scant dismissal of Dr Potter's work Very few agree on the indications of Dr Potter but he has surely taught the Obstetrical specialist a new art in his method of version

Prophylactic forceps is still a very fertile field for disagreement

## THE TREATMENT OF LOBAR PNEUMONIA WITH PNEUMOCOCCUS ANTIBODY SOLUTION \*

By RUSSELL L. CECIL, M.D.,  
NEW YORK CITY

TWO years ago, Cecil and Larsen<sup>1</sup> reported the result of their experience in the treatment of lobar pneumonia at Bellevue Hospital with polyvalent solution of pneumococcus antibodies prepared according to the method of F. M. Hinton<sup>2</sup>. This agent, usually spoken of as pneumococcus antibody solution, is an aqueous extract of the protective substance in polyvalent anti-pneumococcus serum. By an ingenious device, Hinton succeeded in removing the immune substance from the serum and resuspending it in water. Cecil and Larsen treated 424 cases of pneumococcus pneumonia with intravenous injections of pneumococcus antibody solution with a death rate of 21.4 per cent. 410 control cases under observation at the same time, and treated, except for antibody injections, in a similar way showed a death rate of 28.3 per cent. In other words, antibody treatment seemed to have brought about a reduction of approximately 25 per cent in the death rate. The most striking results were obtained in Type I and Type IV infections. In the former group, the death rate in treated cases was only 13.3 per cent, while the controls show a death rate of 22.2 per cent. In the Type IV group, the treated series yielded a death rate of 16.4 per cent, against 24 per cent for the untreated cases. Still better results were obtained with antibody solution, when it was administered early in the disease. In a series of 114 cases treated intravenously during the first two days of the disease, the death rate was only 13.1 per cent, whereas in 157 early control cases the death rate was 26.7 per cent. Again the most striking difference was noted in the Type I and Type IV cases. In Type I pneumonias treated early, the death rate was only 8.9 per cent, as compared with 23.5 per cent for early Type I controls.

About the same time Conner<sup>3</sup> reported equally favorable results on a series of 116 pneu-

mococcus pneumonias treated with antibody solution in the wards of the New York Hospital.

At the time our first report was made, we felt convinced that in pneumococcus antibody solution we had a new and valuable specific agent for the treatment of pneumococcus pneumonia. One of the chief advantages of the agent was its almost complete freedom from horse protein. This eliminated the danger of anaphylactic shock and the possibility of serum sickness. Another great advantage of the antibody solution was its polyvalency. The statistics on our original series showed the effectiveness of antibody solution in the treatment of Type I, Type II, and Type IV pneumonia. No particular benefit could be demonstrated experimentally or by statistics in the treatment of Type III pneumonia with antibody solution.

In our previous report it was pointed out that the intravenous injection of 50 or 100 cc of antibody was, in most instances, followed by a rather characteristic reaction. Thirty to forty-five minutes after the injection the patient usually had a chill, which was accompanied by a rapid rise in temperature, often amounting to two or three degrees. Sometimes even higher shoots were observed. Following this sudden rise, there was a rapid fall in temperature, accompanied by profuse perspiration.

The following case (Fig. 1) shows the typical reactions which occur when antibody is injected intravenously in a patient with lobar pneumonia.

This patient, infected with pneumococcus Type I pneumonia, received his first injection of antibody on the second day of the disease. Following the administration of 50 cc of antibody solution intravenously, the patient had a chill and his temperature arose from 105° to 106.7°. The temperature then began to drop rapidly and on the following morning had reached 100°. A second intravenous injection of 50 cc of antibody solution was then administered. The patient again had a chill, the temperature rose to

Prophylactic forceps is still a very fertile field for disagreement  
G W P

third day, after two injections of antibody had been given, the patient's blood showed considerable protection, and on the morning of the fourth day still more immune substance was present in the circulating blood. On this day the temperature of the patient reached normal.

Fig. 4 illustrates a pneumococcus Type II pneumonia in which subcutaneous treatment with antibody failed to stop the infection. Treatment was started on the second day of the disease and daily injections were given, until the seventh day, when the patient died. None of the subcutaneous injections caused any general reaction, nor was any clinical effect on the course of the disease demonstrable. On the fifth day, the blood cultures became positive, in spite of much antibody treatment, and the number of bacteria in the blood increased daily, until death occurred.

Fig. 4

The results during the winter of 1922-23 were fairly satisfactory. Altogether, 52 early cases of pneumococcus pneumonia were treated subcutaneously, with a death rate of 21.1 per cent. In 59 control cases admitted during the first 48 hours of the disease, the death rate was 40.6 per cent, almost twice as high.

In the fall of 1923, it was decided that all cases of lobar pneumonia, both early and late, should be included in the experiment. Every other case throughout the twelve medical wards was treated subcutaneously with pneumococcus antibody solution, the alternate cases being reserved for controls. The results during the past winter were not so good as in 1922-23. Between November 15, 1923, and March 1, 1924, 92 cases of pneumococcus pneumonia were treated subcutaneously with pneumococcus antibody solution, with a death rate of 32.6 per cent. Ninety-five alternate cases that were not treated with antibody showed a death rate of 37.8 per cent. When the early cases were filtered out of the 1923-24

series and added to the early pneumonias treated during the winter of 1922-23, the antibody series showed some advantage (see Table I). Seventy-nine early cases of pneumococcus pneumonia were treated subcutaneously with antibody, with a death rate of 21.5 per cent. Whereas 94 control cases showed a death rate of 36.1 per cent. As in the case of intravenous treatment, the best results were obtained in Type I and Type IV infections.

After two years' experience with the subcutaneous administration of antibody in the treatment of pneumonia, we have reached the conclusion that, while certain of the earlier cases of Type I and Type IV pneumonia were apparently benefitted by subcutaneous antibody injections, there are several reasons why this form of treatment is not practical. The dosage required for subcutaneous treatment is too large. Pneumococcus antibody solution is expensive and the results obtained are not sufficiently striking to justify such a procedure. Furthermore, there is considerable local discomfort in many cases following the subcutaneous injections.

TABLE I  
DEATH RATE FOR ALL PNEUMOCOCCUS PNEUMONIAS TREATED SUBCUTANEOUSLY DURING FIRST 48 HOURS OF DISEASE, COMPARED WITH CONTROLS ADMITTED DURING FIRST 48 HOURS OF DISEASE. A COMBINATION OF 1922-23 AND 1923-24 SERIES

Type	TREATED CASES			CONTROL CASES		
	Cases	Deaths	Death Rate %	Cases	Deaths	Death Rate %
Pn. I	23	4	17.3	23	6	26.0
Pn. II	13	5	38.4	25	13	52.0
Pn. III	6	3	50.0	21	9	42.8
Pn. IV	37	5	13.5	25	6	24.0
Total	79	17	21.5	94	34	36.1

During the last few months we have returned to the intravenous method of administering antibody solution. Through the kindness of Dr. Huntoon, we have been able to obtain several lots of antibody which give no chill or other untoward symptoms, when injected directly into the vein. In cases treated with these particular lots of antibody, there has been a slight rise of temperature following the injection, followed by a rapid fall and profuse perspiration. Only a few cases have been treated with these new lots, but the therapeutic effect appears to be just as good as with the chill-producing lots. If the substance which causes chills can be effectually eliminated from pneumococcus antibody solution, there is no reason why this agent should not be injected directly into the veins of any case of pneumococcus pneumonia.

FIG 1

104°, then dropped rapidly to normal, where it remained permanently

Fig 2 shows how ineffective intravenous injections of antibody may prove in some cases of Type III pneumonia. This patient received an enormous quantity of antibody intravenously, but in spite of this treatment the blood culture became positive, the patient developed pneumococcus Type III meningitis and died on the eleventh day of the disease

FIG 2

In some cases, where the rise in temperature was excessive, the patient became delirious, and with the fall in temperature symptoms of shock developed, occasionally so pronounced as to endanger life

In view of these severe reactions, it was felt that some modification in the method of preparation or administration of antibody was necessary before this agent could be made applicable in the general practice of medicine. Accordingly, in the fall of 1922, we undertook with Dr H S Baldwin to study the effect of pneumococcus antibody solution when administered *subcutaneously* to patients with lobar pneumonia. During the winter of 1922-23, all cases of early pneumonia admitted on six of the medical wards were treated subcutaneously with pneumococcus anti-

body solution. In the other six wards, no antibody was administered

In the studies of Cecil and Larsen, antibody solution was administered intravenously in doses of 50 to 100 c c. Larger doses were employed for subcutaneous treatment. In ordinary cases, 100 to 200 c c was the initial dose, repeated in ten or twelve hours. If necessary, two more injections of about the same amount were given on the following day. By the third day, the treatment could usually be limited to one injection. In severe cases, the initial dose was 200 to 300 c c, repeated in ten or twelve hours, and continued every day until the temperature came down to normal. The average total dosage per case was about 650 c c

The antibody solution, when given subcutaneously, was injected into the loin or lateral aspect of the anterior abdominal wall. Subcutaneous injections of even large amounts of antibody failed to excite constitutional reactions. Occasionally, there were slight chilly sensations, but the hard, shaking chill observed after intravenous injections never occurred. At the point where the antibody was injected, the skin became moderately red and tender over an area which varied in proportion to the amount of fluid injected

Fig 3 shows the effect of subcutaneous injections of antibody on a case of Type I pneumonia. The patient was admitted to the hospital on the first day of his disease. On the second day, two large doses of antibody were administered subcutaneously. The patient showed no constitutional reaction whatever, but the temperature dropped from 105° to 102° on the morning following. Two more subcutaneous injections were given and on the morning of the fourth day the temperature had dropped to 101°. By the afternoon of the fourth day the temperature was normal and remained so. The dotted line below the temperature curve indicates that development of protective bodies in the patient's serum. No protective substance was demonstrable on the second day of the disease before treatment with antibody was started. On the morning of the

FIG 3

largely on the character of the infecting organism and the resistance of the infected tissues

Similar wound inoculation may occur in tears of the pelvic floor, the vagina and cervix. At first this wound infection is a local process which stimulates a local tissue reaction in the surrounding structures, and whether it remains a primitive local infection, or becomes a consecutive infection, is due to the multiplication of bacteria and extension through the surrounding lymphatics or blood vessels, depends on these three factors

*First* the local resistance of the tissue,

*Second* the general resistance of the patient,

*Third* the virulence of the strain of the infecting organism

It is a well-known clinical fact that local tissue resistance is lowered by injury, and that during delivery the cervix sustains continued trauma. If it be inspected at the termination of labor it may be seen to hang as a flaccid, ecchymotic, mulacerated rim, presenting little or no power of local resistance—if we add to this instrumental or digital trauma, and the cervix becomes a lacerated wound—which, all surgeons will tell you, will not heal until the superficial areas slough and a granulation zone is established, the soil is more favorable for infection.

The one point which must be kept constantly in mind by the obstetrician is that the repair and the pathology of the cervical or uterine wound is in nowise different to that of a contused or lacerated wound on the surface of the body—save that the lymphatics and blood vessels are all enlarged, and that the incidence of infection is infinitely greater.

The general resistance of the patient may be lowered by hemorrhage, complicating toxemia and general ill health, and thus favors infection, therefore, in the presence the lowered resistance from obstetric trauma and the diminished individual tissue reaction from antepartum or postpartum bleeding or toxemia—pyogenic bacteria may gain entrance to the wound and spread through the lymphatics before the natural local barriers have been established.

Pathological observation has shown that the more virulent the strain of bacteria, the less local barrier is developed, illustrated by the occurrence of spreading purulent peritonitis and bacteremia in puerpera showing little or no defensive pathology.

Definite pathological lesions which are due to infection of the puerperal wound may be grouped under the following head

1 Puerperal ulcers result from bacterial inoculation of wounds in the perineum, vagina and cervix—these ulcers may remain as local lesions with well-defined surrounding tissue reaction, or become the foci for the development of

consecutive lesions by the multiplication and spread of bacteria through the surrounding lymphatics

2 Puerperal endometritis—a bacterial inoculation of the great uterine wound, with its mass of detritus, decidua and blood clots

3 Infection of the sinuses of the placental site, with their thrombi producing a thrombophlebitis of the uterine and pelvic veins

4 Invasion of the parametrial tissues—either by direct extension from a cervical wound, or by extension through the uterine wall by way of the uterine lymphatics

5 Bacteremia or blood stream infection—in this condition the bacteria reach the blood stream either by way of the lymphatics or directly through the blood vessels, and multiply within the blood, producing their toxins and destroy the corpuscular elements

Finally puerperal peritonitis—pyogenic bacteria reach the peritoneum and produce a local or general peritoneal reaction. The organisms may reach this tissue by way of the lymphatics and produce a fatal peritonitis without the presence of organisms in the blood.

What is of interest to us in this discussion is the answer to the question—which of these lesions require surgical treatment?

Certainly the puerperal ulcer, whether it be on a wound of the vulva, perineum, vagina or cervix, demands nothing more than wound cleanliness, removal of sutures and drainage—active treatment by the use of cauterants and strong chemical disinfectant during the acute stage of an ulcer is no more justified in the ulcer of the genital tract than in ulcers in other locations.

When the primary focus is a saprophytic endometritis, there is a certain definite train of characteristic symptoms which result from nature's effort to limit the extension of the infection by the formation of a leucocytic barrier in the basal membrane of the endometrium which in turn produces a superficial tissue necrosis—the lochia is profuse, bloody and fetid, and is frothy from an admixture of gas bubbles—the after pains continue, and from time to time a clot is expelled by painful uterine contractions, which are evidences of a relaxed uterus, there is fever from the absorption of the toxins produced by the superficial tissue necrosis and uterine involution is retarded.

On examination, the uterus is large, tender and more or less relaxed—the cervix is open, swollen and eroded, and if the gloved finger is passed into the uterine cavity, clots and necrotic debris are encountered and the interior of the uterus is found rough and shaggy.

In closing, I wish to emphasize once more the importance of early treatment in the application of any form of specific therapy for pneumonia. Pneumococcus infection travels very rapidly through the lymphatics of the lung and easily spreads from one lobe to another. Finally, the blood stream becomes involved and then the problem of controlling the disease becomes very difficult. The process must be stopped in its in-

ciency, if success is to be achieved in the severer forms of infection.

## WHAT TYPES OF PUERPERAL INFECTION REQUIRE SURGICAL TREATMENT? \*

By JOHN OSBORN POLAK, M.D.

BROOKLYN, N. Y.

**B**EFORE attempting to answer this question, one should review the immunity which the average parturient has against septic invasion, as well as become conversant with the pathologic steps of consecutive infection.

During pregnancy, the cervical mucus plug, the unruptured membranes—and later in the 1st and 2nd stages of labor, the rupture of the waters with their downward rush, the rotary descent of the child through the birth canal, all have a controlling influence on the invasion of bacteria from the vagina, while after delivery, the anti-bacterial quality of the lochia, the contraction and retraction of the uterus, and the development of the leucocytic wall or zone in the basal membrane, prevent the easy entrance of bacteria to the uterine lymphatics.

Normally, the bacterial flora within the vagina is kept under control during pregnancy, by the acid reaction of the vaginal secretion, though this acidity is somewhat weakened during pregnancy by the addition of an increased amount of cervical mucus. After labor, these same bacteria rapidly multiply in the retained lochia in the vagina.

Bacteriological studies of the content of the puerperal uterus, at varying periods after labor, have shown that pathogenic organisms of the same type and strain as those in the vagina are present in the uterus, as early as 24 hours after labor—and are found at the placental site within 48 hours. Furthermore, it has been shown that these bacteria which are present in the normal puerperal uterus, are the same as those found in the uterus of the woman suffering from fever—hence it must be deduced that infection does not depend so much upon the character of the organism, as upon the condition and resistance of the tissues of the birth canal. We know that a long continued dry labor predisposes to the rapid increase of bacterial growth—both in the vagina

and in the uterus, and also that it distinctly lessens the resistance of the maternal tissues.

The fundamental requisites to all infection, wherever it may occur, are

- (1) the presence of an infecting organism,
- (2) of an avenue of entrance,
- (3) a soil for development—granting this to be the fact, all infection is primarily a wound infection, or an inoculation of a wound by pathogenic bacteria, and the local and general symptoms produced thereby are due to their development and the production of their toxins in such a wound.

In the genital tract of the puerperal woman, we have the pathogenic bacteria constantly present—or being carried into it by hand, instrument or other vehicle.

The puerperal woman offers the avenues of entrance in the form of lacerations of the vulva, vagina and cervix, the open uterine cavity and the relaxed placental site, while all of the blood vessels and lymphatics are immensely dilated. It seems remarkable therefore, that more parturient women are not infected, than actually become subjects of puerperal fever.

While there is no question that autoinfection is a possibility, and that it does sometimes occur, most infections are conveyed to the uterus by the attendant (a) by unclean hands, (b) through an unclean vulva, (c) by unsterilized instruments into a wounded and traumatized birth canal.

Admitting this to be a fact, one can readily appreciate the value of routine rectal examination, and realize the importance of detailed surgical cleanliness in making vaginal examinations, and in performing all obstetric operations.

The uterus during involution, should be considered as a puerperal wound undergoing the normal process of repair healing by granulation, and its inoculation will produce either a toxemia or a definite inflammatory reaction—depending

\* Read at the Annual Meeting of the Medical Society of the State of New York, at Rochester, April 23, 1924.

Metro-thrombophlebitis or suppurative pelvic phlebitis, begins as an infection of the thrombi in the placental site. This type of infection is always preceded by a relaxed uterus, persistence of a red lochia, and the occurrence of cramp-like uterine pains.

The bacteria multiply within the clot—they liquefy it and escape to the blood stream, only to be shut off again by the formation of a more extensive clot. The liquefaction of the clot escape and reisolation of the bacteria produce the clinical syndrome of chill, fever, sweat and remission which makes the diagnosis.

It has been stated that pelvic phlebitis is always fatal, in spite of the conservation of nature's forces of resistance. To this statement I cannot subscribe—but I will admit that the majority of fatal puerperal infections will show a thrombophlebitis at autopsy.

The lesions may be found in the uterine sinuses or in the veins of the upper uteroovarian or inferior hypogastric pedicles, and the diagnosis is made on the following signs:

The appearance of chills occurring in the second week—usually between the eighth and twelfth days, which become more and more frequent, followed by sharp rises and marked remissions in temperature—and an absence of any febrile reaction between the chills.

The pulse runs a course parallel to the temperature—up when the temperature is up, and down when the temperature is low. The general condition of the patient in the interval between chills and temperature exacerbation is extremely good—the blood cultures are negative, for the bacteria are confined within the clot only when embolus develops with lung complications is the facial and physical appearance alarming. Pulmonary complications may develop between the eighth and twenty-eighth day after the beginning of the infection. Dyspnea and asphyxia dominate the clinical picture.

It has been suggested that these cases of metro-phlebitis be treated with hysterectomy, and that in pelvic phlebitis the veins (ovarian and hypogastric veins) should be ligated.

The question is, when to operate—for could we remove the uterus, before spread of the lesion has taken place in every potential infection, the

source of bacterial supply might be controlled, but when the infection has spread beyond the uterus, hysterectomy gives a mortality of 100%—so too, in pelvic phlebitis if the operation is performed too late or too early, as before the fifteenth or after the twenty-fifth day, the mortality is very high.

If it is done at all—it should be done in the third week, the veins should be tied, but not excised—as manipulation tends to disseminate the infection.

In peritonitis of puerperal origin, the lesion is either the result of an extension through the myometrium to the perimetrium with an exudate thrown out by the serous coat of the uterus, in which case, the lesion results in adhesion or abscess—and with the aid of posture becomes localized, or the peritoneum is reached by a direct invasion through the lymphatics—in which case we have a spreading peritonitic exudate with cell death, and the formation of pus.

These cases always show the clinical syndrome of a spreading peritonitis, distension, tenderness, intestinal colic and vomiting, with rise in pulse and temperature and a polymorphonucleosis.

All forms of operative treatment have been used with the same fatal result—and we must fall back on simple stab-wound incision drainage and injection of ether into the peritoneal sac.

It stands to reason that in bacteremia, a condition in which the bacteria are circulating in the blood and are rapidly overcoming the immunizing substances in the cellular elements—as shown by the rapid destruction of the red corpuscles and leucocytes, that no surgical treatment can be of any avail—for the bacteria are rapidly multiplying and producing their toxins in overwhelming quantities, irritating the kidneys, disturbing the intestinal and liver function, and poisoning the heart muscle.

Hence we must come back to the basic principle, that the treatment in puerperal infection, depends on the pathologic diagnosis and that because of nature's protective processes it must be expectant and supportive—rather than surgical.

Finally, that surgical measures have their only field in the incision and drainage of parametric abscesses and in local spreading peritonitis.

It will naturally be inferred that the prognosis in this type of infection depends on the establishment of proper uterine drainage, by firm retraction and contraction of the uterus, if this can be maintained, a passive hyperemia is produced which favors the formation of a wide protective barrier consisting of leucocytes and small round tissue cells, which is impenetrable to the lower types of pyogenic organism, this protective wall separates the lymphatic from the infected necrotic endometrium

As late as 1922 Bumm urged that in febrile puerpera the genitalia should be left alone—for wound fever in the majority of cases is due to lochial stasis, which can be combated with drainage and uterine contraction

Only in the presence of relaxed, misplaced uterus will it be necessary to aid these natural processes—and here, such aid may be given by the judicious use of the Ill tube, repeated alcohol irrigations, and the iodoform wicks—when these are employed and placed in the cavity of the uterus, drainage and retraction are stimulated and these cases of lochial stasis clear up promptly and the infection remains confined within the uterus

With every puerperal endometritis, there is always an associated metritis—this is a defensive reaction on the part of the myometrium and the intermuscular lymphatics against the infecting cocci. Metritis is a more definite pathological entity in coccal endometritis than in the saphrophytic form owing to the greater penetrability of the pyococci. When the endometrial infection is due to the streptococcus pyogenes the lochia has no fever—is diminished, serosanguineous or seropurulent in character, and the interior of the surface of the uterus is usually smooth and not deeply necrotic. The layer of granulation tissue in the leucocytic zone is developed but not so extensively, as in the saphrophytic type, but as a rule this granulation zone suffices to limit the infection to within the uterus, unless nature's beneficent processes are disturbed by the meddling of the accoucheur—hence, we can lay down the principle in the treatment of puerperal endometritis, that surgical methods have no place, for posture, an ice bag over the fundus and hypodermatic employment of oxytocic drugs will stimulate uterine contraction and retraction which offers the greatest barrier against further bacterial invasion

The lower segment of the uterus is surrounded by cellular connective tissue—bacteria may reach this structure through lacerations of the cervix which lead directly into it, or from an extension of an endometritis to the myometrium and intermuscular lymphatics which lead into the peri-uterine cellular structures

The majority of the cases of cellulitis are due to infection by streptococci—these bacteria invade the lymph channels, and by their presence and the presence of their toxins excite a hyperemia in the surrounding cellular tissue, this is followed by an effusion of protective serum, and a hurried migration of leucocytes into the connective tissue surrounding the blood vessels and lymphatics

This tissue in turn, produces a small round cell reaction which further increases the size of the exudative mass—the rapid increase of this swelling, distending the folds of the broad ligament or parietal peritoneum and limiting motion causes pain, while the cell activity accounts for the temperature and leucocytosis

These parametritic exudates because of their location, intimately blend and are continuous with the uterine mass, efface the vaginal fornix and obliterate the line of demarcation between the cervix and surrounding tissues—the uterus is displaced upward and toward the opposite side of the pelvis. The formation of this exudate must be considered as a conservative process on the part of nature—an attempt to limit the advance of the bacterial invader, therefore, one can readily see that any form of surgical intervention can do nothing but harm until there is abscess formation. An exudate poured into the cellular tissues of the pelvis may be absorbed, leaving no trace except a slight shortening of the broad ligament on one side, and varicosities of the pelvic veins—these always result from the venous engorgement necessary for the production of a protective exudate

If the infection is long continued, organization will take place and scar tissue will be substituted—this is a common sequel, the shortened, thickened broad ligament distorts the position of the pelvic organs, compresses the blood vessels and ureters and is frequently the cause of ureteral stricture and premenstrual hydroureter

Abscess formation occurs in parametrial infection (in about 7 cases out of the 100), these localized collections of pus are easily recognized by the characteristic evening rise in temperature, the polymorphonuclosis and the physical evidence of a fluctuating mass

In the presence of such a lesion—incision and drainage is demanded. This may be done through the vagina, or by an extraperitoneal incision just above Poupart's ligament between the folds of the broad ligament

Broadly speaking, it may be stated therefore, without fear of contradiction, that surgical measures employed to combat puerperal septic infection are only efficient when the infection is localized

the mucous and amniotic fluid which may have gathered in its mouth is removed. Slowly deliver the nose and brow until the head is completely over the perineum. During this time the patient is in the modified Walcher position and deeply asleep. Care should be taken at this stage to deliver the child in the direction of the birth canal and not up over the mother's abdomen as that position will break the child's neck.

After the baby is delivered it is placed upon the mother's abdomen, care being taken to keep the baby on its right side. It should not be spanked or held up by its feet or shaken in order to hasten the establishment of respiration. So long as the heart beat is strong and the child has a good blue or red color there is no cause for anxiety (Perlman, of St. Louis, says chest breathing). If, however, the breathing of the child is delayed resuscitation may be necessary. Our method is the use of a small soft rubber catheter introduced directly into the larynx and blowing air into the lungs and expelling it by pressure upon the child's chest.

The cord is severed after pulsation has ceased and the patient given one cc of obstetrical pituitin to aid in the completion of the third stage of labor. The pituitin is given after the child leaves the uterus. It is never given when the child is in the uterus.

In applying this operation one must not be in too great a haste. At no stage should the operator hasten delivery unless the child's condition is serious. Twenty-four minutes have been taken to deliver the baby after the umbilicus has appeared.

Secondly. The patient should be completely anesthetized. This is necessary until the version is completed, in other words, until the knees appear at the vulva. The choice of anesthetics may be left to the operator. In our experience we have obtained the best results with chloroform.

Thirdly. The cervix must be completely effaced and the os dilated or easily dilatable before version is attempted. The failure of this operation in many respects is due to the fact that these precautions are not observed.

Fourthly. The birth canal should be thoroughly dilated, and this is accomplished by first obtaining the relaxation of the perineum through a gradual increase of the number of fingers of the hand employed. After the perineum is dilated the vagina is prepared in the same manner. This dilation is essential and should not be started until the patient is asleep. The best lubricant to use upon the hand is sterile green soap.

Keeping these essential points in mind one

will be able to facilitate his work in the employment of this operation. In order that the indications and the applications of this operation may be more definitely defined I have selected one hundred cases which I have delivered by version that reveal the different obstetrical complications. The larger number of the cases in this group comprise those of mal-position. The left occiput posterior was the one most frequently encountered. Sixty of these cases on examination proved to be of this type, four of which were complicated with prolapsed hand, five associated with pendulous abdomens, two had had a previous Gilliam operation.

The next position most frequently encountered was the right occiput posterior. Twenty of the cases come under this classification.

The left occiput anterior was encountered in eight cases, and the right occiput anterior occurred in seven cases.

A face presentation was seen in two cases, while there are three cases on the transverse type. Maternal complications associated with these positions were four cases of cardiac disorder in the mother. Three cases of mitral regurgitation and one case of mitral stenosis. Five of these cases had eclampsia and placenta previa was encountered in six cases, two of which were the central placenta previa and four were marginal, with the os easily dilatable.

Oedema of the cervix, due to long labor without any progress, one case. Inertia, due to fibroid, one case. Inertia, due to pendulous abdomen, and inertia due to previous operative procedures on the uterus, such as the shortening of the ligaments, two cases. Prolapse of the cord occurred in four cases and we divide these cases into the concealed and non-concealed types.

Premature rupture of the membranes occurred in twenty cases without engagement of the head. One should always expect a mal-position when this occurs.

Contraction of the pelvis was encountered in ten cases, three were primipara with an external conjugate of seventeen centimeters or less. Hydramnios was encountered in three cases. The membranes were ruptured high up in an attempt to allow the fluid to escape slowly. One of the babies of this group was accrania, the other a hydro-cephalus in which it was necessary to perforate the after-coming head in order to deliver. The third case was one of spina-bifida.

I have grouped these cases to show the field of the application of version in the different obstetrical complications. In cases of mal-position there is a considerable saving of labor.

## A MODERN APPLICATION OF VERSION\*

By HUGH C McDOWELL, M D,

BUFFALO N Y

THE operative practice of the obstetrics has been limited in the past to certain routine operative procedures. The foremost being the use of forceps, the advantages and disadvantages of which are well known, secondly, the major operation of Caesarian section which has its limited field.

Within the last ten years there has been brought forth by Dr Potter and placed in prominence an operative procedure previously known but not generally applied, and that is the obstetrical operation of version. The technique which he has developed and uses as his armamentarium is the one that is being followed by many who routinely or occasionally make use of this operative procedure. In this series of cases this method was employed, a short description of which will be made at this time.

The patient should be prepared in the following manner. After the first stage of labor is completed the perineum is shaved and washed off with sterile water. This may be followed with a one to five thousand lysol solution. The patient should not be given an enema within an hour before delivery, because frequently the contents of the lower bowel will be expelled during delivery. A quart of warm water may be allowed to run into the vagina, washing out any mucous or blood which may be there. The patient after preparation is anesthetized to the surgical degree and the perineum is ironed out manually until the vagina admits the hand readily, the patient having previously been catheterized. The bladder must be empty before any attempt is made at delivery. The perineum and the vagina having been dilated manually, the left hand is introduced into the uterus. The uterine cavity is now explored, the position of the child is noted, the location of placenta is ascertained, the position of the feet and hands should be noted, and if the arms are not folded across the chest they should be placed in that position before going further. That will prevent in elective cases the complication of the extended arm.

Note the position of the cord. Ascertain whether it is around the neck or any one of the extremities. The hand is now further introduced into the uterus between the uterine wall and membrane, care being taken not to rupture the amniotic sac if rupture has not already taken place. As the hand approaches the fundus it comes into contact with one or

more of the lower extremities of the child. Care must be taken at this time to prevent the premature rupture of the amniotic sac. Ascertain the position of the feet. When this is done, the sac may be ruptured high up in order to maintain sufficient amount of amniotic fluid to facilitate the turning of the child. Both feet are brought down together if possible by a grasping of the ankles between the first and second fingers of the operator. Slight traction is made downward and the head is pushed upward from the outside with the right hand. The downward traction is continued until the knees appear at the vulva, when the version is completed. At this stage the anesthetic should be lessened somewhat so that the uterine contractions may assist in the continued rotation of the child's body, thus avoiding too much traction. The buttocks of the child rotates to the hollow of the sacrum, the buttocks being delivered by lifting the feet upward over the symphysis, after which the tension on the anterior foot is increased with a view of bringing the back of the child transversely across the outlet of the mother in contra-distinction to the old method of delivering the hips anterior-posterior. Gentle traction is now made until the scapula and the posterior axillary fold appear and the scapula is free from under the symphysis pubis. With the index finger of left hand pressure is applied upward on the spine of the scapula or in the posterior axillary fold with a resulting rotation of the shoulder under the symphysis pubis and the delivery of the child's arm and forearm are accomplished. The body is now rotated until the other shoulder appears under the pubic arch. No traction is made upon the arms themselves and there will be necessity in grasping them in order to effect their delivery. With the arms free it is now necessary to see that the head is fully flexed and this flexion should be maintained by following the head downward with gentle pressure over the occiput, through the abdominal wall with the free right hand. The abdomen and chest of the child are now resting on the operator's left forearm. The index finger of the left hand is now inserted into the mouth of the child and pressure exerted above upon the occiput, bringing down the flexed head to the perineum, with the neck of the child under the symphysis and the mouth delivered. One may ordinarily take as much time as necessary to deliver the after-coming head. With the mouth of the child delivered the child can now breathe and by stroking the trachea gently

\* Read at the Annual Meeting of the Medical Society of the State of New York Rochester, April 22, 1924

previa This is done as a routine in these type of cases

The period of involution was considerably shortened, as shown by the lessening of the vaginal discharge

The foetal mortality consisted of two still-born monsters and three cases known to be alive before delivery, the cause of death in the latter being due to a torn tentorium as revealed by post-mortem One case of spina bifida, which lived five days and died from sepsis

None of these cases had any fractures of the extremities or fracture of the skulls

In this series of cases twenty were seen in consultation either on hospital services or outside and had been previously examined or attempts made at delivery.

It has been my privilege to briefly outline my conception of the Potter version and its various indications in the hope that you may extend the application of this procedure

## THROMBOSIS OF THE RETINAL VEINS

By MACY L LERNER, M D, M MED SC,  
ROCHESTER, N Y

**T**HERE is still room for investigation as to the real etiology of this affection, as there is no means of distinguishing clinically what lesion is present in any given case. Although it is nearly forty years since V Michel published the first case, there is still need for collection of fresh material"

These words were sounded recently by such well known men in ophthalmology as Edward Jackson and Alan Greenwood Dr Jackson's plea for recording additional cases of this group of affections stimulated me to report my case and review some aspects of this important subject

Three possible factors may be considered in the production of thrombosis of the retinal veins

- 1 Infection, either bacterial or possibly a toxin bacterial in character or a product of metabolic changes

- 2 Change in the vessel wall favoring thrombus formation

- 3 Alteration of the blood elements

- 4 Combination of any of these conditions

*Etiology*—These cases occur usually in elderly people Among 60,000 patients in Haab's clinic there were 20 cases of thrombosis of the main venous system, of whom 15 were between the ages of 50 and 80 years

There is evidence of widespread vascular disease The peripheral vessels are thickened, cardiac hypertrophy is associated and in many of these patients nephritis is present It seems, therefore, probable that the wall of the central retinal vein is thickened, possibly obliterated, from an endarteritis or maybe a thrombus is lodged in its lumen

We must keep in mind that infection or toxemias during a life time may hasten all these changes in the vessel wall and therefore we must always look for the infectious origin

Influenza seems to be a factor in favoring thrombosis of the retinal veins Jackson's cases were probably due to the influenzal infection Leyden and Gutman, among 186 cases of influenza presenting ocular lesions, classified 32 per cent as retinal lesions and 27 as glaucoma The latter must have followed the thrombosis of the central retinal vein

Focal infection undoubtedly plays an important part in many of these cases of thrombosis of obscure origin Hillard Wood believes that focal infection from the tonsils or sinuses may explain many cases of thrombosis of the retinal veins His case had no evidence of any vascular changes in the body nor in the eye

According to F A Williamson, a toxic influence is responsible for the thrombosis of the vessels He believes this toxin acts on the delicate macular choroidal capillaries, causing degeneration of their walls and in this way increasing permeability to fluid and consequent edema The fluid then diffuses or osmoses through into the potential space between the rods and cones and the pigment epithelium, preventing the access of nutrient materials from the choreocapillaries, so that the adjacent retina degenerates and forms a hole This explains the association of a hole in the macula with thrombosis of the veins in the same case.

Frost mentions stagnation of the blood current as a cause of thrombosis, phlebitis extending from the orbital veins is also given as a cause

Heart disease is considered as a cause by Haab, because he believes that it tends to produce early arteriosclerosis Hard and strenuous work in a stooping posture favor in the production of the affection All Haab's cases were peasants who engaged in hard work

The most important fact in the production of thrombosis of the retinal veins is probably that simultaneously with general or local arteriosclerosis, the circulation of the eye is disturbed

\* Read at the Annual Meeting of the Medical Society of the State of New York Rochester April 22, 1924

for the mother when this procedure is used. It is the operation of choice where there is a prolapse of the hand or where the hand is encountered alongside the head. In delivering these cases one should be sure to replace the hand upward and fold it across the chest before an attempt at version is made, thus avoiding an extension of one or both arms.

In face presentations the majority of the cases are extremely difficult to convert into an occiput. One can more readily push the head out of the pelvis and do a version.

In transverse presentation the better method is in bringing down the feet. A procedure which I have tried recently in several cases where the back was anterior was to place the hand along the back of the neck and push the child upward into the fundus until the feet presented the inlet. The hand is then released from the occiput and brought down until it encounters the feet and extraction is performed in the usual manner. With the back of the child posterior the procedure of obtaining the feet is much less difficult.

*Cardiac Cases*—Where compensation is not broken cardiac lesions occurring in pregnant women should not be a counter-indication to this procedure. These patients tolerate an anesthetic with a short delivery more readily than they do a long labor without an anesthetic. Three of these cases were given a chloroform anesthetic, one case being that of a mitral-stenosis. I have one case which had a complete heart block which was given an anesthetic at the time of delivery, although she was not delivered by version. (How was she delivered?)

Pendulous abdomen is occasionally encountered in the primiparae. But more frequently we see it in those women who have borne a large number of children. In the latter type there is usually a history of increasing difficulty at each child-birth. We find that these cases have a long first stage without any engagement. They are particularly the type of case that is helped by a version.

In the placenta-previa cases delivery should not be attempted until the cervix is completely dilated, the reason being that a tear of the cervix in these cases is more or less serious. The method of dilation may be either by the use of the Champederives balloon or by packing the cervix with gauze. After the complete dilation the hand is introduced between the placenta and the lower uterine segment gently peeling the placenta from its attachment, until it is completely freed. It is then delivered and the hand is re-introduced into the uterus and the version and the extraction of the child performed. I believe that with the stripping off of the placenta first and the subsequent

delivery of the child, that there is less blood lost and the birth canal is not obstructed by the placenta. A live child may be delivered with the placental circulation shut off for a considerable time.

I have left the discussion of the contracted pelvis for the last because this type of case usually gives us our greatest trouble. Often we have an early rupture of the membranes with escape of the amniotic fluid. The rupture of the membranes should not be a counter-indication in doing a version. The only advantage that the retained fluid has is in facilitating the turning of the child. In the contracted pelvis, version is indicated except in the extreme flat or funnel type. The generally contracted pelvis affords a delivery more readily with an after-coming head than an on-coming head providing the disproportion is not too great. Three of the cases of contracted pelvis were primiparae with an external conjugate of seventeen centimeters or in one case where it was necessary to apply less. They afforded no difficulties excepting the forceps on the after-coming head. It is reasonable to suppose that the POTTER VERSION has a distinct advantage in this group and particularly in those of the border-line type. In certain types of rachitic pelvis one may more readily bring the after-coming head through the diagonal conjugate than the on-coming head.

For every procedure there must be some contra-indications, and in the case of version the following are noted:

- (1) A generally contracted and a flat pelvis with a large child.
- (2) Uterus in the stage of tetany tightly contracted around the child with the membranes ruptured and fluid drained away.
- (3) Bandl's ring present which is tightly contracted and does not relax under surgical anesthesia. This rarely occurs in the lecture version.
- (4) A long cervix which encircles the head and does not thin out during labor.

It is highly important that every operator have his own assistant for administering the anesthetic.

*Conclusions*—In this series of cases there was no maternal mortality and the maternal morbidity was less than twelve per cent.

The lacerations of the maternal soft parts consisted of two cases of second degree tear that were repaired and three cases with abrasions which did not need suturing. There were no cases of third degree laceration.

One case showed surgical shock, for which treatment was necessary. The uterus was packed in six cases. These were all placenta

fortable thirteen inch or reading distance Urine report Acid sp gr 1015, no albumin, no sugar, sed neg Blood chem Total nonprotein, N 300 mg %, blood sugar, 012 Wasserman negative Nose and throat Tonsils were embedded but clear No evidence of infection in nose Ear drums were retracted X-ray of sinuses were negative Blood count 3,700,000 reds, 3,600 whites, 91% hemoglobin, color index, 1.2, neutrophils, 76, lymphocytes, 22, large mononuclears, 2 There was slight anisocytosis, otherwise the red cells appeared normal

*Physical Examination*—Chest symmetrical and emphysematous No rales present Heart slightly enlarged and sounded somewhat weak No murmurs Abdomen did not show anything abnormal Extremities showed varicosities on both legs

July 9th—O D Vision Counts fingers at 25 inches Disk made out plainly Margins clearing up Hemorrhages absorbed in many places except in the inferotemporal region where they still have a flame-shaped appearance Veins still very tortuous and engorged

July 23d—Disk outlined fairly well and margins could be made out distinctly for the first time Hemorrhages throughout on the temporal side including macular region, while the nasal side has cleared up completely

August 6th—Vision Counts fingers Tension slightly increased about +1 Nerve head round well outlined Color grayish white Central cupping present Few hemorrhages in the periphery, a few deep hemorrhages in the macular region

September 21st.—Patient complained of sharp pain in right eye radiating to right temple and forehead and to nose Examination showed a very congested eyeball, no ciliary injection Anterior chamber shallow Cornea steamy Pupil oval and moderately dilated Reacts to light very sluggishly Tension by finger about +++ Vision can make out flash lights at two inches Ophthalmoscopically Fundus unobtainable Diagnosis Acute congestive glaucoma, secondary to thrombosis of retinal vein She was given eserine sulphate gr I to 1 oz gtt 1 q 1 hr, sod salicylate, gr 5 q 3 hr and ordered hot compresses Six hours later pupil was contracted, but pain did not subside Tension registered by McLean was 100

September 22d—Pupil contracted Tension same Iridectomy was suggested for relief of pain, but not promising any sight Also explained to patient that enucleation may be the only relief if eye remains painful Patient welcomed the latter and did not care for palliative surgery Enucleation was done under general anaesthesia Specimen forwarded to Army and Navy Medical Museum where it was sectioned and then sent to Dr Verhoff of Boston for further study and confirmation His report follows

*Pathological Report*—The specimens for examination consist of two horizontal sections of the globe, one of which includes the optic nerve The cornea is normal The anterior chamber is obliterated, the iris being compressed against the cornea by the lens, which is in contact with the cornea in the pupillary area The iris shows fibrosis and ectropion uveae The ciliary processes have undergone hyaline change The lens shows slight cataractous changes in the peripheral cortex The vitreous is markedly infiltrated with serum The retina and choroid are greatly compressed as a result of imperfect fixation The retina shows numerous punctate hemorrhages and contains here and there endothelial cells filled with blood pigment. The blood stains poorly, so there were probably more hemorrhages than are apparent in the section There is only slight edema in the retina The retinal ganglion cells are well preserved in the macular region The retinal vessels show marked sclerosis The optic disc shows very slight cupping On the surface of the disc there are actively proliferating capillaries The central retinal vessels are seen cut longitudinally The artery is practically normal The central vein shows endophlebitis of long duration with subendothelial proliferation of connective tissue In the longitudinal section it is impossible to tell whether or not it was completely obstructed by the proliferation, but apparently it was completely obstructed just behind the lamina cribrosa The optic nerve and disc show active neuroglia proliferation with beginning formation of cavernous spaces

Diagnosis Complete obstruction of central vein due to endophlebitis Marked secondary glaucoma

Thrombosis of the veins in the young is rare, and when it does occur, it is very difficult to explain. Wagenmann considers hemorrhagic retinitis and glaucoma as independent of one another but are both dependent on a common cause—arteriosclerosis, the vascular changes which in the posterior half of the eye resulted in hemorrhages, in the anterior half of the eye resulted in impaired drainage and glaucoma

V Graefe observed 22 cases in which glaucoma followed upon hemorrhagic retinitis In the cases of Weinbaum, Purtscher and Würdemann in which hemorrhagic retinitis followed by glaucoma occurred in young patients Since these could not have been due to angiosclerosis they must undoubtedly be looked upon as a sequel of the retinal hemorrhages

According to Jackson, in most of these cases of thrombosis of the retinal veins the arteries are also involved When it comes to prognosis a distinction must be drawn between the cases that are essentially obstruction of the artery or its branches and those that are obstruction of the central vein and its branches The blood current

and to this is added a weak cardiac action that favors venous thrombosis. My patient, I believe, belongs to this group of cases as her symptoms of cramps in her legs were present for a number of years and she also has evidence of myocarditis with hypertrophy.

"Without simultaneous arteriosclerosis, thrombosis of the retinal veins seems out rarely to occur."—Norris and Oliver

**Diagnosis**—There are a number of points of importance in making a diagnosis of thrombosis of the central retinal vein.

- 1 Arteries—caliber normal or slightly diminished
- 2 Veins are tortuous
- 3 Veins are turgid and appear interrupted from being buried in the retina
- 4 Venous pulsation on pressure
- 5 Extensive retinal hemorrhages

The striking feature in thrombosis of the vein is that the blood usually extravasates into the fiber layer and is mostly around the disk over an area having a radius of about two disk diameters. Towards the periphery there are numerous hemorrhages, but they tend to be more scattered.

**Pathology**—I will summarize briefly the pathological changes put forward by most authorities on this subject in explanation of the clinical picture of thrombosis of the central retinal vein.

- 1 Thrombus in the central retinal vein (It was found in 11 out of 22 cases)
- 2 Occlusion of the central vein by proliferation of the intima but without thrombosis
- 3 Multiple thrombi in the retinal veins, but without a thrombus in the central vein
- 4 Multiple emboli or perhaps thrombi in the retinal arteries
- 5 Changes in the retinal vessels, hyaline thickening, endarteritis endophlebitis, sometimes amounting to occlusion, but not the result of either thrombosis or embolism
- 6 Hemorrhage into the substance of the optic nerve

Usually the favorite seat for the lodgment of thrombi is either at the lamina cribrosa or a short distance behind it. The place where the central vein makes its exit from the nerve is also stated by V. Michel to be a favorite place from the obliquity of the course of the vessel in this position.

With all these explanations as to the pathology of thrombosis of the retinal veins we cannot explain yet many cases either clinically nor at sections. Coates, in one of his cases, cut the eye in serial sections transverse to the nerve and stated "at no point is the vein completely obliterated, nor is any laminated or organized thrombus to be found within it."

**Report of Case**—A D, age 69, widow

**Family History**—Father died from old age, mother from post-operative peritonitis, husband died from apoplexy, has two living daughters who are in good health. No history of miscarriages.

**Past History**—Does not recall any infectious diseases, was operated upon for hemorrhoids twice and has had all her teeth extracted.

**Present Trouble**—May 14, 1923, patient complained that she could not see well with right eye, has worn glasses for six years without having them tested during this period, attributing her poor vision therefore to the glasses. She also complains of a sensation as if the blood were rushing to her head, has had many spells of dizziness, and fainting attacks are of common occurrence. Another distressing symptom elicited in the history was cramps in the calves of the legs.

**Vision**—O D Without glasses, 6/60; with glasses, 6/30. O S Without glasses, 6/9+2, with glasses, 6/9+2. External adnexa did not show anything abnormal. Tension was normal in both eyes by palpation.

**Ophthalmoscopically**—O D Media showed fine vitreous opacities, disk margins were poorly outlined. There was central physiological cupping. Numerous flame shaped hemorrhages were observed in the retina along the course of the vessels. Arteries appeared considerably narrower in proportion to veins, the latter being tortuous and engorged. In many places there was practically obliteration of the arteries. O, S, Media clear. Nerve head well defined with central physiological cupping. Arteries narrower in proportion to veins and pressing hard upon latter at crossings. No lesions were observed in the macula or periphery.

May 21, 1923—Right eye showed same picture as described above. Arteries practically obliterated.

May 28th—Flame-shaped hemorrhages more numerous. Veins much engorged and interrupted by edema at places. Disk margins more obscured. Fresh hemorrhages seen.

June 1st—Entire fundus hemorrhagic. Veins more tortuous and engorged near the papilla, their further course hidden and buried in the edematous tissue. Arteries could not be made out. At the place where the disk is supposed to be there is a small whitish area from which the engorged veins appear to emerge, the whitish area evidently pointing to the existing physiological cupping. Left eye showed clear media and a few degenerative punctate exudates in the macular region. Nerve head was somewhat grayish and arteries showed moderate sclerosis.

June 8th—Vision in right eye, counts fingers at nine inches. Left eye + 50 sph + 50 cyl X 180 V 6/6. Add + 300 for near, gave com-

These are anatomical operations, where the patient was operated upon repeatedly on the same region, it is not indicated. The actual number of operations which these patients underwent is really much greater.

The futility of nose and throat operations is clearly indicated, as none of the operated cases benefited.

It is rarely that a patient who suffers from any form of allergy such as asthma, hay-fever, eczema, hives, angio-neurotic-oedema, migraine, frequency, etc., but who at one time or other presents gastro-intestinal symptoms, such as abdominal pain, cramps, distention, nausea, vomiting, diarrhea, constipation, etc.

Table II shows the various combinations of the different forms of allergy as they occurred in our series of 300 consecutive office patients.

TABLE II		Allergy of the			
	No Cases	Asthma	Hay Fever	gastro-intestinal tract	Allergy of the skin
Asthma	237		56	49	59
Hay-Fever	82	56		33	26
Allergy of G I Tract	95	49	33		59
Allergy of Skin	104	59	26	59	
Asthma only—118					
Hay-Fever only—6					
Allergy G I Tract only—11					
Allergy of Skin only—4					

From this table it may be readily seen that the various forms of allergy such as asthma, hay-fever, skin and gastro-intestinal manifestations rarely occur alone, but usually in combination with the other forms. The underlying disease is allergy.<sup>2</sup>

Usually these patients give a definite history that during an attack of asthma they have cramps, abdominal pain, diarrhea, nausea or vomiting. Milk frequently gives these patients loose bowels. The temperature as a rule is normal, and when increased is but slightly so. These symptoms are of allergic origin,<sup>3</sup> and may precede, accompany or follow the above mentioned manifestations. On the other hand, they may occur by themselves.

It is evident that these same symptoms are also quite frequently the symptoms of appendicitis. These cases are very often diagnosed not only as chronic but sometimes even as acute appendicitis. The physician urges appendectomy, and a good number are actually operated. Out of 300 cases of allergy, 17, or 6 per cent, had appendectomy performed. Twenty-nine out of sixty other cases had marked tenderness over McBurney's point and were advised appendectomy, but refused. None of the 17 cases were benefited by the appendectomy. Six per cent of appendectomy in allergy is a higher incidence than is found in other diseases. Since none of them were helped by appendectomy, it is perhaps safe to account for them on the ground of mistaken diagnosis.

In order to obtain successful results in these cases of gastro-intestinal allergy, the procedure is not appendectomy but entirely different. You must treat these cases the same as you would any other form of allergy, such as asthma, hay-fever, etc., ascertaining by skin tests what produces the symptoms, and remove the allergin, or if this is impossible, desensitize the patient. The allergic agent in these cases is nearly always a food. The following is one out of many typical cases of gastro-intestinal allergy, who has been repeatedly advised appendectomy, absolutely cured by following the principles mentioned above.

E G, female, 9½ years of age, was suffering for the last 7½ years from severe abdominal pain, aggravated by eating. She was nauseated and vomited when the pain was severe. Constipation was marked. The above symptoms were getting worse, and for the past six months she suffered daily attacks of severe abdominal pain. She has frontal headaches, chilliness, and frequency in urination. Previous history. She had measles, chicken-pox, suffered frequently from colds, itching of eyes, hives, attacks of diarrhea, with mucous in stools, had tonsils, adenoids, and large cervical glands removed, suffered from enuresis until 1½ years ago. Family history. Father was suffering for years from diarrhea, skin troubles. One aunt had bronchial asthma, another psoriasis, and cousins, skin disease and gastro-intestinal allergy. On physical examination everything was negative with the exception of a diffusely tender abdomen, which was especially marked over McBurney's point, there was no rigidity. Appendectomy had been repeatedly advised as the only means of relief. Skin tests revealed strongly positive reactions to peas, barley and rice, weakly positive to eggs, potatoes, cheese, salmon, veal and beef.

**Discussion**—This patient was repeatedly urged to undergo appendectomy. She was freed from all symptoms immediately, the moment allergic foods were eliminated from the diet, and has remained so for the last 2½ years. The presence of the earmarks of allergy in the patient and in the family history, and the absence of abdominal rigidity are great aids in diagnosing these cases.

Rectal hemorrhage is cited as a rare occurrence in appendicitis. Recently I have described blood in the feces and gastric contents as not an infrequent finding in all forms of allergy.<sup>4</sup> This is in accordance with the canine anaphylactic experimental work of Mannwaring<sup>5</sup> who found from slight to very profuse intestinal bleeding. The following allergic patient presented profuse rectal hemorrhage for which appendectomy was performed, but nothing but a congested appendix was found.

G Y, 43 years of age, weighing 157 lbs, suffered for years from abdominal pain, belching,

in the artery carries the obstruction from the arterial wall through the larger lumen into the smaller, increasing the obstruction. In the vein, the blood current carries the obstruction away from the smaller vessels to the larger, and therefore, there is a better chance for partial or complete recovery. Dr Jackson mentions two cases under his care which made good recoveries, one regaining standard vision and the other 20/100.

Dr Arnold Knapp states in his discussion of Dr Greenwood's paper on this subject, that many conditions with a different pathology are grouped under the clinical picture of thrombosis of the retinal veins. Most of his cases examined after enucleation showed an endophlebitic process. Cases where a complete recovery occurred seem to me to belong to some other classification than thrombosis. This view is held by such well known pathologists as Feingold. Massage of the eyeball, nitrites and other treatment would be useless in pure cases of thrombosis where endophlebitic changes are existing.

#### CONCLUSIONS

1 Thrombosis of the retinal veins should not be confounded with other hemorrhagic affections of the retina.

2 Thrombosis of the retinal vein is due unquestionably to some definite etiology not established yet.

3 Infection must play a part in producing thrombosis of the retinal vessels in a patient whose vascular system shows sclerotic changes.

4 Cases that are classed as thrombosis of the retinal veins and reported as recovered as to vision and integrity of the eye should be carefully studied as to whether they do not belong to some other group of diseases of the eye.

5 This subject should be given more stimulus as far as reporting cases of this nature and study of its pathology.

## APPENDICITIS IN 300 CASES OF ASTHMA AND OTHER FORMS OF ALLERGY

WILLIAM LINTZ, M D

BROOKLYN, N Y

The diagnosis of chronic appendicitis is still shrouded with obscurity and the results of treatments, both medical and surgical, are unsatisfactory. Charles Gibson has recently published the results for six years of chronic appendicitis operations in the New York Hospital. The number of unsatisfactory results amounted to 30 per cent. Very frequently a diagnosis of chronic appendicitis is made without considering the grounds to justify such a conclusion. These cases as a class are very poorly worked up. In a recent study of 58 patients out of 700 who complained of gastro-intestinal symptoms, unrelieved by appendectomies, who were operated upon by surgeons generally and not in any one hospital, Barclay and MacWilliams<sup>1</sup> have demonstrated

that a more thorough study before operation would have spared these patients unavailing surgery. Therefore, any light that can be shed on this subject needs no apology for its introduction.

In a study of 300 consecutive office patients suffering from allergy, I find that as a class they are operated upon more than any other class of individuals, some of the members of this group were operated upon as high as thirteen times (I prefer the term allergy, rather than anaphylaxis, because the former terminology indicates the inherited character of the condition, while the term anaphylaxis does not imply this).

Table No I shows those operated out of our series of 300 consecutive cases.

TABLE I

	Total No of Cases	300
Operations performed —		Throat, tonsils, adenoids
Appendectomy	17	Nose
Miscellaneous	29	Angio-Neurotic-Oedema
Female generative organs	13	
Total number anatomical operations	121, or 40%	Combined operations
Total number patients operated upon	104 or 34.4%

## DRUGLESS THERAPY

Those who have seen the inner workings of the Albany headquarters of the Committee on Legislation of the Medical Society of the State of New York are deeply impressed with the flood of healing cultism that threatens to overwhelm the Legislature at every session. The Committee on Legislation stands at the neck of the funnel through which passes every form of cult for curing human ills—and there are at least fifty-five varieties of them, according to an official list published on page 230 of the February 22, 1924, issue of this Journal.

There are many periodicals published by the cult practitioners. We printed a series of studies in Chiropractic periodic literature in this Journal during 1924, and supposed that no system could

be less scientific. But, while the chiropractic system is based on a principle which is at least logical, there are other cults in whose basis of ridiculousness there is no room for logic.

There must be numerous followers of the fifty-five varieties of "pathies" and cults, for many of them have national organizations, who hold conventions and have pictures taken of their members sitting at banquet tables in evening clothes. When a conscientious physician sees the stacks of literature of these cults he gets an idea of the immensity of the task which confronts the committee on Legislation of the Medical Society of the State of New York.

We were interested in one of the periodicals which promotes the drugless therapy bill which

nausea, and vomiting, cramps and burning in the abdomen. She suffered from rheumatism, severe headache, frequency and weakness. On four different occasions she had had profuse bleeding of bright red blood from the rectum. Mother had bronchitis and coughed all her life. Has three children, one is suffering from bronchial asthma, another from frequent diarrhea, and a third is weak minded, has diarrhea and bloody stools. Her husband is perfectly well. On physical examination she showed slight abdominal tenderness especially over McBurney's point, no hemorrhoids or fissures. Proctoscopic examination was absolutely negative. A gastric analysis showed a subacidity, otherwise it was negative. An X-ray examination pointed to inflammation of the gall bladder, everything else was negative. She was operated upon, the gall bladder and all the other organs were found perfectly normal and a congested appendix was removed. The pre-operative diagnosis was chronic appendicitis.

*Discussion of Case*—Four years after the operation the patient still has gastro-intestinal symptoms, although no more rectal bleeding has occurred. In view of the negative abdominal pathology, after a complete exploratory laparotomy, to account for the intestinal bleeding, the continuance of the gastro-intestinal symptoms after appendectomy, the definite allergic history, it is safe to conclude that the bleeding most probably came from the appendix, but was allergic rather than inflammatory in nature, since the appendix merely was congested. I have seen another patient with profuse rectal bleeding, where allergy was apparently the established cause, X-rays, gastric and feces examinations and all the other clinical investigations were all negative. She was helped by treatment along anaphylactic principles. Having benefited by the experience of the first patient, I did not subject her to an appendectomy.

May it not be wise to look out for allergy as the real cause when rectal bleeding is a prominent symptom of appendicitis? If rectal hemorrhage is caused by appendicitis we have a right to expect it more often.

#### DISCUSSION AND CONCLUSION

In allergic patients, before diagnosing appendicitis and resorting to appendectomy, one has to rule out anaphylaxis as the true etiology, a condition hardly thought of in connection with appendicitis. When there is a continuance of the symptoms for which appendectomy was resorted, anaphylaxis should be thought of. Even anaphylactic patients may temporarily be improved following appendectomy, but this is due rather to the restriction of the allergic food, than to the operation. The change produced in the autonomic nervous system as the result of the operation may also be a factor in the improvement.<sup>6</sup> Even the finding of a chronic pathological appendix in the

anaphylactic patients, does not necessarily mean that an operation was justified. As a result of an extensive pathological experience, I found that a normal appendix anatomically speaking, is a great rarity. In this condition it is interesting to note the experience of Williams and Slater<sup>7</sup>, who found that one-third of all women operated upon for pelvic condition, shows pathological lesions in the appendix, without ever having had clinical symptoms referable to the appendix. These patients very frequently develop all kinds of skin rashes, from obscure causes, before they leave the hospital after their appendectomy operation. A tender McBurney is a very frequent finding and means nothing in these allergic patients, no matter how prominent the gastro-intestinal symptoms and the abdominal tenderness may be. I find the absence of abdominal rigidity is a constant and reliable sign in these cases and contra-indicates operations. Theoretically, eosinophilia should be a great help, but practically I rarely find it. No class of cases are operated upon so much. No class of cases are benefited so little by these operations. I find that when appendicitis runs in families that the true condition is really one of gastro-intestinal allergy.<sup>8,9</sup> Allergy is a distinctly familial and inherited disease. Asthma, hay-fever, allergy of the skin, and gastro-intestinal tract, etc., are in reality not diseases per se. They are only manifestations of the underlying disease called allergy. These manifestations rarely occur singly, but usually in combination with the other forms. If these various forms of allergy are not present in combination at any one time, they are sure to occur later in the course of the life of the individual who suffers from allergy. Rectal bleeding may be allergic in origin.

In patients with indigestion and right-sided abdominal pain, allergy should be ruled out.

# LEGAL

By **GEORGE W. WHITESIDE, Esq**  
Counsel, Medical Society of the State of New York

## OBJECTIONS TO RE-REGISTRATION CONSIDERED

As early as 1760 a license to practice physic and surgery in the City of New York was required of any practitioner "after due examination of his learning and skill in physick or surgery," although those who had practiced prior thereto were not required to undergo such examination

In 1792, a further licensing act was passed forbidding the practice of medicine to those who had not served an apprenticeship of two years with another physician or graduated from a college in the United States, or who had not successfully passed an examination by the constituted authorities and received a certificate accordingly. From this act likewise were exempted those who had previously practiced

In the first act referred to, the purpose of these licensing laws was set forth in a preamble to the act as follows

"Whereas many ignorant and unskilled Persons in Physik and Surgery in order to gain a Subsistence do take upon themselves to administer Physik and practice Surgery in the City of New York to the endangering of the Lives and Limbs of their Patients, and many poor and ignorant Persons inhabiting the said City who have been persuaded to become their Patients have been great Sufferers thereby "

It will be seen at once that as early as 1760 the licensing statute declared that the purpose of licensure was for the protection of the public against those who were unqualified and who sought for their selfish gain to practice medicine

In 1797 a state-wide licensing act was passed requiring practitioners to obtain from the magistrate or officer before whom proof of qualification had been given a certificate and to file it in the office of the clerk of the county of his residence

In 1801, further restrictions and qualifications were required, and registry with the county clerk continued as a prerequisite to a right to practice. Up to this time the judges of qualification were the Chancellor, a judge of the Supreme Court, a Master in Chancery or one of the judges of the Court of Common Pleas

In 1806, when the charter of the Medical Societies was passed, they were empowered by that act to examine students and give diplomas to practice physic or surgery and the charter by its terms repealed the previous licensing statutes. In this act no requirements of registration in

the county clerk's office appear. The Medical Societies continued to exercise this power of licensure for many years and by an act in 1880, all future licenses were to be issued after examination by the regents, and all physicians then licensed or who should thereafter be licensed to practice were required to register in the office of the county clerk

In 1887, a comprehensive medical practice act was passed and the standards of licensure were raised and registration in the county clerk's office was continued as a requisite to practice. The licensing power of the State Society was specifically repealed. All subsequent amendments to the Medical Practice Act contained the requirement of registration in the county clerk's office

We thus see that from 1797 to 1806 registration in the county clerk's office was required. From 1806 to 1880 that requirement was dispensed with. So that registration in the county clerk's office has been going on continuously for the last forty-five years. Practically all of the men who registered in 1880 and were then thirty-five years of age or over, are now dead. Almost all of those who were then thirty years of age are now dead, and a large majority of those who were twenty-five years of age at that time are now dead. A vast majority of those who registered before 1890 are either retired or dead, and those who registered after 1890 are practitioners who have been in practice thirty-five years. Of those who have been so registered since 1890, there has been a considerable normal death rate. It is fair, therefore, to assume that the lists in the county clerk's offices contain the names of more dead men than those who are alive today. The names of those who have been convicted of felony in whose cases there has not been definite action by the regents are likewise retained on the lists in the county clerk's office as qualified practitioners, those who have removed from the state are still upon the lists, those who have gone into other businesses or professions and abandoned the practice of medicine are still on the lists. There is no way by which one can tell from the list of practitioners in the county clerk's office, who at present are within the state or without the state, retired, active, dead or alive. There is no way by which this can be checked up except by a laborious and impractical method of personal canvass of the present licensed practitioners, and in order to make certain it would be necessary to canvass

is printed on page 232 of the February 13 issue of this Journal. This periodical seems to have a kindly feeling toward all systems of healing except that of scientific medicine, and it seldom indulges in abuse of physicians. About the worst roast of the doctors is an account of a jubilation meeting of chiropractors over a decision against a New Jersey physician who had called osteopaths and chiropractors "Quacks and Fakirs." It rather exalts the virtues of herbs and diet, and the simple life. It seems to mother old forsaken systems like barefoot walking in the dew, and the use of herb teas. It even prints several pages of diseases and the various herbs which are "good for" those conditions. It would throw the gates wide open for the practice of any kind of cult, even that of scientific medicine. It is the "clinging vine" type of literature which eventually strangles scientific medicine by its passive weight.

The periodical to which we refer repeats the grave error of appealing to the principle of in-

dividual freedom of choice of a healer, and it proposes the following amendment to the Constitution of the State of Oregon:

"No law shall be passed which deprives any citizen of the inalienable right to employ the physician of his or her choice, or to determine for himself or herself the mode, manner, method, or system which he or she shall use in case of sickness."

One of the strongest of all the appeals of cults is to this false assumption that any Medical Practice Law can prevent any person from seeking relief from any source he wishes. What the law does do is to forbid any person from holding himself out as able and prepared to treat human ills, unless he has conscientiously prepared himself by a course of study of at least four years in a disinterested scientific school. We believe that this point is not generally apprehended and understood, and that physicians should explain it to their legislators. F O

## THE PHYSICIAN AND THE PUBLIC HEALTH NURSE

A wide-spread movement is under way to increase the scope of the work of the public health nurse. Bills are introduced in the legislature authorizing the employment of public health nurses by various governmental agencies, and there is a keen competition among lay organizations, especially those of women, to promote the employment of nurses. All this is excellent and shows that people are getting ready to support measures for raising the standards of health in a community. But in all the discussion there is lacking an appreciation of the influence of the local physicians in public health matters as distinguished from their treatment of individual cases of sickness.

It is a mystery why lay organizations which promote public health persist in ignoring the practising physicians of their communities. A great criticism of public health nursing is that the nurses diagnose and treat cases of sickness. While it is true that the cases which most nurses diagnose and treat are mild and are those which a physician does not usually care to visit, yet who shall draw the line?

The borderline cases are those over which misunderstandings occur between physicians and nurses. A simple method for preventing these disputes would be that the nurse be directed by a committee of physicians to whom a list of cases visited by the nurse should be submitted. Physicians in rural places and even in the smaller cities are pretty well acquainted with the people of the

communities and can usually tell whether or not a nurse is overstepping her privileges in any particular case. At any rate, the responsibility for the visitations would lie with the Committee of the physicians' own choosing.

While most laws for public health nursing very properly recognize the health officer as a director, or at least advisor, of the nurse, the provision does not go far enough. The health officer is one of the practising physicians of a community but he does not represent the schools, or the industrial establishments, and he often has little to say regarding prenatal clinics and in fact welfare stations. The health officer's chief field is in epidemics of communicable diseases, but even here he is dependent on the practising physicians of his community.

We have often stated in our editorial columns that physicians generally are ready to co-operate with any agency, lay or official, for the promotion of public health. We have not been criticized or corrected in this statement, but on the other hand we have received evidences and assurances that physicians generally are ready to co-operate in public health nursing through their organized societies.

We believe that the proper committee to direct the professional activities of a public health nurse should consist of the health officer and the school physician, and two or three other physicians.

# LEGAL

By GEORGE W. WHITESIDE, Esq.  
Counsel, Medical Society of the State of New York

## OBJECTIONS TO RE-REGISTRATION CONSIDERED

As early as 1760 a license to practice physic and surgery in the City of New York was required of any practitioner "after due examination of his learning and skill in physick or surgery," although those who had practiced prior thereto were not required to undergo such examination.

In 1792, a further licensing act was passed forbidding the practice of medicine to those who had not served an apprenticeship of two years with another physician or graduated from a college in the United States, or who had not successfully passed an examination by the constituted authorities and received a certificate accordingly. From this act likewise were exempted those who had previously practiced.

In the first act referred to, the purpose of these licensing laws was set forth in a preamble to the act as follows:

"Whereas many ignorant and unskilled Persons in Physik and Surgery in order to gain a Subsistence do take upon themselves to administer Physik and practice Surgery in the City of New York to the endangering of the Lives and Limbs of their Patients, and many poor and ignorant Persons inhabiting the said City who have been persuaded to become their Patients have been great Sufferers thereby."

It will be seen at once that as early as 1760 the licensing statute declared that the purpose of licensure was for the protection of the public against those who were unqualified and who sought for their selfish gain to practice medicine.

In 1797 a state-wide licensing act was passed requiring practitioners to obtain from the magistrate or officer before whom proof of qualification had been given a certificate and to file it in the office of the clerk of the county of his residence.

In 1801, further restrictions and qualifications were required, and registry with the county clerk continued as a prerequisite to a right to practice. Up to this time the judges of qualification were the Chancellor, a judge of the Supreme Court, a Master in Chancery or one of the judges of the Court of Common Pleas.

In 1806, when the charter of the Medical Societies was passed, they were empowered by that act to examine students and give diplomas to practice physic or surgery and the charter by its terms repealed the previous licensing statutes. In this act no requirements of registration in

the county clerk's office appear. The Medical Societies continued to exercise this power of licensure for many years and by an act in 1880, all future licenses were to be issued after examination by the regents, and all physicians then licensed or who should thereafter be licensed to practice were required to register in the office of the county clerk.

In 1887, a comprehensive medical practice act was passed and the standards of licensure were raised and registration in the county clerk's office was continued as a requisite to practice. The licensing power of the State Society was specifically repealed. All subsequent amendments to the Medical Practice Act contained the requirement of registration in the county clerk's office.

We thus see that from 1797 to 1806 registration in the county clerk's office was required. From 1806 to 1880 that requirement was dispensed with. So that registration in the county clerk's office has been going on continuously for the last forty-five years. Practically all of the men who registered in 1880 and were then thirty-five years of age or over, are now dead. Almost all of those who were then thirty years of age are now dead, and a large majority of those who were twenty-five years of age at that time are now dead. A vast majority of those who registered before 1890 are either retired or dead, and those who registered after 1890 are practitioners who have been in practice thirty-five years. Of those who have been so registered since 1890, there has been a considerable normal death rate. It is fair, therefore, to assume that the lists in the county clerk's offices contain the names of more dead men than those who are alive today. The names of those who have been convicted of felony in whose cases there has not been definite action by the regents are likewise retained on the lists in the county clerk's office as qualified practitioners, those who have removed from the state are still upon the lists, those who have gone into other businesses or professions and abandoned the practice of medicine are still on the lists. There is no way by which one can tell from the list of practitioners in the county clerk's office, who at present are within the state or without the state, retired, active, dead or alive. There is no way by which this can be checked up except by a laborious and impractical method of personal canvas of the present licensed practitioners, and in order to make certain it would be necessary to canvas

## THE PHYSICIAN AND THE PUBLIC HEALTH NURSE

A wide-spread movement is under way to increase the scope of the work of the public health nurse. Bills are introduced in the legislature authorizing the employment of public health nurses by various governmental agencies, and there is a keen competition among lay organizations, especially those of women, to promote the employment of nurses. All this is excellent and show that people are getting ready to support measures for raising the standards of health in a community. But in all the discussion there is lacking an appreciation of the influence of the local physicians in public health matters as distinguished from their treatment of individual cases of sickness.

It is a mystery why lay organizations which promote public health persist in ignoring the practising physicians of their communities. A great criticism of public health nursing is that the nurses diagnose and treat cases of sickness. While it is true that the cases which most nurses diagnose and treat are mild and are those which a physician does not usually care to visit, yet who shall draw the line?

The borderline cases are those over which misunderstandings occur between physicians and nurses. A simple method for preventing these disputes would be that the nurse be directed by a committee of physicians to whom a list of cases visited by the nurse should be submitted. Physicians in rural places and even in the smaller cities are pretty well acquainted with the people of the

communities and can usually tell whether or not a nurse is overstepping her privileges in any particular case. At any rate, the responsibility for the visitations would lie with the Committee of the physicians' own choosing.

While most laws for public health nursing very properly recognize the health officer as a director, or at least advisor, of the nurse, the provision does not go far enough. The health officer is one of the practising physicians of a community but he does not represent the schools, or the industrial establishments, and he often has little to say regarding prenatal clinics and in fact welfare stations. The health officer's chief field is in epidemics of communicable diseases, but even here he is dependent on the practising physicians of his community.

We have often stated in our editorial columns that physicians generally are ready to co-operate with any agency, lay or official, for the promotion of public health. We have not been criticized or corrected in this statement, but on the other hand we have received evidences and assurances that physicians generally are ready to co-operate in public health nursing through their organized societies.

We believe that the proper committee to direct the professional activities of a public health nurse should consist of the health officer and the school physician, and two or three other physicians.

F O

prosecute, rather assumes that the District Attorneys of the state have shown in the past commendable zeal in the prosecution of offenders against the Medical Practice Act, whereas the reverse is the fact. The bill places upon the District Attorney the duty to prosecute, but provides likewise that the Attorney General may supersede him, so that the District Attorney is put upon his mettle to do his duty, and if he fails in his duty, it does not mean the failure of a case, because the Attorney General may carry on the prosecution. This gives an added weapon of offense against the illegal practitioner and expands the prosecuting machinery to make it more comprehensive in reaching violators. If this be an objection, we can conceive only of such objection being urged seriously by those who fear this added instrumentality rather than the licensed profession who should welcome this additional aid.

Further objection is made by medical men that "We have a vested interest in our state license as practitioners of medicine which should not be jeopardized by even the color of discretionary power." This objection is based upon an erroneous understanding of the legal effect of a license, it does not create a vested interest, it is subject to legislative control, regulation and even abrogation. It would seem to be folly to assume that a license is something which it is not in order to give the licensee a false sense of security.

The objection that this bill would be "an entering wedge for compulsory health insurance and other forms of state medicine" would be an excellent objection if it were susceptible of proof or if there were sufficient facts upon which to predicate a reasonable suspicion that it is true. How any bill that provides for the first time in forty-five years a proper roll call of the medical profession so as to inform everyone who is a licensed practitioner and which provides excellent machinery for the prosecution of the unlicensed practitioner and adds additional penalties to unlicensed practice, can be deemed "an entering wedge" for state medicine in any form, seems inconceivable. The two propositions have nothing in common.

The further objection that the only good that would be obtained would be to prosecute cults at the cost of great personal inconvenience, ostensibly refers to the inconvenience of annual registration. This inconvenience has been re-

duced to an absolute minimum by providing for registration through the County Societies after the first registration. A dentist came to a town in this state and started to practice. He had a very pleasant personality, joined the local social organizations, athletic clubs, lodges, churches, and made many personal friends among dentists and others, and was well liked. It appears, however, that he was not licensed in this state. No one wished to take personal responsibility of instituting action against him or being identified with any such action. Under the registration act for dentists, a line to the authorities at Albany is all that is necessary to have the authorities undertake the responsibility of investigation and stopping his practice until he should be licensed. This was an actual case. There are many similar cases throughout the state of men practicing medicine and there is no reason why any individual physician should take upon himself the burden of prosecution or any society should take the legal risk of prosecution and the legal liability that flows therefrom. Under the Karle-Dunmore bill, the authorities at Albany would have to assume all such responsibility. The individual doctor need only call their attention to the case to get action. It would seem that relief from this personal responsibility of prosecution and relief of the County Societies from possible liability in undertaking the prosecution is worth a slight personal inconvenience of the individual physician in sending in his registration the first year and having the secretary of his County Society do it for him thereafter.

The only penalty for failure to register under the act is a fee of one dollar for each thirty days of default, for wilful refusal to register one dollar a day for such refusal for the first thirty days and five dollars per day thereafter. So that the doctor who unwittingly omits to register is subject only to a small penalty such as flows from ordinary ordinance violations, such as failing to clear the snow or ice off one's sidewalk and those penalties are made the only penalties that may be imposed therefor and cannot affect the legality of a man's license and, furthermore, they may be remitted or compromised in the discretion of the regents. These penalties do not seem severe and are not comparable with many penalties for violation of city ordinances.

It would seem from an analysis of these objections that they have been met and answered.

practically all the names on the lists, which would be prohibitive in cost and in labor and subject to change each year

On the question of the necessity of registration in such form as to tell accurately year by year those who are authorized to practice, the facts above stated should answer the objections which have been made from certain quarters that the re-registration provision of the Karle-Dunmore bill is "unnecessary, unremedial, uncalled for" and that "our present laws are sufficient," and further answers the objection that "we should reject anything covered by existing laws," and finally, is quite a complete answer to the proposition of opposition "to registration in principle"

Objection that Subdivision "d" of Section 170 of the present law, which makes a ground for revocation of a doctor's license his offering or undertaking to violate Section 1142 of the Penal Law, should be restored to the Karle-Dunmore bill is worthy of consideration. Section 1142 makes it a misdemeanor, among other things, for a doctor to exhibit an article or instrument purporting to be for the prevention of conception or representing that it can be so used "or any such description as will be calculated to lead another to so use or apply such an article." If a physician is charged with this misdemeanor in a criminal proceeding, before he can be convicted, his guilt must be proved beyond a reasonable doubt. After such conviction the regents, under the Karle-Dunmore bill, could undertake a proceeding for the revocation of his license if the crime involved *moral turpitude*. If, on the contrary, the offense were unintentional, they would have no such right of revocation. In this way, a physician is protected against being framed up and his license revoked at the instance of some people whose enmity he may have aroused, whereas if he is really guilty of violating Section 1142, as that section should be construed, his license still may be the subject of attack by the regents under the Karle-Dunmore bill. The provision of the present law, the repeal of which by the Karle-Dunmore bill is objected to, makes possible the revocation of a doctor's license if he has either undertaken in any way or by any means, or has offered by any manner or means to violate the provisions of that section, whether he has been convicted therefor or not. This imposes an unconscionable penalty upon possibly innocent men and is an invitation to the unscrupulous to blackmail the profession. Under the Karle-Dunmore bill, by taking this provision out of the law, the profession is still protected against the unscrupulous doctor who may wilfully violate Section 1142 and be convicted therefor, and is protected against the blackmailer who seeks to injure the profession. It is difficult to understand how medical men can urge the removal of Section 170-d on this subject from

the present law as a ground of objection to the bill. Furthermore, the bill does make a ground of revocation the undertaking in any manner or in any way to procure or perform a criminal abortion whether or not the doctor doing so has been tried and convicted therefor. This gives ample protection against the practice of abortionists.

Further objection is cited that our present laws are sufficient. Our present laws do not seem to be sufficient to prevent people who have never received a degree of doctor or such degree that is recognized in this state, from using that title. Chiropodists use it and in a recent issue of the *Pedic Society Digest*, their counsel, Hon. John G. Dyer, cites instances of chiropodists who have been prosecuted for using the title "Doctor" and been acquitted. The publishers of the chiropodists' paper admit that the title is used by chiropodists, not because they have received such degree, *but because the public has so designated them*. In other words, any class of persons who can get the public to give them a title, under this contention, are entitled to have it and can insist upon it as a right, whether such title is a false pretense or not, if the statute does not specifically prohibit it. The Karle-Dunmore bill specifically does prohibit such use of the title "Doctor" to those who are not entitled to it. Can it be said that our present laws are sufficient when chiropodists who have no right to the use of the title "Doctor," and who have not earned it, who have no degree entitling them to it and who assume it because the public so designate them, cannot be successfully prosecuted therefor? It is said by the objectors that "we should go slowly about any change in the Medical Practice Act." If this chiropodists situation and the present chiropractic usurpation of the title of "Doctor" and the use of the title by all types of cultists who are not entitled to it, weigh for anything, we ought to speed up, rather than slow down, remedial changes in the Medical Practice Act to put a stop to this growing practice against which our present statutes seem ineffective.

The objection that the bill seeks to register the honest physician, but does not register the cults, while emanating from some physicians, expresses the views of the chiropractors. The chiropractors and other cultists would like to be registered and would probably be willing to register, not once a year, but once a week or once a month, to gain official recognition of their cult. Can this objection be urged seriously on the part of those who have consistently fought such recognition of cults? It would appear that this objection would give great courage to the cults in their present efforts to be recognized, particularly when the objection comes from medical sources.

The objection that the Attorney General may deprive the District Attorney of his right to

# CONCERNING DISTRICT LABORATORY SUPPLY BILL

## ASSEMBLY INTRODUCTORY 1167

Your Committee would oppose this amendment for the following reasons

*First* That it is in opposition to the general notion of the service the public laboratory should render

*Second* That it is an attempt to coerce the physician into submitting data concerning his patients, without stating the limitations to which such demands may go. The wording in this section of the bill might admit of considerable abuse of the privilege, were it granted,

*Third* Public health laboratories have been established by communities and financed from public monies, primarily for the purpose of protecting the public against the spread of communicable diseases. To limit their services to patients who are able to pay for such services would defeat its object,

*Fourth* No distinction is made in the character of supplies against which charges shall be made, as to whether they are supplies furnished for diagnostic purposes or therapeutic products,

*Fifth* The amendment is unnecessary, inasmuch as possibly 98 per cent of the physicians are at present submitting the required data when using the supplies for diagnostic purposes

Other reasons for objecting were held by your Committee, but since they have been practically covered in communications we have received from other members of the Society concerning the bill, we shall not repeat them. Excerpts from letters received follow

### FROM THE COUNCIL

1 "I am unalterably opposed to Assembly Bill Introductory No 1167"

2 "I feel that the bill should be opposed by the State Society, it being another distinct effort in the line of centralizing of control of the practice of medicine"

### FROM THE COUNSEL

"This bill requires institutions, physicians and other persons who use supplies distributed by the State Department of Health to furnish clinical data and reports required by the Laboratory of the State Department of Health, or to pay the market price of such supplies

"There appears to be no restriction upon the character or extent of the reports which may be required, so that the State Department of Health could apparently require the disclosure of much confidential and privileged information, as well as place upon the physician that burden of doing a great deal of clerical work for the Department. It appears to be an unjust discrimination against those who may be unable to pay the

market prices and fees for the laboratory services and supplies, in favor of those who are able so to pay, so that the ultimate effect of the bill appears to be that those who are able to pay may escape the disclosure of private and confidential information, while those unable to pay are deprived of the protection of the privilege

"The exercise of the police power of the State through the Department of Health should not place upon those unable to pay a deprivation of the right or privilege or the imposition of a burden from which those who are able to pay are excused

"The bill, therefore, appears to my judgment to be discriminatory and to place upon physicians and surgeons an unreasonable and unnecessary burden"

### FROM THE COMMITTEE ON PUBLIC HEALTH

1 "The only possible excuse for the bill would be based on a desire to prevent waste of laboratory products, in other words, inexcusable expenditure of State money

2 "Such possibility would be more than offset by the sweeping character of that portion of the bill on page 2, which gives to the Commissioner of Health unlimited authority to compel physicians to reveal the histories of their cases, which, if I understand the law, is a violation of the right of privacy of their patients. It may look innocent on the face of it, but it appears to me as fraught with hidden danger

3 "The general operation of the bill would be to strengthen the tendency towards State control of medicine, through the Department of Health. This may be a far cry, but it seems to me to be quite different from the Medical Practice Act, in that it attempts to regulate the private relations between doctors and patients, in matters which have no criminal aspect and should not be spread upon the State records. This may not apply to measles and diphtheria, but it might to the venereal diseases

"If all of the italics, including the eighth line of page 2, could be ablated, I would be in favor of the bill. As it now reads, however, it looks mischievous and should be either defeated or modified so as to limit the power of the Commissioner to demand statistics of cases, in such manner as would be within the law and not be a burden upon the doctors

"It may very well be that the present Commissioner has only the best of motives in desiring such a clause in this bill and would not abuse it, whereas another Commissioner might make all kinds of trouble. On the other hand, there can be no doubt of his right to prevent, as far as possible, wanton waste of costly laboratory prod-

# BRIEFS ON BILLS

## OPPOSITION TO COUNTY PUBLIC HEALTH NURSES' BILL

SENATE INTRODUCTORY 283, CONC ASSEMBLY INTRODUCTORY 399

The Medical Society of the State of New York, composed of over ten thousand physicians and representing in a majority degree the sentiment of all of the Medical Societies of the various Counties, begs leave to enter its objection to the above bills for the following reasons, and would request that these bills be kept in committee and not reported to the legislative bodies for consideration

*First* Under these bills direction of the public health nurse would be given over "To a committee of members of the board of supervisors, to be known as the committee on public health" No mention is made as to whether any member shall be a physician Since the public health nurse's work primarily has to do with the sick and the prevention of disease, it is the Society's opinion that her direction should be left to a committee of physicians and not to a committee of lay persons Such committee should be nominated by the physicians of the County Medical Society, who will act as the balancing power in such movements, for to them these lay boards must turn, and do turn, for medical advice—in many instances given gratis and sought gratuitously "because the doctor is the best posted on this matter"

This committee of physicians to serve efficiently should be freed from the entanglements of state governmental function and should represent solely its professional brethren

The desire on the part of half educated persons to initiate partial or complete medical treatment upon their own judgment and without proper supervision is becoming more and more apparent and instead of the physician being sought for his advice, we find that in many movements in behalf of the public health, the paid secretary of a welfare organization is the one first sought out

*Second* Among her duties are mentioned pre-natal care and maternity protection It is in-

ferred that the law intended she should give instructions in pre-natal care and maternity protection If such is the intention, it should be so stated "Discover and visitation of cases of tuberculosis, prevention and control of communicable disease, the care of the sick who may otherwise be unable to secure adequate care," are all duties for a physician and not for a nurse She may assist the physician, but can only work under his direct supervision in carrying out his immediate instructions

If this bill were enacted into law, the nurse employed by a board of supervisors to do public health nursing, might interpret her function to include diagnosis of disease from complaints and symptoms observed on her visits, without consulting a physician She might assume to take full charge of a maternity case through the pre-natal period, calling a physician only for the delivery It would leave her to decide whether adequate care other than that she herself supplied, could be gotten, and in many instances might attempt to limit her efforts to find medical care, or if she found working with a certain physician unpleasant, or if she developed a lack of confidence in a physician, she might choose not to co-operate with him, considering his efforts as inadequate

On the whole, this bill is placing entirely too much responsibility upon the nurse, considering the serious character of her work, which frequently involves life and death, a condition which the state recognizes as only to be undertaken by regularly licensed physicians

It is stated in the last paragraph that an advisory committee may be appointed, of which one member shall be a physician, but advisory committees are not directing committees and are only called to function when the directing committee feels itself lost, thus, although a physician may be appointed to this committee, he may have but a slight opportunity to assist in the direction of the nurse

make my friends use antitoxins as they should (I am the custodian of a station)"

For the bill we have the following

From a member of the Advisory Committee on Legislation

"I think the bill is a good one for the following reasons

1 "It will increase efficiency of the State Laboratory,

2 "It will prevent the present waste of much laboratory material,

3 "It is not too much to ask of the physician in return for the great service of free laboratory work,

4 "Any case that does not want a report sent to Albany should pay for the service,

5 "The physician should collect from his patient"

FROM COUNTY CHAIRMEN

1 "I am in accord with the accompanying bill The physician should report While he is not allowed to charge for the laboratory products,

he should charge for the extra time given to such reports and for administration, and then report"

2 "I am in general in favor of the bill I never have believed in the ultimate benefits of the free laboratory supplies furnished by the State Department of Health

3 "I see no objection. I think that the State Department is within its rights The doctor can escape a payment of a fee by submitting the required data I believe that there is value in the conclusions that can be drawn from these reports I hope that the bill will pass"

4 "I have no objection to make As you no doubt know, for years in every package sent out by the State Department of Health, a small slip requested data as to the results obtained Probably most of these have never been returned, and in order to keep records as to good or bad effects, the Department endeavors to try a new method If the physician wishes free products, he should report as to results, and if he does not care to report results, he can purchase the products"

---

## PROHIBITION ENFORCEMENT

Senate Int No 29, Assembly Int No 527

*Comment* Several protests have at last been received from physicians mainly along the lines that this law would duplicate the federal law and suggest that there would be more names added to the State payroll

One letter especially contains the criticism that "We have too many laws and too large a tax levy

"It is unnecessary to say to you that this country is mortally ill from a plague of laws, and any doctor who has to do with the Volstead Act doesn't want to be further handicapped by Anti-Saloon League legislation"

It would seem that physicians, as members of the Medical Society of the State of New York, should be interested in such a bill only to know that their rights as physicians in prescribing intoxicating liquors for medicinal purposes are

not curtailed The physician maintains that within professional limits and judgment, he should be allowed to prescribe anything which seems best for his case, and in that he is already governed or surrounded with laws when he transgresses this right In fact, sometimes he is prosecuted for malpractice when it is for the jury to decide as to whether he has used the best judgment as exhibited in his community

Secondly, as a State body, the Medical Society is interested to the degree of limitation "in paper work" insofar as it is practicable, since the multiplicity of rules and regulations governing the practice of medicine is now so great as to consume much of the physician's time in doing clerical work, thus depriving the public of that time in professional services

ucts and to adopt proper measures for obtaining scientific statistics for his department. But it is difficult to see how it is proper for him to exercise his rights, either as an economist or statistician, at the expense of the private rights of doctors and patients. The enactment of such a law would establish a bad precedent.

"The difficulty for me in answering your question lies in the fact that such laboratory supply stations as are called for in this bill are very much needed throughout certain districts in the State. On the other hand, the Medical Society of the State of New York should consider it a duty to support the Commissioner of Health in every legitimate effort to increase the usefulness of his department for the people of the State. The matter is very important for both him and us, in this particular, as he is in duty bound to give to the State efficient service, and it is up to us to support him in every such legitimate effort.

"As above stated, I feel that, without the italics, we could stand for this bill, but with them it would be improper to do so."

*Committee on Economics* is opposed on the following grounds:

1 The reports of the character called for are contrary to the best traditions of medicine.

2 They would deter patients from seeking medical advice.

3 Empowering the Health Commissioner to make a charge is tantamount to vesting him with the power to penalize the profession.

#### COMMITTEE ON LEGISLATION

"More paper work for the doctor, more State influence with private patients, discourages doctor from using laboratory help, too drastic."

Advisory Committee on Legislation objects:

1 That the burden imposed upon the custodian of the laboratory supplies is so great that physicians would refuse either to collect the funds or to serve as custodian.

2 The fact that reports are not received by the laboratory does not lessen the value of the materials supplied to emergency and indigent cases. Physicians may recall when antitoxin was first distributed, charge was made for syringe. In many instances the physicians chose to pay these fees from their own pocket rather than suffer the annoyance of collecting them from the patients. It is an unnecessary and unwarranted amendment.

#### FROM THE COUNTY LEGISLATIVE CHAIRMEN

1 "I have carefully read it over and taken it in from all sides. I am very much opposed to the bill as presented. It is not the price as much as the time it takes to keep the records."

2 "We are decidedly opposed to this bill."

3 "The amendment is objectionable to the medical profession and unnecessary from the standpoint of public health. Such reports as may be called for and demanded from practicing physicians, under this act, may be so voluminous and laborious to compile, that they may very likely force the doctors using State materials to procure their supplies from commercial sources, which would not be as dependable as our own State laboratory. Under the present law, no doctor using State products would refuse to submit reasonable clinical data. All the physicians, however, who have seen the proposed law, agree with me and are emphatically opposed to it."

4 "It is unnecessary, unwise, arbitrary, and tends to increase centralization of power in the State Department of Health."

5 "I am opposed absolutely to Assembly Bill Introductory No. 1167."

6 "I supposed the laboratories of the State Department of Health were to assist the physicians located outside the practical zone of the City laboratory, to get for their patients some of the advantages of the city residents. By adding more work to the already overworked physician, and penalizing him for failure, will defeat the purpose of the laboratory. I can see no reason for this legislation."

7 "I wish to state that this Society is opposed to its provision."

8 "Would say that I am not in favor of the amended provision relating to reports, fees, etc. Believe that it would not work out well, in a practical way, with the doctors or the public."

9 "Assembly Bill Print No. 1239, Introductory No. 1167, was presented, and it was the opinion of the members present that they were opposed to said bill on the grounds that it would add another burden to those already carried by the general practitioner. In case of an epidemic in a community with few physicians, the making out of compulsory reports, the extent of which we do not know, would be too much, and also the penalty of compelling the physician to pay for his laboratory supplies, when said regulations were not complied with, would not always work to the advantage of the patient. This County Medical Society is opposed to said legislation."

10 "I am against this bill. *First*, it will prevent the free use of antitoxins. If one has to write a clinical paper for every dose one gives, I should want to buy my own. The requirement of report is fair, *second*, the Department would have to establish its own stations and the cost (at present \$2000) would prevent their number being sufficient for quick service, *third*, it would punish the suffering poor for the faults of the practitioner. We country doctors have no office nurse to keep our records. I find it hard now to

### County Public Health Nurses

Senate Int No 283 (conc Assembly Int 399)

*Comment* Your Committee on Legislation has been unable to have any changes brought about by proposed amendments in the status of this bill, whereby the medical man shall be reasonably recognized and not ignored except by the remote possibility of the advisory committee which the board of supervisors is empowered to appoint

At the time of this comment the bill is now on the floor of the Senate for passage and it is hoped that the Assemblymen will see the propriety of the requests of the members of the Medical Society in so amending the bill as to make it satisfactory to the country physicians who are the ones most naturally interested in this type of proposed legislation

Your Committee on Legislation is still opposed to the bill in its present form and trusts that the County Legislative Chairmen have impressed upon their legislators the reasons for the desired amendments

### Health Service in Schools

Senate Int No 302 (conc Assembly Int 748)

*Comment* This bill is still in Public Education Committees of both houses, but the question as to what is meant by the term "health experts" has not as yet been answered to the satisfaction of your Committee on Legislation, yet no comments have been received from the members of the Society in frank opposition to the bill

### Injured Employee to Select His Physician

Senate Int No 380 (conc Assembly Int 570)

*Comment* No further comment except that the bill seems to hang fire in both committees, and a letter from one of the legislators would seem to indicate that the bill may die in committee unless the County Legislative Chairmen bring pressure to bear by argument upon the committees on Labor and Industry of both houses to push it onto the floor of the Senate and the House

### Inspection of School Children

Senate Int No 586 (conc Assembly Int 580)

*Comment* This bill still lies in the Public Education Committees of both houses

No comment at present

### Free Choice of Physician

Senate Int No 594 (conc Assembly Int 301)

*Comment* Still in Labor and Industry Committees of both houses See previous comments

The Society even through its individual members and its committees seems unable to have this bill advanced except as the individual physician may make a demand upon his own legislator to

see why the bill is not brought out of the committees

Many members of the Medical Society of the State of New York belong as well to a group of physicians active and organized who might be supposed to oppose such a measure as the free choice of physician, so that it will take extra weight on the part of your Society to extricate this bill from the committee if with any success

### Practical Tests of Injured Persons

Senate Int No 647 (conc Assembly Int 184)

*Comment* Still in Labor and Industry Committees of both houses

Your Committee on Legislation has been honored with a letter from Senator Johnson in which he has commented on a change by striking out the first "such" in the italicized reading, which would then read, "and may make physical examinations and practical tests of claimants and so forth" This, to a degree, modifies the bill and removes some of the objection, for which your Society is grateful, but the fact still remains that the commissioner will be given the power under this new amendment to make physical examinations and practical tests of claimants himself, and then sit in judgment as to his lay physical examinations in comparison with that of a physician which from the standpoint of law is an absurdity where one sits as attorney for the defendant as well as judge and jury, or *vice versa*

The principle of the bill is wrong, for now even the commissioner or deputy "may make such investigation or inquiry or conduct such hearing in such manner as to ascertain the substantial rights of the parties"

This places the commissioner in the seat of referee and should he desire advice on the matter, at present he is at liberty to utilize by subpoena the services of anyone in connection with the case, *but he is not allowed to pose as the whole court room and its occupants* under the present law

The County Legislative Chairmen should continue their opposition to this bill as it stands at present, since as to the question of medical advice your State Society feels that only those who have been properly schooled are the ones to pass upon the same There could be no objection to such a bill if by chance the commissioner was a licensed physician or even had taken a preliminary medical course to familiarize himself with injured persons and the lesions pertaining thereto

### Physically Handicapped Persons

Senate Int No 671 (conc Assembly Int 868)

*Comment* Still in Judiciary Committees of both houses

Hearing to be held on March 4th

## SUMMARY OF BILLS INTRODUCED IN LEGISLATURE IN SENATE

### Commission on Crippled Children

Senate Int 114 (conc Assembly Int 226)—  
Bill passed both houses Now in the hands of  
the Governor

### The Narcotic Bill

Senate Int No 115 (conc Assembly Int 215)

*Comment* There is no further comment to  
offer in relation to this bill

Criticism has been directed against the bill  
mainly from those who would deal in the drugs  
mentioned, but it is to be hoped that their breadth  
of vision will be such as to accept such a bill  
which attempts to limit one of the greatest  
present evils of this country, as physicians  
realize

It is to be recognized that this bill has been  
drawn after the conference of last year, called by  
Governor Smith, and that it has in it none of  
the objections which have been voiced by the  
majority of physicians in the years past

### Requiring the Licensing of Private Institutions for the Treatment of Drug Addicts

Senate Int No 116 (conc Assembly Int 216)

*Comment* This bill is still in the Committees  
and it seems that decided objection has been  
raised to its being put on the floor

The same comment as in previous issues ap-  
plies in that it would seem to be very proper  
that the Society work for the passage of the bill

### The State Department of Education Bill Amending the Medical Practice Act

Senate Int No 211 (conc Assembly Int 307)

*Comment* Attention of the members of the  
Medical Society should be directed to the fact  
that we now have two bills which in verbiage are  
very similar to this Karle-Dunmore bill

In the Assembly Mr Esmond's bill, Int No  
649, is almost identical with the Karle-Dunmore  
bill, simply omitting from the latter such sections  
obnoxious to the chiropractors and introducing  
such clauses as will give them the legal right to  
practice.

In the Senate Mr Fearon's bill, Int No 944,  
is similar to the Karle-Dunmore bill, but in gen-  
eral leaves the examination of future practition-  
ers to the present state board of medical exam-  
iners without the addition of a chiropractic  
representative, places the chiropractors in a posi-  
tion as of practicing osteopathy, *but contains a  
waiver clause of admittance for those who have  
practiced eight years*

Your Committee on Legislation now has defi-  
nite communications from the Kings County  
Medical Society in opposition to the Karle-Dun-

more bill, the arguments against it appearing in  
another part of the JOURNAL

The Queens County Medical Society has also  
transmitted its opposition to the Karle-Dunmore  
bill in a letter stating that on February 24th, the  
Society voted to oppose the bill

The hearing on this bill is called for Wednes-  
day, March 4th, and a resume of the results of  
the hearing will be published in the next  
JOURNAL

### Inspection by State Charities Boards of Children's Institutes

Senate Int No 228

*Comment* This bill will be kept before the So-  
ciety with no further comment as yet

### Qualifications of Examiners in Lunacy

Senate Int No 263—A bill introduced in the  
Senate by Senator James A Higgins of Kings  
County, would amend section 81, Insanity Law,  
relative to qualifications of examiners in lunacy  
Referred to General Laws Committee

*Comment* Physicians have awakened to the  
fact that this bill would so limit the examinations  
in lunacy as to almost negate its practicability

One communication states that "it is difficult  
enough now in emergencies to secure a second  
physician for such examination, especially in the  
smaller places You can readily see that in rural  
sections, it would require two physicians from a  
neighboring city to make such examination Fur-  
thermore, a general practitioner, as a rule, is  
quite competent to determine whether a person  
is insane within the scope of the law, while under  
the present conditions, if a patient has been ad-  
mitted to a state hospital improperly, the exam-  
ination by the physicians in the institution would  
determine any case in question

Further-  
more, I believe, a physician who has had a post-  
graduate course in nervous and mental diseases  
but who has not necessarily had two years actual  
experience in an institution for the insane, quite  
as competent to pass on mental disturbances"

The New York State Sanitary Officers' Asso-  
ciation has transmitted through its secretary, to  
the Legislative Bureau, a communication in op-  
position to the measure, pointing out that health  
officers at the present time have powers of com-  
mitment, but should this bill pass, the number  
of those who have had actually two years' ex-  
perience in a hospital for the mentally sick, would  
virtually reduce their number to none, and he  
would be seriously hampered in seeking qualified  
men under the provisions of the new law in  
emergencies that arise with which he now is  
legally entitled to deal

again is in behalf of a special society and not of the body politic as a whole

Those who have read the bill realize that the State Board of Regents are bound hand and foot, subservient to the New York State Chiropractic Society and that in general all chiropractic magazines are dwelling upon the financial and commercial aspects in the benefits to be derived from the practice of this cult to say nothing of the loopholes in the bill whereby the regents have really no authority as they have under the present medical practice act

Should the thought of this bill prevail it would not be wrong for the Medical Society of the State of New York to seek appointments for its chosen political members to sit on the board of state medical examiners, nor for the homeopathic or eclectic societies to do the same as well as for the osteopathic society. Such a power would throw the state licensure again into chaos as existed in years gone by, but happily in the advancement of education has been overcome

The bill is bad throughout, and while it contains many clauses which have been copied from previous laws and from the Karle-Dunmore bill as well, it should be vigorously opposed by all those who honestly believe in the true conservation of public health through rightful types of legislation and not in behalf of a class or group

#### Laboratory Supplies

Senate Int No 943 (conc Assembly Int 1167)  
—Bill printed in full in February 27th JOURNAL under Assembly Int. 1167, page 343

*Comment* Much opposition has developed to this bill, some coming from the health officers themselves, as well as many letters from practitioners who realize that the passage of such a bill will seriously influence the reports in an opposite manner from that which is intended by the bill. Some of the objections are as follows

(1) "Many physicians will not avail themselves as formerly of the proposal of the Health Department to furnish free laboratory supplies for indigent patients unless the physician discloses what may be demanded by the Health Department on its slips"

(2) One physician writes "It would be hard to say to what length in foolish blanks the physician would be called upon to waste his valuable time by filling in, and the taxpayer would have a little more added to his already heavy load"

(3) The physician above also writes "that it is good public health policy to distribute laboratory products freely through health officers as at present and ask no questions"

(4) Another says "That type of legislation, it seems to me, is particularly offensive which enables the state department of health or any

other department, to hold a gun at a doctor's head"

(5) It is a question whether it is good policy for the state department of health or any other state department to enter into business competition with the inhabitants of the state. In this instance the state department of health might have small charges against many physicians for oversight in filling in one or two answers and to collect the fifty cents or so which might be due for the products or "market prices and fees therefore," might expend much more than would be returned, and thus plunge the state into a far greater debt than was originally intended by public health appropriations

The theory of the state appropriation to the state department of health is that all of the people of the state contribute their moneys for the purpose of being protected in their health from the careless few ignorant and otherwise who irk under government control. Far cheaper is it to expend a thousand dollars by distributing small-pox vaccine only to be used in a limited community perhaps, but where most needed than to have only part of that thousand dollars for such distribution and the balance to be expended in collecting debts from physicians who in emergency may have stopped other pestilence from spreading

(6) "If the intent of this bill is to enforce the filling out of the existing blanks or any modifications thereof that are reasonable, then I believe that we should support it, but it does not say so in the text. The proposed amendment to the law would give to the commissioner the right to read into the law anything that he saw fit, *even to the extent of making it so burdensome that the use of the state supplies would of necessity have to be discontinued*—ED. There can be no doubt that the expense of providing supplies as is now done involves an immense expenditure of money, on which there is no financial return. This may need to be corrected, but it should not be handled in the manner in which the text of the proposed amendment would indicate that it could be.

"Furthermore, this proposed amendment by leaving so much unsaid, would permit of many abuses, besides a lot of unjust discriminations and no end of trouble. There is too much centralization of power and it smacks of state *medumne*

"We do not want the collection of personal data and other objectionable features similar to what was in existence when we were cursed with the state narcotic department

"My reaction to this bill is that the state department of health cannot afford and should not put any difficulties in the way of practicing physicians using their therapeutic supplies, right-

No further comment is offered than is noted on page 331 of your February 27th JOURNAL, but attention is again called to the fact that the old law should be amended requiring the court when appointing or designating a physician or psychologist to designate a physician duly licensed to practice in this state

#### **The Drugless Practitioner Bill**

Senate Int No 473, by Mr Gibbs

*Comment* While the Gibbs bill seems to be in behalf of public health by permitting any and all who wish so to do to practice the healing art, *because those who have practiced must have obtained some knowledge through this practice*, it is nevertheless to be condemned most severely for its low grade and should be fought most vigorously

The argument should not prevail of a *waiver clause in any amendment to the present law regarding the practice of the healing art*. Similarly no one should be allowed to practice until he has shown the worth of his basic education to be satisfactory, to the Department of Education of this state

This pan cult bill might better have been drawn to do away with examinations of any sort, with the destruction of the higher educational system of this state, with the overthrowing of our magnificent State Department of Health, and in the place of all these allow to be established without government or reasonable co-operation the savagery and witchcraft of treatment of the middle ages

During the last week, Senator Gibbs has introduced amendments to the bill. It originally provided under treatment for "the removal of abnormalities", in the amendment the words "the removal of" are stricken out

The educational requirements of those seeking examination for license are enhanced by requiring a minimum of a high school course or its equivalent

Section 285-h has been amended by the addition of a new paragraph, which provides for licensing practitioners to practice additional drugless methods after they have been licensed for one method. The paragraph follows

"That method or methods which he or she stated in the application for license. Any licensed drugless practitioner may be certified by the board to practice additional drugless methods after satisfactory proof has been offered as to ability and qualifications. The regents may waive the examination of any applicant for license hereunder who presents satisfactory proof that he has been duly licensed as a practitioner in any other state of the United States, upon such waiver and the payment of the fee of twenty-five

dollars the regents shall issue to him a license as provided in this section"

Section 285-1 has been amended by adding a new paragraph so as to provide for this person who have been practicing their method less than two years at the time the bill goes into effect.

The new material follows

"All drugless practitioners having a diploma from a legally incorporated school or college of drugless methods, who have practiced within this state when this law goes into effect, less than two years, shall pass an oral examination before the board in the theory and practice as taught in the school or college from which he or she graduated. The state board of regents shall issue a license to practice drugless methods to all those certified by the board"

#### **Admission of Foreign Practitioners**

Senate Int No 693 (conc Assembly Int 950)

*Comment* Still in Public Health Committees in both houses

No further comment

#### **Revocation of License to Practice Medicine**

Senate Int No 701—Still in Senate Public Health Committee

*Comment* Your Committee believes this bill is a fair bill and that it should pass and trusts that those who are interested in its passage will work for the same, inasmuch as the members of the Medical Society of the State of New York should stand ever ready to penalize such of its members as require it and looks upon the judiciary of the state and nation as one body from which naught but fairness and sound thinking will emanate

#### **Rural Hygiene**

Senate Int No 716 (conc Assembly Int 969)—A bill introduced in the Senate by Senator Leigh C Kirkland of Randolph, N Y, concurrent Assembly Int 969, by Assemblyman Frank H Lattin of Orleans County, would add new article to 2-b, Public Health Law, establishing provision of rural hygiene in State Department of Health and appropriating \$10,000

Referred to Finance Committee of Senate and to Ways and Means Committee of Assembly

#### **The Bouton Chiropractic Bill**

Senate Int No 789—A bill introduced in the Senate by Senator Arthur F Bouton of Roxbury, would define and regulate the practice of chiropractic

Referred to Public Health Committee

*Comment* This is another of the cult bills which the Society is called upon to fight and

cretion on the approval of the board of regents indorse a license or diploma of a physician from another state, provided the applicant has met all the preliminary and professional qualifications required for earning a license on examination in this state, has been in reputable practice for a period of ten years, and has reached a position of conceded eminence and authority in his profession. Any physician, who was actually engaged in the practice of medicine in this state prior to September first, eighteen hundred and ninety-one, and who failed to register, although eligible to do so at the time, or any physician, whose registration is not legal because of some error, misunderstanding or unintentional omission, may on the unanimous recommendation of the state board of medical examiners that he has submitted satisfactory proof of having complied with all the requirements prescribed by law at the time of his failure to register, or his incomplete registration, receive from the regents under seal a certificate of the facts which may be registered *in accordance with this act* [by any county clerk and shall make valid his registration] Before any license is issued it shall be numbered and recorded in a book kept in the regents' office, and its number shall be noted in the license, and a photograph of the licensee filed with the records. This record shall be open to public inspection, and in all legal proceedings shall have the same weight as evidence that is given to a record of conveyance of land.

§ 5 Section one hundred and seventy of such chapter is hereby amended to read as follows:

§ 170 *Registration* [Registry, revocation of license, annulment of registry. Every license to practice medicine shall, before the licensee begins practice thereunder, be registered in a book kept in the clerk's office of the county where such practice is to be carried on, with name, residence, place and date of birth, and source, number and date of his license to practice. Before registering, each licensee shall file, to be kept in a bound volume in a county clerk's office, an affidavit of the above facts, and also that he is the person named in such license, and had, before receiving the same, complied, with all requirements as to attendance, terms and amount of study and examinations required by law and the rules of the university as preliminary to the conferment thereof, that no money was paid for such license, except the regular fees paid by all applicants therefore, that no fraud, misrepresentation or mistake in any material regard was employed by any one or occurred in order that such license should be conferred. Every license, or if lost a copy thereof legally certified so as to be admissible as evidence, or a duly attested transcript of the record of its conferment, shall before registering, be exhibited to the county clerk, who, only in case it was issued or indorsed as a license un-

der seal by the regents, shall indorse or stamp on it the date and his name preceded by the words "registered as authority to practice medicine in the clerk's office of . . . county." The clerk shall thereupon give to every physician so registered a transcript of the entries in the register with a certificate, under seal that he has filed the prescribed affidavit. The licensee shall pay to the county clerk a total fee of one dollar for registration, affidavit and certificate. The regents shall have power at any and all times to inquire into the identity of any person claiming to be a licensed or registered physician and after due service of notice in writing, require him to make reasonable proof, satisfactory to them, that he is the person licensed to practice medicine under the license by virtue of which he claims the privilege of this article. When the regents find that a person claiming to be a physician, licensed under this article, is not in fact the person to whom the license was issued, they shall reduce their findings to writing and file them in the office of the clerk of the county in which said person resides or practices medicine. Said certificate shall be *prima facie* evidence that the person mentioned therein is falsely impersonating a practitioner or a former practitioner of a like or different name. The regents may revoke the license of a practitioner of medicine, or annul his registration, or do both, in any of the following cases:

(a) A practitioner of medicine who is guilty of any fraud or deceit in his practice, or who is guilty of a crime or misdemeanor, or who is guilty of any fraud or deceit by which he was admitted to practice, or

(b) Is an habitual drunkard or habitually addicted to the use of morphine, opium, cocaine, or other drugs having a similar effect, or,

(c) Who undertakes or engages in any manner or by any ways or means whatsoever, to procure or perform any criminal abortion as the same is defined by section eighty of the penal law, or,

(d) Who offers or undertakes by any manner or means to violate any of the provisions of section eleven hundred and forty-two of the penal law.

Proceedings for revocation of a license or the annulment of registration shall be begun by filing a written charge or charges against the accused. These charges may be preferred by any person or corporation, or the regents may on their own motion direct the executive officer of the board of regents to prefer said charges. Said charges shall be filed with the executive officer of the board of regents, and a copy thereof filed with the secretary of the board of medical examiners. The board of medical examiners, when charges are preferred, shall designate three of their number as a committee to hear and determine said

fully and properly There should be encouragement in the use of such supplies and the penalties for illegal use should be found elsewhere "

Several health officers have written that if they are obliged to keep more books in relation to state department of health supplies and their distribution, to record the changing market values, and to act as collection agencies and to dun their fellow practitioners, they feel the state goes too far in such a measure

### A Chiropractic Bill

No 995

Int 944

IN SENATE,

February 24, 1925

Introduced by Mr Fearon—read twice and ordered printed, and when printed to be committed to the Committee on Public Health.

### AN ACT\*

To amend the public health law, in relation to the practice of medicine.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Section one hundred and sixty-four of chapter forty-nine of the laws of nineteen hundred and nine, entitled, "An act in relation to the public health, constituting chapter forty-five of the consolidated laws," is hereby amended to read as follows

§ 164 *Expenses* The fees derived from the operation of this article, *except as otherwise provided in section one hundred and seventy-three, subdivision five*, shall be paid into the state treasury, and the legislature shall annually appropriate therefrom for the Education Department an amount sufficient to pay all proper expenses incurred pursuant to this article

§ 2 Section one hundred and sixty-six of Chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health constituting chapter forty-five of the consolidated laws" is hereby amended by adding thereto a new subdivision seven, to read as follows

7 Where the application be for a license to practice chiropractic, the applicant shall produce evidence that he has studied chiropractic not less than four years including four satisfactory courses of not less than seven months each in four different calendar years in a school or college maintaining a standard satisfactory to the regents

§ 3 Section one hundred and sixty-seven of such chapter, as amended by chapter 496, of the laws of 1923, is hereby amended to read as follows

§ 167 *Questions* The board shall submit to

the regents, as required, lists of suitable questions for thorough examination in anatomy, physiology, hygiene, chemistry, surgery, obstetrics, gynecology, pathology including bacteriology, and diagnosis From these lists the regents shall prepare question papers for all these subjects, which at any examination shall be the same for all candidates, except that the examination may be divided as provided in section one hundred and sixty-six *Provided, however, that prior to July first, nineteen hundred and twenty-five, where the examination be for an applicant to practice Chiropractic, the foregoing question papers shall be confined to the subjects of Anatomy, Physiology, Hygiene, Diagnosis and Chemistry, and thereafter the examination shall be the same as that prescribed for practitioners of osteopathy*

§ 4 Section one hundred and sixty-nine is hereby amended to read as follows

§ 169 *Licenses* On receiving from the state board an official report that an applicant has successfully passed the examinations and is recommended for license, the regents shall issue to him a license to practice according to the qualifications of the applicant Every license shall be issued by the university under seal and shall be signed by the president and secretary of the board and by the officer of the university who approved the credential which admitted the candidate to examination, and shall state that the licensee has given satisfactory evidence of fitness as to age, character, preliminary and medical education and all other matters required by law, and that after full examination he has been found properly qualified to practice Applicants examined and licensed in accordance with the provisions of this act, who, when admitted to the licensing examination, were citizens of a foreign country, and who had declared intention of becoming citizens of the United States, shall, upon passing the examination, be issued a license valid for six years from the date of such declaration of intention and upon failure of such licensee to furnish evidence of his having actually become a citizen his license shall become invalid and automatically become revoked and his registration shall be annulled Applicants examined and licensed by other state examining boards registered by the regents as maintaining standards not lower than those provided by this article and applicants who matriculated in a New York State medical school before June fifth, eighteen hundred and ninety, and who received the degree of doctor of medicine from a registered medical school before August first, eighteen hundred and ninety-five, may without further examination, on payment of twenty-five dollars to the regents and on submitting such evidence as they may require, receive from them an indorsement of their licenses or diplomas conferring all rights and privileges of a regents' license issued after examination The commissioner of education may in his dis-

\* Matter in *italics* is new, matter in brackets [ ] is old law to be omitted.

county medical society existing in the county of his residence or to the secretary of any incorporated state medical society in which said county medical society is represented, the name and address of any person known to be practicing medicine whose name does not appear in this registry. The names of persons giving such information will not be divulged."

The names of physicians which shall in any year be added to said list after the same shall have been so printed and distributed as aforesaid, shall be reported quarterly to the secretary of any duly incorporated state medical society of which county medical societies are components.

5 Any licensed physician who having failed or neglected to register by January first of any year as required by the provisions of this section shall be required to pay upon registration, in addition to the fee of two dollars, a further fee of one dollar for each thirty days or part thereof, that he is in default, and any licensed physician who engages in practice and wilfully refuses or omits to register hereunder, shall be subject to a civil penalty of one dollar for each day that such wilful refusal or omission shall continue, provided that if the same continues for more than thirty days the penalty thereafter shall be five dollars per day so long as the said wilful refusal or omission shall continue, said penalty shall be recoverable in an action by the attorney-general of the state maintained in the name of the people of the state of New York.

6 The penalties provided in this section for failure, neglect or omission of a duly licensed physician to register under this article shall be the only penalties that may be imposed therefor, and the legality of his license shall not be affected thereby, and such penalties may for good cause shown, in the discretion of the regents, upon the recommendation of the board of medical examiners, be remitted or compromised.

7 Each licensed physician shall conspicuously display his proper registration certificate in his office at all times.

§6 Section one hundred and seventy-one of such chapter amended by chapter fifty-three of the laws of nineteen hundred and fifteen, is hereby repealed.

§7 Section one hundred and seventy-two of such chapter is hereby renumbered section one hundred and seventy-one.

§8 Section one hundred and seventy-three of such chapter as amended by chapter two hundred and eighty-two of the laws of nineteen hundred and twenty-four is hereby renumbered section one hundred and seventy-two and amended to read as follows:

[173] 172 Construction of this article [This article shall not be construed to affect commissioned medical officers serving in the United States army, navy or marine hospital service, while so commissioned, or any one while actu-

ally serving on the resident medical staff of any legally incorporated hospital, or any one while actually serving as an interne in a state hospital or other state institution in which medical service is provided, or any legally registered dentist exclusively engaged in practicing dentistry, or any person or manufacturer who mechanically fits or sells lenses, artificial eyes, limbs, or other apparatus or appliances, or is engaged in the mechanical examination of eyes, for the purpose of constructing or adjusting spectacles, eyeglasses and lenses, or any lawfully qualified physician in other states or countries meeting legally registered physicians in this state in consultation, or any physician residing on a border of a neighboring state and duly licensed under the laws thereof to practice medicine therein, whose practice extends into this state, and who does not open an office or appoint a place to meet patients or receive calls within this state, or any physician duly registered in one county called to attend isolated cases in another county, but not residing or habitually practicing therein, or the furnishing of medical assistance in case of emergency, or the domestic administration of family remedies, or the practice of chiropody, or the practice of the religious tenets of any church. This article shall be construed to repeal all acts or parts of acts authorizing conferment of any degree in medicine *causa honoris* or *ad eundem* or otherwise than on students duly graduated after satisfactory completion of a preliminary medical course not less than that required by this article as a condition of license.]

I This article shall not be construed so as to prevent the following: (1) The practice of medicine in this state in obedience with the requirements of the laws of the United States, of any commissioned medical officer serving in the United States army, navy, or public health service while engaged in the performance of the actual duties prescribed for him under the United States statutes; or (2) the practice of medicine in a duly incorporated hospital operating pursuant to the state charities law, of a duly appointed member of the resident medical staff or of an interne, or (3) the practice of medicine by any physician duly licensed to practice medicine in a bordering state, who resides on a border of such neighboring state, whose practice extends into this state and who does not open an office or appoint a place to meet patients or receive calls within this state, or (4) any lawfully qualified physician in other states or countries meeting legally registered physicians in this state in consultation, or (5) the furnishing of medical assistance in case of emergency, or (6) the domestic administration of family remedies, or (7) the practice of chiropody, dentistry, or veterinary medicine, provided those practicing are legally authorized and licensed under the laws of this state so to do, or (8) the practice of the religious tenets of any

charges. A time and place for the hearing of said charges shall be fixed by said committee as soon as convenient, and a copy of the charges, together with a notice of the time and place when they will be heard and determined, shall be served upon the accused or his counsel, at least ten days before the date actually fixed for said hearing. Where personal service or service upon counsel can not be effected, and such fact is certified on oath by any person duly authorized to make legal service, the regents shall cause to be published for at least seven times, for at least twenty days prior to the hearing, in two daily papers in the county in which the physician was last known to practice, a notice to the effect that at a definite time and place a hearing will be had for the purpose of hearing charges against the physician upon an application to revoke his license. At said hearing the accused shall have the right to cross-examine the witnesses against him and to produce witnesses in his defense, and to appear personally or by counsel. The said committee shall make a written report of its findings and recommendations, to be signed by all its members, and the same shall be forthwith transmitted to the executive officer of the board of regents. If the said committee shall unanimously find that said charges, or any of them are sustained, and shall unanimously recommend that the license of the accused be revoked or his registration be annulled, the regents may thereupon in their discretion, revoke said license or annul said registration, or do both. If the regents shall annul such registration, they shall forthwith transmit to the clerk of the county or counties in which said accused is registered as a physician, a certificate under their seal certifying that such registration has been annulled, and said clerk shall, upon receipt of said certificate, file the name and forthwith mark said registration "annulled." Any person who shall practice medicine after his registration has been marked "annulled" shall be deemed to have practiced medicine without registration. Where the license of any person has been revoked, or his registration has been annulled as herein provided, the regents may, after the expiration of one year, entertain an application for a new license in a like manner as original applications for licenses are entertained, and upon such new application they may in their discretion, exempt the applicant from the necessity of undergoing any examination.]

1 Every person now lawfully engaged in the practice of medicine within the state and every person hereafter duly authorized to practice medicine, shall, on or before January first of each year, apply to the secretary of the board of medical examiners for a certificate of registration with the regents of the university upon a blank form which shall be furnished by said secretary and shall pay at such time to said secretary a fee of two dollars, provided that any physician who has

registered for five consecutive years hereunder shall register annually without the payment of fee and be so registered during the time he shall thereafter continuously practice medicine in this state

2 A physician in making his first registration hereunder shall write or cause to be written upon the application blank so furnished by said secretary, his full name, post-office and residence address, the date and number of his license and such other facts for the identification of the applicant as a licensed practitioner of medicine as the regents may deem necessary and shall duly execute and verify the same before an officer empowered to take acknowledgments of deeds and deliver the same to said secretary by mail or in person. Subsequent registrations after the first registration need not be upon a sworn application by the applicant unless in a particular case the regents, for reasons satisfactory to them, may require that the application be under oath, such subsequent registration shall be made with as little inconvenience to duly licensed practitioners of medicine as possible and to that end the secretary of the board may employ and use in obtaining such subsequent registrations, the assistance of the secretary of duly incorporated medical societies who shall be empowered as a representative of the secretary of the board to receive and transmit such application blanks from physicians after the physicians' first registration, together with the license fees payable upon such applications

3 The secretary of the board, on or before October first of each year, after the first registration, shall mail or cause to be mailed to every physician registered in his office, a blank form of application for registration addressed to the last known post-office address of such physician or may cause such blank form of application to be sent to such physicians through the secretary of any duly incorporated medical society. The form of application shall be such as to contain proper spaces for the insertion by the applicant of the information required under paragraph 2 of this section

4 The secretary of the board shall issue to any duly licensed physician in this state, upon his application therefor in accordance with the provisions hereof, a certificate of registration under the seal of the university for the year ensuing and ending December thirty-first

Upon the first of March in each year, or within ten days thereafter, the secretary of the board shall publish and cause to be mailed to each physician registered hereunder in this state, a printed list of the duly registered physicians in this state and each such published list shall contain at the beginning thereof these words

"Each registered physician receiving this list is requested to report to the secretary of the board and to the secretary of any duly incorporated

tion under this article, or under sections eleven hundred and forty-seven of the penal law, and any amendments thereto, is made on the complaint of any incorporated medical society of the state, or any county medical society entitled to representation in a state society, any fines collected shall be paid to the society making the complaint, and any excess of the amount of fines so paid over the expense incurred by the said society in enforcing the medical laws of this state, shall be paid at the end of the year to the county treasurer ]

1 Any person who shall,

(a) Sell or fraudulently obtain or furnish any medical or osteopathic diploma, license, record or registration, or aid or abet in the same, or

(b) Practice medicine under cover of any diploma, license, record or registration illegally or fraudulently obtained or signed or issued unlawfully or under fraudulent representation or mistake of fact in a material regard, or

(c) Advertise to practice medicine under a name other than his own or under a false or assumed name, and

2 Any person, who not being then lawfully licensed and authorized to practice medicine within this state and so registered according to law, shall

(a) Practice or advertise to practise medicine, or

(b) Use in connection with his name any designation tending to imply or designate him as a practitioner of medicine, or

(c) Use the title "doctor" or any abbreviation thereof in connection with his name or with any trade name in the conduct of any occupation or profession involving or pertaining to the public health, unless duly authorized by law to use the same, and

3 Any person, who during the time his license to practice medicine, shall be suspended or revoked shall practice medicine shall be guilty of a misdemeanor and shall also be subjected to the recovery of civil penalties

Such misdemeanor shall be punishable by imprisonment for not more than one year or by a fine of not more than five hundred dollars or by both such fine and imprisonment for each separate violation

4 All courts of special sessions within their respective territorial jurisdictions are hereby empowered to hear, try, and determine such crimes without indictment and to impose in full the punishments of fines and imprisonments herein prescribed

Such misdemeanors shall be prosecuted upon the private information of any person by the district attorney of the county wherein the same are committed and at any time the attorney-general

may, without further authority or direction, supersede the district attorney in the prosecution of such misdemeanors

5 In addition to the criminal punishments of imprisonment and fine as above provided, a civil penalty is hereby prescribed and imposed which shall be one hundred dollars for each such violation, to be recovered by the attorney-general in an action against the party or parties guilty of such violation, which action shall be maintained in the name of the people of the state of New York. Such civil penalties shall be cumulative, a separate penalty being recoverable for each separate violation, and each separate day's violation shall constitute a separate violation for which recovery may be had as above provided. The attorney-general, with the consent of the state commissioner of education may compromise claims for such penalties and accept less than the amount claimed or due before or after an action has been begun. No compromise may be made, however, after decision has been made or a verdict rendered, except pursuant to section thirty-four of the state finance law. Notwithstanding the provisions of any other general, local or special law, all fees, fines, penalties and other moneys derived from the operation of this article shall be paid to the regents of the university and shall be available, together with the appropriations made from time to time by the legislature, for the payment of all proper expenses of the regents, for the administration and enforcement of this act only, including the salary of any deputy attorney-general assigned for the purpose of enforcing the provisions of this article. The unexpended balance of all such fees, fines, penalties and other moneys derived from the operation of this article remaining on June thirtieth of each year shall be paid into the state treasury.

After this act shall take effect, the regents shall report to the state comptroller on the fifth day of every month the amounts received by them under this article and remaining in their hands, with all expenditures made by them for the preceding month.

6 Judgments for civil penalties recovered under this article may be enforced by execution against the person as provided in the civil practice act. A person taken into custody under such an execution shall not be admitted to the liberties of the jails and shall be confined, Sundays and legal holidays included, for not less than one day and at the rate of one day for each dollar of the amount of the judgment recovered for civil penalties and costs and remaining unpaid. No person shall be imprisoned more than once or for more than six months on the same judgment. The provisions of this article relative to imprisonment for such debts shall be exclusive and the provisions of the debtor and creditor law and of section seventy-two of the civil rights law shall

church, or (9) the fitting or selling of lenses, artificial eyes, limbs or other apparatus or appliances by any person or manufacturer of the same or the engaging in the mechanical examination of eyes for the purpose of constructing or adjusting spectacles, eyeglasses and lenses

II This article shall be construed to repeal all acts or parts of acts authorizing conferment of any degree in medicine *causa honoris* or *ad eundem* or otherwise than on students duly graduated after satisfactory completion of a preliminary medical course not less than that required by this article as a condition of license

It is further provided that any person who shall be actively engaged in the practice of osteopathy in the state of New York on the thirteenth day of May, nineteen hundred and seven, and who shall present to the board of regents satisfactory evidence that he is a graduate in good standing of a regularly conducted school or college of osteopathy within the United States which at the time of his or her graduation required a course of study of two years or longer, including the subjects of anatomy, physiology, pathology, hygiene, chemistry, obstetrics, diagnosis and the theory and practice of osteopathy, with actual attendance of not less than twenty months, which facts shall be shown by his or her diploma and affidavit, shall upon application and payment of ten dollars be granted, without examination, a license to practice osteopathy, provided application for such license be made within six months after the thirteenth day of May, nineteen hundred and seven. A license to practice osteopathy shall not permit the holder thereof to administer drugs or perform surgery with the use of instruments. Licenses to practice osteopathy shall be registered in accordance with the provisions of this article, and the word osteopath be included in such registration, and such license shall entitle the holder thereof to the use of the degree D O, or doctor of osteopathy

It is further provided that any person who shall have been continuously and actively engaged in the practice of chiropractic in the state of New York for a period of eight years on the first day of July, nineteen hundred and twenty-five, and who shall present to the regents satisfactory evidence that he or she is a graduate in good standing of a legally chartered school or college of chiropractic within the United States which at the time of his or her graduation required a course of study including the subjects of anatomy, physiology, pathology, hygiene, analytical chemistry, obstetrics and the theory and practice of chiropractic, which facts shall be shown by his or her diploma and affidavit, shall upon application and payment of a fee of ten dollars be granted, without examination, a license to practice chiropractic, provided application for such license be made within six months after the first day of July, nineteen hundred and twenty-five

It is further provided that the continuous practice of chiropractic for a period of eight years shall not apply to such practitioners of chiropractic who served the United States in the world war during this eight year period and who shall present evidence of such service and an honorable discharge. All other persons who are now engaged in the practice of chiropractic prior to the taking effect of this act shall take an examination to be provided for by the regents in the foregoing subjects, after, certifying by diploma and affidavit to the regents that he or she has graduated from a secondary school and from a chiropractic school or college in the United States with credentials satisfactory to the regents and from a course of satisfactory study of not less than eighteen months

A license to practice chiropractic shall not permit the holder thereof to administer drugs or to practice surgery or obstetrics. Licenses to practice chiropractic shall be registered in accordance with the provisions of this article and the word *chiropractor* shall be included in such registration and such license shall entitle the holder thereof to the use of the word *chiropractor* or *licensed chiropractor* and no others may use such word or words under the penalties of this article

§ 9 Section one hundred and seventy-four of such chapter is hereby renumbered section one hundred and seventy-three and amended to read as follows

§[174 Penalties and their collection] §173 *Penalties* [Any person who, not being then lawfully authorized to practice medicine within this state and so registered according to law, shall practice within this state without lawful registration or in violation of any provisions of this article, and any person who shall buy, sell or fraudulently obtain any medical diploma, license, record or registration, or who shall aid or abet such buying, selling or fraudulently obtaining, or who shall practice medicine under cover of any medical diploma, license, record or registration illegally, obtained, or signed or issued unlawfully or under fraudulent representations or mistake of fact in a material regard, or who, after conviction of a felony, shall attempt to practice medicine, or shall so practice, and any person who shall in connection with his name use any designation tending to imply or designate him as a practitioner of medicine within the meaning of this article without having registered in accordance therewith, or any person who shall practice medicine or advertise to practice medicine under a name other than his own, or any person not a registered physician who shall advertise to practice medicine, shall be guilty of a misdemeanor. Any person who shall practice medicine under a false or assumed name, or who shall falsely personate another practitioner or former practitioner of a like or different name, shall be guilty of a felony. When any prosecu-

such fact is certified on oath by any person duly authorized to make legal service, the secretary of the board of medical examiners shall cause to be published for at least four times, at least thirty days prior to the hearing, a notice of hearing, in a newspaper published in the county in which the physician was last known to practice, and a copy of such notice shall also be mailed to the accused at his last known address. All such notices of charges shall contain a plain and concise statement of the material facts, without unnecessary repetition, but not the evidence by which the charges are to be proven, with a notification that a stenographic record of such proceedings will be kept and that the accused will have opportunity to appear either personally or by counsel at the hearing, with the right to produce witnesses and evidence upon his own behalf, to cross-examine such witnesses, to examine such evidence as may be produced against him and to have subpoenas issued by the board. The said committee shall make a written report of its findings and recommendations, to be signed by all its members, and the same shall be forthwith transmitted to the board of regents with the entire record and evidence. If the said committee shall unanimously find that said charges, or any of them are sustained, and shall unanimously recommended that the license of the accused be revoked or the practitioner suspended from practice, and his registration annulled, or that he be otherwise reprimanded or disciplined, the regents may thereupon in their absolute discretion, revoke or suspend said license and annul said registration or otherwise reprimand or discipline as in their absolute discretion they may deem best for the public interest, provided that no greater penalty than that recommended by said committee be imposed. Where the license of any person has been revoked, or his registration has been annulled as herein provided, the regents may, after the expiration of one year entertain an application for a restoration of license and registration, in like manner as original applications for licenses are entertained, and upon such new application they may in their discretion exempt the applicant from the necessity of undergoing any examination. The regents may in their discretion restore to good standing any physician who has been suspended from practice.

1. Any licensed practitioner found guilty under the provisions of this section on charges or whose license is otherwise revoked or suspended or registration annulled or who has been refused registration, or who is otherwise reprimanded or disciplined by the board of regents under this article, shall have an order of certiorari for the purpose of reviewing such determination returnable before the appellate division of the judicial department where the board of regents made the determination complained of, but no such deter-

mination of the board of regents shall be stayed or enjoined except upon application to such appellate division, after notice to the state commissioner of education, and upon a showing that the determination of the board of regents was clearly wrong, that the constitutional rights of the applicant have been violated or that the board of regents made its determination without jurisdiction. The board of medical examiners or the board of regents may issue subpoenas and administer oaths pursuant to section sixty-one of the public officers law in connection with any hearing or investigation under this article and it shall be the duty of such boards to issue subpoenas at the request of and upon behalf of the defense.

§ 11 This act shall take effect July first, nineteen hundred and twenty-five.

*Comment.* This bill is by far the sanest bill which has thus far been introduced relative to the practice of any cult, but it too has a waiver clause not yet satisfactory though approaching more nearly to the thought of admittance of special practitioners in the healing art for license to practice the same.

Waiving the question for the sake of argument as to the all-curative properties of the chiropractic theory (which broad statement is denied by scientific men) this bill provides that examination shall be held by the State Board of Medical Examiners, first, that prior to July 1, 1925, where the examination be for an applicant to practice chiropractic the question papers shall be confined to the subjects of anatomy, physiology, hygiene, diagnosis and chemistry, then after that date the examination shall be the same as that prescribed for practitioners of osteopathy.

The first part of the bill is the same as the Karle-Dunmore bill.

The waiver clause, however, limits the practitioners who would come in thereby to those who have practiced for eight years and who shall present to the regents satisfactory evidence that he or she is a graduate in good standing of a legally chartered school or college of chiropractic within the United States, etc., and teaching certain subjects whereupon the payment of a fee of ten dollars and without examination a license may be issued up to and including the thirty-first day of December, 1925. The next provision is that all other persons now engaged in the practice of chiropractic must take an examination in the subjects as above described after certifying satisfactory to the regents that she or he has graduated from a secondary school and from a chiropractic school or college with credentials satisfactory to the regents.

The last sentence forbids the administering of drugs, the practice of surgery or obstetrics, requires registration according to the Karle-Dunmore bill, and the license thereunder entitles the

have no application and prosecutions for a crime under this article shall not bar prosecutions for civil penalties

7 The display of a sign or an advertisement bearing a person's name as a practitioner of medicine in any manner or by implication or containing any other matter forbidden by law shall be presumptive evidence in any prosecution or hearing that the person whose name is so borne is responsible for the display of such sign or advertisement and of a holding out and of the practice of medicine by such person for each separate day such sign or advertisement is anywhere displayed by anyone, but such presumptions are rebuttable by the defense. It shall be necessary to prove in any prosecution or hearing under this article only a single act prohibited by law or a single holding out or an attempt, without proving a general course of conduct, in order to constitute a violation

8 In any action for damages for personal injuries or death against a person not licensed hereunder for any act or acts constituting the practice of medicine as herein defined, where such injuries or death were contributed to by such act or acts, the fact that such person practiced medicine as herein defined without being duly licensed shall be deemed *prima facie* evidence of negligence

9 All violations of this act when reported to the regents and duly substantiated by affidavits or other satisfactory evidence, shall be investigated and if the report is found to be true and the complaint substantiated, the regents shall report such violation to the attorney general or district attorney and request prompt prosecution. The regents may appoint such inspectors as are necessary, to be paid from the funds received under this act at such salaries as the regents may determine and it shall be the duty of such inspectors under the direction of the regents, to investigate promptly and thoroughly such violations and to procure, where possible, legal evidence of the same for prosecution of the offenders

§ 10 Article eight of such chapter is hereby amended by adding thereto a new section to be known as section one hundred and seventy-four to read as follows

§ 174 *Revocation of certificates and annulment of registrations*

1 Whenever any practitioner of medicine shall be convicted of a felony, there may be presented to the regents a certified or exemplified copy of the judgment of such conviction and thereupon the registration of the person so convicted shall be annulled and his license revoked

Upon reversal of the conviction of such practitioner the regents shall upon receipt of a certified copy of the judgment or order of reversal vacate their order of revocation and annulment

of registration but nothing herein contained shall divest the regents of power to proceed against such practitioner under the next subdivision

2 The regents may revoke or suspend the license of a practitioner of medicine and annul his registration or reprimand or discipline as in their discretion they may deem best for the public interest in any of the following cases

Upon finding after due hearing

a That a physician is guilty of fraud or deceit in the practice of medicine or in his admission to the practice of medicine or in his procuring registration, or

b That a physician has been convicted in a court of competent jurisdiction, either within or without this state, of a crime involving moral turpitude, or

c That a physician is a habitual drunkard, or addicted to the use of morphine, cocaine or other drugs having a similar effect, or has become insane, or

d That a physician is guilty of untrue, fraudulent, misleading or deceptive advertising, or advertising that he can cure diseases which are recognized by the medical profession as incurable, or advertising that he can cure or treat disease by a secret method, procedure, treatment or medicine, or that he can treat, operate or prescribe for any human condition by a method, means or procedure which he refuses to divulge upon demand to the regents, or

e Who undertakes or engages in any manner or by any ways or means whatsoever to procure or perform any criminal abortion as same is defined by the penal law

3 Proceedings for revocation of a license, suspension of a practitioner from practice or the annulment of registration under subdivision two of this section shall be begun by filing a written charge or charges against the accused. These charges may be preferred by any person, corporation or public officer, or by the executive officer of the board of regents. Any charges shall be filed with the commissioner of education and a copy thereof filed with the secretary of the board of medical examiners. The president of the board of medical examiners, when charges are preferred, shall designate three of its members as a committee to hear and determine said charges and such committee shall contain at least one member who represents the same school of practice as the physician against whom the charges are preferred. A time and place for the hearing of said charges shall be fixed by said committee as soon as convenient, and a copy of the charges, together with a notice of the time and place when they will be heard and determined, shall be served upon the accused or his counsel at least ten days before the date actually fixed for said hearing. Where personal service or service upon counsel cannot be effected, and

*each county legislative chairman and individual in discussing medical and chiropractic legislation that the six bills pertaining to the practice of the healing art may not be confused, as is evidently the intent on the part of some, when in discussions the essential facts of differences in the bills are omitted perhaps to befog the mind of the discussors, and of the legislators when ultimate voting comes up*

### **The Periodic Health Examination of Food Handlers**

Int 678

IN ASSEMBLY,

February 3, 1925

Introduced by Mr Samberg—read once and referred to the Committee on Public Health

#### **AN ACT**

To amend the public health law, in relation to sanitation in ractories, stores and shops engaged in the business of selling food.

*The People of the State of New York, represented in Senate and Assembly, do enact as follows*

Section 1 Article seventeen-a of chapter forty-nine of the laws of nineteen hundred and nine, entitled "An act in relation to the public health, constituting chapter five hundred and fifty-two of the laws of nineteen hundred and thirteen," is hereby amended by inserting therein a new section, to follow section three hundred and forty-three-c, to be section three hundred and forty-three-d, to read as follows

§ 343-d Factories, stores and shops for sale of food, food to be examined Every person employed in preparing, packing or otherwise handling articles of food in every factory, store, shop or other place in this state, at the time of entering such employment, and at least every six months periodically thereafter, shall be examined by a physician duly licensed to practice medicine in this state. It shall be the duty of a physician making such examination to furnish a certificate stating whether or not the person examined by him is suffering from a communicable disease Any person suffering from such a disease shall not engage or be employed in the work mentioned in this section Any person, firm or corporation who employs a person who has not been examined as prescribed in this section or whose certificate of examination discloses that he is suffering from such a communicable disease, and any such person who engages in the work mentioned in this section without undergoing the examination required by this section or while suffering from such a communicable disease, shall be guilty of a misdemeanor

§ 2 This act shall take effect immediately

*Comment* Through error this bill was omitted and is now printed for the information of the profession

While theoretically the bill is excellent for the protection of the public health there are only a few of the communicable diseases which might be discovered at each six months' examination

—See concurrent Senate Int 302, for digest and comment

#### **Medical Examination in Schools**

Assembly Int No 850 (conc Senate Int. 586)

—See concurrent Senate 586 for digest and bill printed.

#### **Physically Handicapped Persons**

Assembly Int. No 868 (conc Senate 671)—

See concurrent Senate 671 for digest and printed bill

#### **Regulating Sale of Wood or Methanol Alcohol**

Assembly Int No 908—A bill introduced in the Assembly by Assemblyman Frank H Lattin of Orleans County, would add new sections 416, 447, 447-a Penal Law, forbidding sale of wood or methyl alcohol except as methanol, and making it a felony to sell goods or drink or medicinal or toiled preparations for internal use in which there is methanol.

Referred to Codes Committee

*Comment* It is to be hoped that this bill will find a concurrent number in the Senate and see the light of day

#### **Relative to Those Who Have Received Licenses in Other States**

Assembly Int No 925—A bill introduced in the Assembly by Assemblyman Edward J Coughlin of Brooklyn, N Y, would amend section 169, Public Health Law, relative to licenses to practice medicine who have received the license in another state

Referred to Public Health Committee

No further comment as yet

#### **Rural Hygiene**

Assembly Int No 969 (conc Senate Int. 716)

—See concurrent Senate Int 716 for digest

#### **Dissection of Dead Bodies**

Assembly Int No 986 (conc Senate Int 681)

—See concurrent Senate Int. 681 for digest

#### **The Birth Control Bill**

Assembly Int No 987—A bill introduced in the Assembly by Assemblyman John Boyle, Jr, of Suffolk County, would amend section 1145,

holder to the use of the word "chiropractic" or "licensed chiropractor"

It will be seen that more and more those who would hurdle the present law must come up to reasonable requirements in preliminary education, to reasonable requirements in health and education along the basic lines of science, to be graduates of real schools or colleges if there be such who are honestly teaching the basic laws of science and yet who believe in the all-curative thought of this cult, following this thought fanatically as in the history of other cults

It is a safe prediction for one to make that eventually those who have studied the basic principles of medicine and have been licensed as medical practitioners and who have honestly believed, though perhaps deluded in mind, special cult practice followed by some, whatever it may be, will declare themselves and come out with a demand that all of their specialist brother and sister practitioners shall take the same road which they traveled, but perhaps with minor exceptions, and arrive at their journey's end in an honest, legal and definite manner such as to win approbation not alone of the lay people, but of all scientific groups

#### **Health Service in Schools**

Assembly Int No 127—Referred to Public Education Committee

*Comment* This bill is slowly moving though no concurrent bill has appeared in the Senate and as a consequence must be watched with keen sight and be opposed vigorously by County Legislative Chairmen as has been suggested before

#### **Practical Tests of Injured Persons**

Assembly Int No 184 (conc Senate Int 647)  
—See concurrent Senate Int 647 for digest and comment

#### **The Nicoll Chiropractic Bill**

Assembly Int No 185—A bill introduced in the Assembly by Assemblyman William Nicoll of Schenectady County, would define and regulate the practice of chiropractic

Referred to Public Health Committee

*Comment* See other chiropractic bills for comment

#### **The Narcotic Bill**

Assembly Int No 215 (conc Senate Int 115)  
—See concurrent Senate Int 115 for digest and comment

#### **Requiring the Licensing of Private Institutions for the Treatment of Drug Addicts**

Assembly Int No 216 (conc Senate Int 116)  
—See concurrent Senate Int 116 for digest and comment

#### **Supervising Education of Children With Retarded Mental Development**

Assembly Int No 229—A bill introduced in the Assembly by Assemblyman A Spencer Feld of New York County, would add new section 579a Education Law, providing for county supervisors to supervise education of children with retarded development

Referred to Public Education Committee

No further comment

#### **Empowering State Charities Board to Inspect Children's Institutions**

Assembly Int No 236 (conc Senate Int 228)  
—See concurrent Senate Int 228 for printed bill and comment

#### **Free Choice of Physician**

Assembly Int No 301 (conc. Senate Int. 594)  
—See Senate concurrent No 594 for printed bill and comment

#### **The State Department of Education Bill Amending the Medical Practice Act**

Assembly Int No 307 (conc Senate Int 211)  
—See concurrent Senate Int 211 for digest and comment

#### **County Public Health Nurses**

Assembly Int No 399 (conc Senate Int. 283)  
—See concurrent Senate Int 283 for digest and comment

#### **Disclosure of Confidential Communications**

Assembly Int No 422—A bill introduced in the Assembly by Assemblyman Samuel Rosenman of New York County would amend section 352, Civil Practice Act, by providing physicians and nurses may disclose professional information as witnesses in action to annul marriage on ground of fraud

Referred to Codes Committee

*Comment* It is again asked if the County Chairmen have written to the Assembly Codes Committee as requested in opposition to the bill

#### **Free Choice of Physician**

Assembly Int No 570 (conc Senate Int 380)  
—See concurrent Senate Int 380, for digest and comment

#### **The Chiropractic Bill**

Assembly Int No 649—A bill introduced in the Assembly by Assemblyman Burton D Esmond of Saratoga County would amend sections 164, 169, 170, 173, adding new article 8-b, Public Health Law, relative to the practice of medicine and to chiropractic

Referred to Public Health Committee

*Comment* Again your Committee on Legislation would call attention to the fact that *extreme caution and precise care must be used by*

§ 4 Section three hundred and eighty-five of such chapter, as added by chapter six hundred and nineteen of the laws of nineteen hundred and thirteen, is hereby amended to read as follows

§ 385 Registration of physicians, midwives, and undertakers Every physician, midwife and undertaker shall, on or before the day on which this article takes effect, register his or her name, address and occupation with the registrar of the district in which he or she resides, and shall so register in any district in which he or she may hereafter establish a residence *or maintain an office*, and shall thereupon be supplied by the registrar with a copy of this article, together with such rules and regulations as may be prepared by the public health council relative to its enforcement Within thirty days after the close of each calendar year each registrar shall make a return to the State Commissioner of Health of all physicians, midwives, [or] *and* undertakers who have been registered in his district during the whole or any part of the preceding calendar year, provided, that no fee or other compensation shall be charged by registrars to physicians, midwives or undertakers for registering their names under this section or making returns thereof to the State Commissioner of Health

§ 5 Section three hundred and eighty-seven of such chapter, as added by chapter six hundred and nineteen of the laws of nineteen hundred and thirteen and amended by chapter four hundred and fifteen of the laws of nineteen hundred and twenty-two, is hereby amended to read as follows
